97.57 per cent of the total shown is either produced at [fol. 4715] the ports and as to which the rail lines would have no opportunity to obtain a haul when for export or, if handled to the ports via rail, would be on the basis of special commodity rates bearing no relation to class rates and containing no Florida arbitrary. This does not mean that the remaining 2.43 per cent would move on basis of class rates or would contain an arbitrary.

For example, of the 18,802 tons of commodities, not otherwise named, shown as being exported through Miami, some of the items which originate at Miami include, as shown on page G-33 of Witness Grady's Exhibit No. 95, 7,706 tons of boiler water, 2178 tons of drinking water, 1,110 tons of ice, 160 tons of feed and 90 tons of beer. That is nearly 60 per cent of the miscellaneous commodities shown as exported through Miami.

Likewise, to Miami, one of the larger unspecified items consisted of 1,171 tons of automobiles and parts. There are specific commodity rates on automobiles and parts from

Central Freight Association producing points to Miami which bear no relation to the class rates and do not include a Florida arbitrary, but, if these automobiles and parts moved from Central Freight Association points directly to Miami billed for export, they would have moved on class rates which are governed by Official Classification and are related to the export rates from such origins to New Orleans, Louisiana, the latter in turn being related to the rates from [fol. 4716] Central Freight Association origins to New York, N. Y., and Baltimore, Maryland.

The movement of commodities not otherwise named to Panama City, Jacksonville and Pensacola, for export, when from origins north of the Florida peninsula, would not be subject to the Florida arbitrary even if they moved on full class rates. Class and commodity rates are published from Central and Illinois Freight Association territories to Jacksonville, Pensacola and Panama City for export, which are made with relation to the rates from such origins to New Orleans, Louisiana; Baltimore, Maryland, and New York, N. Y., for export, such export class rates being governed by Official Classification, and, of course, none of them including a Florida arbitrary.

A careful analysis shows that less than 5 per cent, and probably less than 1 per cent of the commodities shown as being exported through the Florida ports, when moving via rail, would move on class rates or would include a Florida arbitrary.

Pages 16, 17 and 18 of my exhibit, covering the imports through the Florida ports, show very nearly the same sort of picture as I have just mentioned regarding the exports. Over 33 per cent of the imports is of fertilizer and fertilizer materials, which, when moving inland by rail, move on commodity rates bearing no relation to class rates and contain no Florida arbitrary.

Suffice it to say that a study of this exhibit will disclose slightly over 88 per cent accounted for as traffic which re- [fol. 4717] mains at the port of import, or, if moving via rail to interior points, moves on commodity rates bearing no relation to class rates, and containing no Florida arbitrary. This does not mean that nearly 12 per cent does move on class rates or on rates containing a Florida arbitrary.

To illustrate, of the creosote oil which is imported through Pensacola none is likely to move to a Florida peninsula Point, and that imported through Jacksonville would be used principally at Jacksonville or shipped via rail to other points at which creosoting plants are located, only one of which is in Florida peninsula territory, and the Florida arbitrary on creosote oil from Jacksonville to that point is only 1 per cent per 100 pounds.

The beet pulp imported through Jacksonville, Miami and Tampa would nearly all remain at those ports. Much of the tonnage included under the heading "other commodities" would be used at the port.

For example, at Tampa among the items included under this head are 1,617 tons of tobacco, 1,072 tons of iron and steel articles. Much of the miscellaneous imports shown through Jacksonville would, if shipped out, find their destination at points north of Florida, and would move on commodity rates bearing no relation to class rates or perhaps to Central or Illinois Freight Association territories on class rates which are governed by Official Classification and are [fol. 4718] made with relation to the import class rates from New Orleans, Louisiana; Baltimore, Maryland, and New York, N. Y.

I have not included in these statements dealing with the distribution and rate adjustment on the exports and imports through Florida ports the Key West figures because that port is not served by a rail line; nor have I included the figures via Port Everglades on traffic moving via the Florida East Coast car ferry because class and commodity rates having no relation to the Docket 13494 class rates, and containing no arbitrary have been established for the movement of practically all of the traffic which is handled through Port Everglades in connection with the car ferry.

So far as concerns the coastwise and intercoastal movements from, to or through the Florida ports, we have no figures segregating the commodities so handled. It is obvious that the outbound movement from or through the ports in coastwise or intercoastal traffic will follow closely the same pattern as that for export traffic with the possible exception that pulpboard and other paper articles, naval stores and canned goods would show a slightly higher percentage of total movement, and lumber and scrap iron would show a lesser percentage of the total movement than is the case for export.

As to the inbound coastwise or intercoastal movement, the showing would be very different from that for the imports, because there is regular service, during normal times, [fol. 4719] between Florida ports and the eastern port cities, and frequent though irregular service between the larger Florida ports and the Pacific Coast. Also during normal times there are both regular and irregular steamship or barge services between certain of the Florida and Gulf ports.

The rates assessed by the water carriers between ports are generally so low that the railroads cannot meet them.

On pages 19, 20, 21 and 22 of my exhibit, I have shown the class rates applicable via all-water routes between eastern port cities and Jacksonville, Miami and Tampa, Florida, and have compared therewith the present all-rail rates and what the all rail rates would be if made on basis of the Southern class rate scale or the Official territory class rate scale, and have also shown, at the bottom of the pages showing the class rates, representative commodity rates published by the steamship lines and the Classification or exception sheet rating governing all-rail traffic.

As illustrative of the showing in these pages, not the situation between Jacksonville, Florida, and New York, N. Y., shown on lines 9 through 13 on page 19. The first class all-water rate is shown to be 146 cents, the all-rail rate to be 220 cents, the rate on the Southern or Docket 13494 K-2 scale 245 cents and the rate on the Official Territory or Docket 15879 Appendix E scale to be 179 cents.

The first class all-water rate is lower by 33 cents per [fol. 4720] 100 pounds than the Official territory level, and the present all-rail first class rate is 25 cents per 100 pounds lower than the Southern level, no Florida arbitraries being here considered.

At the bottom of that page, note, for example, at line 33, the steamer lines publish northbound rate of 34 cents per 100 pounds on canned goods, carload. The exception sheet rating for this commodity on all-rail is Class 30-K, which represents eighth class to reflect 5 per cent increase under Ex Parte 123. Class 30-K applied against the all-water first class rate from Jacksonville, Florida, to New York, N. Y. would be 42 cents, the northbound commodity rate being, therefore, 8 cents lower than the all-water class rate.

The exception sheet rating in Official territory on canned goods, carload, in Class 32-S, which represents 32 per cent of the first class rate prior to Ex Parte 123 increase, increased 5 per cent, but not exceeding an increase of 2 cents per 100 pounds. The Class 32-S figure under the Official territory level of rates for all-rail distance would be 54 cents per 100 pounds or 20 cents per 100 pounds higher than the all-water rate from Jacksonville, Florida, to New York, N. Y. on canned goods.

The showing here mentioned as between Jacksonville, Florida, and New York, N. Y. will apply in greater or lesser degree to the balance of the figures shown on these three pages.

[fol. 4721] The steamer lines publish several pages of commodity rates, most of them considerably lower than would result from their already low line of class rates.

The situation as to rail-water rates and movements from points in Official territory to Florida ports from interior Florida points to eastern ports via rail-water, from eastern parts to interior Florida points via water and rail, or from the Florida ports to interior Official territory points via water and rail is very much the same as that via the all-water routes between the ports, in that the through rates via the rail-water or water-rail routes, whether published as one-factor through rates or obtained by combination over the ports, are generally too low to permit the all-rail routes to meet them.

I would cite here the handling before the Commission in Fourth Section Application 13819, commodity rates to South Atlantic and Florida ports, reported in 186 ICC 675, 197 ICC 309, 214 ICC 7 and 222 ICC 427. There, the rail lines sought authority to meet the rates available on combination for the rail-water service through the North Atlantic ports on commodities from Central and Illinois Freight Association points to the South Atlantic and Florida ports. The Commission did not grant the relief sought, but did grant Fourth Section relief to establish all-rail rates made 10 per cent higher than the combination available via the rail-water routes.

[fol. 4722] Commodity rates were established pursuant to the relief granted on a rather long list of commodities, but the result of the establishment of such rates has been most disappointing to the South Atlantic and Florida port lines. We have kept records of all movements under the rates so established, and except to Miami, the rail routes have recaptured only a small portion of the movement for which such rates were intended.

At pages 4 through 10 of Witness Donnell's Exhibit 93 are shown graphs and figures comparing tonnage originated or terminated in Florida with the figures for certain other states. He does not, on these pages, show the comparisons of Florida with all of the other states, in some instances omitting comparisons of Florida with some of the other Southern states.

In order to have a complete picture as to the tonnage originated and terminated in all of the states, and the tons per mile originated and terminated in all of the states, I have shown at pages 22 and 24 of my Exhibit No. 202 such a comparison. The only comment which it seems necessary to make here is that the tons originated or terminated per mile of road within the state have much more meaning than the tons originated or terminated per state.

For example, where on page 4 of Exhibit No. 93 it is shown that Florida originated 15 per cent more rail tonnage than did New Jersey in the year 1940, the salient fact [fol. 4723] is that, as shown on page 22 of my exhibit, New Jersey originate 115 per cent more rail tonnage per mile of road in 1940 than did Florida.

The real test, however, of traffic density is the tons handled per mile of road, and I have, at pages 8, 9, 10 and 13 of my prior exhibit No. 70 shown such comparisons for many years of the tonnage handled in Florida with tonnage handled in the other states served by the Atlantic Coast Line Railroad and Seaboard Air Line Railway.

While at pages 23 and 24 of my exhibit the showing as to tons originated and terminated in Florida indicate a rather high rank for Florida as compared with the other Southern states, the reverse is true when total tonnage handled is taken into consideration.

Witness Donnell in answer to questions on cross-examination at page 1892 of the transcript, stated that there is very little overhead traffic in Florida but its traffic originating and terminating traffic builds up the density of the traffic in the Carolinas, Virginia and Georgia, and again, at page 1894 of the transcript, he stated, "North Carolina will always, a million years from now, have more density than Florida because the more tonnage we originate, the heavier density North Carolina's density becomes."

Admitting that the fruit and vegetable tonnage originating in Florida contributes valuably to the overhead traffic [fol. 4724] handled through other Southern states, and that, in normal times, from 10 to 15 per cent of the phosphate rock originating in Florida contributes to the tonnage handled through other Southern states, I would like to show that a great portion of the tonnage originating in Florida terminates in Florida, and, therefore, by far the greater part of the tonnage originated in Florida does not contribute to the tonnage handled in the other Southern states.

On page 25 of my exhibit I have shown for commodities the tons originated and tons terminated in Florida for the year 1940. These figures show that the tonnage originated corresponded to a marked degree with the tons terminated in Florida.

I have already shown that, as to phosphate rock, the total amount originating in Florida and which moved to other than are known to be Florida destinations, the percentage via the Atlantic Coast Line Railroad in 1939 was 10.75 per cent and in 1940, 14.05 per cent. There are interior Florida fertilizer mixing plants to which there is a movement of phosphate rock from Florida origins and that movement would be included in the 10.75 per cent or 14.05 per cent.

As to lumber, I have recently participated in hearings before the Florida Railroad Commission concerning the intrastate rates on lumber and related articles within Florida, and am in position to say that, by far the greater portion [fol. 4725] of that tonnage originating in Florida terminates in Florida.

On petroleum and its products nearly all that is used in Florida comes by water to the Florida ports and is either used at the port or distributed inland from those ports.

Most of the fertilizer used in Florida is produced in Florida.

Of the other commodities shown on this page, it is obvious that from the very nature of the commodities they can move only for short distances. It is shown that these ten commodities accounted for slightly over 80 per cent of the tonnage originated in Florida and slightly over 75 per cent of the traffic terminated in Florida. This enormous tonnage originating in Florida and terminating in Florida adds very little to the traffic handled through or originating or terminating in the other Southern states.

On this point I think it well to mention that the rates on these commodities within, to or from Florida are commodity rates, exceedingly low in level, and that no Florida arbitrary is to be found in the rates on which any of these ten commodities move; except on gravel, sand, and broken, crushed or ground stone, and the arbitraries on these commodities are so low it is almost impossible to find them.

As showing the low earnings on sand, gravel, crushed stone and phosphate rock for the tons handled in Florida, attention is called to page 26 of my exhibit, which shows [fol. 4726] such information for the Atlantic Coast Line Railroad, and the Seaboard Air Line Railway for the year 1940, and in comparison similar figures for the Louisville and Nashville Railroad and for the Southern Region as a whole. The average revenue for the Atlantic Coast Line and Seaboard Air Line in Florida on these commodities is shown to be 71.4 cents per net ton which is less than 6 per cent of the first class rate for a forty mile haul under the Docket 13494 K-2 scale prior to Ex Parte 148 increase without a Florida arbitrary.

At pages 8 and 9 of Witness Donnell's Exhibit No. 93, he makes comparison of the freight originated and terminated in Florida for the year 1940 in Florida with similar figures for the New England States. Further comparison of Florida with the New England States is interesting and perhaps helpful because there are many characteristics, both from the standpoint of geography and railroad statistics. which in the two areas are comparable.

I have set down some of these as well as some points of difference on page 27 of my exhibit. Florida and the New England States are very nearly equal in land area, in miles of railroads, in square miles of land area to miles of railroad and in tonnage originated. However, in tonnage terminated and in total tonnage originated and terminated there is a marked difference as will be seen from page 27 of the exhibit. While Florida in 1940 originated 7.3 per cent more rail tonnage than did New England, New England [fol. 4727] land terminated 125.3 per cent greater rail tonnage than did Florida, and, for combined originated and terminated tonnage, New England had 59.1 per cent more than Florida.

Two other points of peculiar similarity are found as between Florida and New England. Florida, being a peninsular state, the most southeastern state in the Union, has very little opportunity to have its traffic density increased by reason of overhead traffic. New England, being at the northeastern corner of the United States likewise has very little opportunity to have overhead traffic add to its traffic density, though since it adjoins Canada the opportunity there is somewhat greater.

Again, in New England as in Florida we find a portion of the area is subject, as to freight rates, to arbitraries over and above the level generally existing in the territory with which each area is grouped. In Florida there are 44 counties which lie wholly in the arbitrary territory, and these counties have a land area of 38,224 square miles. In the states of Maine, New Hampshire and Vermont, there are thirty counties lying wholly within the arbitrary territory, having a land area of 41,560 square miles.

At pages 1871 and 1872 of the transcript, Witness Donnell refers to the great increase in the total tons of revenue freight carried in the state of Florida in the year 1940 over [fol. 4728] that in the year 1921, the figures showing that increase to be 112 per cent.

The decision of the Interstate Commerce Commission in Docket 13494, as regards the rates to and from south Florida and the arbitraries which might be added to the basic rates, was not determined on basis of the 1921 traffic sho-ing. Rather, at page 622 of its decision in Docket 13494, 100 ICC 513, it makes comparison of the traffic density of Florida with other Southern states for the years 1922 and 1923.

I have shown at page 28 of my exhibit for account of the Atlantic Coast Line Railroad, and at page 29 for account of the Seaboard Air Line Railway, the comparison of revenue tons carried, average miles of road operated, and revenue tons carried per mile of road, in the six Southern states through which those roads operate, for the years 1922, 1923, 1924, 1925 and 1940. These figures show that the Atlantic Coast Line Railroad handled in 1940 less revenue tons per mile of road in Florida and in the other states than it handled in 1923, 1924 or 1925, except as to Alabama. The Seaboard Air Line Railway in 1940 handled per mile of road in Florida in 1940 less than it did in 1924 or 1925, and only 24 tons more per mile of road in 1940 than it did in 1923.

I have included in these two pages the figures for the years 1924 and 1925 because whether or not the Commission made reference to the figures for those years in its final [fol. 4729] decision dealing with the arbitraries in connection with the Florida rates under Docket 13494, it had those figures available at the time of its decision reported at 128 ICC 567, which was decided July 19, 1927.

Pages 8, 9 and 10 of my prior Exhibit No. 70 show the figures for the Atlantic Coast Line Railroad for the intervening years 1926 through 1939, and page 13 of my exhibit No. 70 shows for account of the Seaboard Air Line Railway the figures for the years 1929 through 1939.

In Exhibit No. 93, Witness Donnell refers to the low number of railroad employees per mile of road in Florida as compared with 38 other states. Aside from the obvious fact that this showing is indicative of lighter traffic density I would point out that his figures are based on first, main track, rather than miles of road, and are for the month of July, 1940.

The number of employees is affected, particularly as to maintenance of way employees, by the second, third and fourth main tracks and it will be seen from page 2 of his Exhibit No. 93 that the states having the greatest number of employees per mile of road are those states in which the greatest amount of second, third or fourth main line tracks are maintained.

July is one of the three lightest months, from the standpoint of traffic handled into or out of Florida. As shown [fol. 4730] by page 7 of my exhibit, for the year 1939, July was the third to the lightest month and in 1940 second to the lightest month in tonnage handled over the Atlantic Coast Line Railroad, excluding phosphate rock. There can be no doubt that a somewhat different showing would have been made had his figures been for one of the months during the first or last quarters of the year.

I would also call attention to the fact that the number of railroad employees in any state will be influenced materially by the location therein of general offices of Class I railroads. In Florida only one Class I railroad has its general offices, namely, the Florida East Coast Railway. In Georgia there are located the general offices of the Central of Georgia, Atlantic, Birmingham & Coast Railroad, Georgia Railroad-West Point Route, Charleston & Western Carolina Railway, Georgia and Florida Railroad, and a large portion of the general offices of the Southern Railway.

It will be noted that the number of employees in South Carolina, per mile of line, is not shown in the exhibit, this being one of the states which had fewer employees per mile of road in July, 1940, than did Florida. The general offices of no Class I railroad are located in South Carolina.

In North Carolina, which is well down the list, are the general offices of the Atlantic Coast Line Railroad.

In Alabama, also well down the list, are the general [fol. 4731] offices of the Gulf Mobile & Ohio Railroad, and the Alabama, Tennessee and Northern Railway.

In Virginia, which is high up on the list, are to be found the general offices of the Norfolk & Western Railway, Seaboard Air Line Railway, Virginia Railway, Norfolk Southern Railway, and Richmond, Fredericksburg & Potomac Railroad.

In Maryland, which heads the list, and which, being a small state in area, has a much smaller total amount of first main line track than most of the other states shown, will be found the general offices of the Baltimore & Ohio Railroad, and Western Maryland Railway.

At page 3 of Exhibit No. 93, Witness Donnell shows the relatively small railway tax accruals per mile of line owned in Florida as compared with 45 other states. On this point the tax accruals compared with revenue earned is of equal value, and I have shown such information at page 30 of my Exhibit No. 202.

On page 4 of Exhibit No. 94, Witness Donnell shows that, from eight origins in the Florida pebble rock district to Tampa, Florida, the rate on phosphate rock for export, prior to Ex Parte 148, was 75 cents per gross ton and that the weighted average haul is 32 miles, his figures being quoted from 243 ICC 544.

He failed, however, to show that the rate of 75 cents per gross ton is also applicable to Port Tampa, for export, [fol. 4732] and that at the same page in the Commission's report it is show- that the weighted average haul to Port Tampa is 50.7 miles; likewise he failed to show that at the same page of that ~~report it is~~ shown that the same rate of 75 cents per gross ton mile applies to Tampa and Port Tampa when for coastwise movement beyond and that the weighted average haul when for coastwise movement is to Tampa 37 miles, and to Port Tampa 52.4 miles.

Again I call attention to the fact that in this decision, 243 ICC at page 541, it is shown that in 1936 the phosphate rock moving through Tampa and Port Tampa was handled for a weighted average distance of 44.8 miles, and in 1937 for a weighted average distance of 43.7 miles. As a matter of fact, the rate of 75 cents per gross ton applies also to South Boca Grande, for export or coastwise movement, from origins on the Seaboard Air Line Railway, the distances to South Boca Grande ranging from 94 to 110 miles.

It is shown at page 541 of the Commission's report referred to that in arriving at the weighted average distance to Tampa and Port Tampa, it was assumed that all the shipments which had moved for the greater distance to South Boca Grande had instead moved to Tampa. The report referred to is Docket 27723, Phosphate Export Association, et al. v. Atlantic Coast Line R. R. Company, et al., which attacked rates from these Florida origins to only Tampa and Port Tampa, when for water movement be-[fol. 4733] yond.

The following is quoted from that decision, beginning at the bottom of page 536:

> "We have given the evidence before us careful thought, and even though the South Boca Grande situation and the wet rock movement be eliminated from consideration, the record is not convincing that the assailed rates and charges exceed the maximum limit of reasonableness."

Another witness will deal generally with the testimony and Exhibit No. 92 introduced by Witness Maurer. On pages 104 through 112 of that exhibit, and also dealt with by Witness Eutsler, reference is made to rates on a few manufactured commodities from specific origins, many of which are local to the Atlantic Coast Line Railroad, and I do wish to have something to say about these.

On pages 105 and 107 of Witness Maurer's Exhibit No. 92 there are shown rates on palmetto brush fibre, less carload, and on fibre brushes, less carload, from Jacksonville, Otter Creek and Benson Junction, Florida, to Chicago, Illinois, and three Central Freight Association points, as compared with rates on the Docket 15879 level. A careful search of our files indicates that at no time have shippers' organizations nor manufacturers of palmetto fibre or fibre brushes located at any of these three Florida origins ap-[fol. 4734] proached us about rates.

In so far as concerns the Otter Creek adjustment, there is nothing regarding that in our files, although Otter Creek is a local station on the Atlantic Coast Line Railroad.

The Jacksonville operation first came to our attention in 1939 when our Jacksonville representative advised us that a firm was considering putting up a plant of this kind at Jacksonville, that report indicating that the prospect had not approached the railroads, but had approached a steamer line for establishment of a rate to New York City.

We figured closely on a rate that we might be able to establish which would result in rail handling of this movement but gave up when we found that the Clyde-Mallory Line published a rate of 35 cents at minimum weight of 20,000 pounds, and a rate of 47 cents on less than carloads.

The short line distance from Jacksonville to New York is 967 miles, and the minimum per car revenue at 35 cents per 100 pounds, minimum 20,000 pounds, would be only $70, yielding slightly under 7¼ cents per car mile for the shortest physical distance. It would take a rate of 53 cents per 100 pounds to yield, for the short physical district, per car mile revenue of 12 cents, and the Commission has several times denied Fourth Section relief, regardless of the degree of circuity, for rates yielding less than 12 cents per car mile. We have not at any time been approached by — shippers organization nor by the manufacturer of palmetto fibre or fibre brushes at Jacksonville, with regard to freight rates.

Benson Junction, another point at which these commodities are made, is a point reached by both the Atlantic Coast Line Railroad, and the Florida East Coast Railway. At no time have we been approached, by the shipper or a shippers' organization, to adjust the rates on these commodities from that origin. Our agent at Benson Junction did take up with us on two occasions, asking us to look into the question of rates to see if we could establish such rates as would divert to rail handling the traffic which then was moving principally by truck or truck and water service.

On both occasions we approached the shippers to ascertain what rates would be necessary to divert the traffic to rail handling, but were unable to obtain such information. One one occasion, however, we were informed that, even if the rail lines met exactly the rates available by truck and water, the rail lines would not be given the business.

Later, at our request, the shippers advised us that they would give us information as to movements and destinations so that we could make a further attempt to progress the matter, but we were never furnished such figures.

At page 108 of Witness Maurer's Exhibit No. 92 he shows rates on candied, crystallized or galazed citrus fruit from Davenport, Florida, to representative Southern points. He [fol. 4736] overlooked that effective in May, 1942, the rating on this commodity within the South, and between the South and Official territory was reduced to Class 57.

I have reproduced page 108 of Exhibit No. 92, and have added thereto figures on the Class 57 basis, this being shown at page 31 of my exhibit. I call attention to the fact that the reductions made in May, 1942, amount to very considerably more than the Florida arbitrary which was included in the rates prior to that time. I have been unable to find where we have ever been approached by a shipper or a shippers' organization for an adjustment in the rates on candied, crystallized, or glazed citrus fruits from Florida points to the South or to Official territory.

Witness Maurer, at page 110 of his exhibit, makes comparison of the rates on furniture, carload, minimum weight 10,000 pounds, from Palatka, and Tampa, Florida, to four representative destinations in Central-Illinois Freight Association territory with rates if made on the Docket 15879 level and with rates from Gardner, Massachusetts.

Witness Eutsler refered to this commodity as being shipped from Tampa and Palatka, Florida, at pages 1949 through 1953 of the transcript. At page 1952 he states that the concern manufacturing furniture at Palatka, Florida, originally manufactured cypress lawn and garden furniture, but that the all-rail rates were so high that when added [fol. 4737] to the cost of the furniture its products were excluded from the interior portions of the country, and that early in 1930 it turned to its present line of solid wooden bedroom and dining room furniture.

We were approached by the manufacturer at Palatka for an adjustment in the rates on lawn and garden furniture to points in Official territory. That was just about the time that both the Official territory and southern roads were looking *in to* the question of rates on furniture necessary to meet truck competition, which resulted in the establishment, effective in September, 1932, of Class 58, at minimum weight of 10,00 pounds, within the South and from the South to the

North. The Official territory roads, also in an effort to meet truck competition, reduced their ratings to 70 per cent of first class. These are the ratings which are still applicable on furniture at minimum weight of 10,000 pounds, as is seen from Witness Maurer's Exhibit No. 92, page 110. The same ratings apply on wooden garden or lawn furniture as on bedroom or dining room furniture.

Attention is called to the showing on page 110 of Exhibit No. 92 that by reason of the rating of 58 per cent of first class from the South, and 70 per cent of first class in Official territory, the rates from the Florida points to Central Freight Association points exceed the Central Freight Territory level by amounts ranging from only 20 [fol. 4738] per cent to 24 per cent.

To Trunk Line territory, where the class rates are on the key point basis, the excess over the Official territory scale is much less, as for example it can be readily figured from page 21 of my exhibit that from Tampa, Florida, to New York, N. Y., the excess over the Official territory scale is less than 14 per cent.

Attention is called to the fact that the rates on wooden garden or lawn furniture are the same as on other wooden furniture and, therefore, the conclusion is inescapable that it was not the rates which caused the manufacturer at Palatka to switch from making of garden or lawn furniture to the making of bedroom or dining room furniture.

I cannot locate where we have ever been approached by the manufacturer of furniture at Tampa or by a shippers' association for an adjustment in the rates from that point. However, when the truck competitive rates on furniture were established from Southern points it included the rates from Tampa as well as from other Southern points.

At page M-112 of Witness Maurer's Exhibit No. 92, he shows the rates on cigars, less carload, from Jacksonville and Tampa, Florida, to five Central-Illinois Freight Association destinations, as compared with rates from New York and with the Docket 15879 scale of rates.

Dealing first with the rates from Tampa, I would mention [fol. 4739] that in so far as the East is concerned, the movement has been practically all by all-water route or via rail to Jacksonville thence water beyond, until cessation of water service by reason of war conditions.

As is shown at page 21 of my exhibit, the all-water first and second class rates from Tampa to the Eastern port cities are on an extremely low level as compared with any existing level of all-rail rates, the first class rates via all-water to Boston and New York being respectively 26 cents and 7 cents per 100 pounds lower than the Docket 15879 Appendix E first class scale, and to Philadelphia and Baltimore the rates being only 4 cents and 15 cents, respectively, higher than the Docket 15879 Appendix E first class scale.

Commodity rates much lower than the class rates are, however, published via the all-water routes as, for example, rate of 110 cents per hundred pounds from Tampa to Baltimore, Maryland, and Philadelphia, Pennsylvania, is published in Item 1100 of Bull Steamship Lines' Tariff BL-20-E., U.S.M.C. No. 84, and there is published in Item 3180 of Pan-Atlantic Steamship Corporation ICC No. 84, rates of 110 cents per 100 pounds to New York, N. Y., Philadelphia, Pennsylvania, Hoboken and Camden, N. J., and rate of 114 cents per 100 pounds to Boston and New Bedford, Mass. These all-water commodity rates range from 42 cents to 78 cents lower than second class rates under the Docket 15879 Appendix E for the rail distance from [fol. 4740] Tampa to the Eastern ports. We would not meet rates such as these via all-rail routes, but we did establish commodity rate of 134 cents per 100 pounds for application via rail to Jacksonville, thence water lines beyond to New York and some of the other Eastern ports on which, account of the quicker service, the rail lines did handle a fairly good portion of that traffic.

From Tampa to Central-Illinois Freight Association territory, truck competition began to be noticed about 1932 or 1933, and we have been much concerned since that time with the recapture of this tonnage, keeping closely in touch with the volume of tonnage moving both by rail and by truck. Chicago, is, of course, the principal destination point in Central-Illinois Freight Association territory.

After extended negotiations we established, effective January 12, 1937, a less carload rate of 220 cents from Tampa to Chicago, this rate becoming 242 cents per 100 pounds on March 28, 1938, with the increases under Ex Parte 123. It was understood at the time that the rate of 242 cents would meet the truck competition.

For about five months after that rate was established there was a decided pick-up in the rail movement to Chicago, although even then more than 80 per cent continued to move by truck, and, afterwards, the rail movement fell off to practically nothing. I show here the figures we obtained [fol. 4741] as to total rail movement and total truck movement from Tampa to Chicago for various periods:

April, 1935, through July, 1935, rail, 3,627 pounds; truck, 257,500 pounds.

August, 1936, through December, 1937, rail, 6,654 pounds; truck, 366,200 pounds.

January, 1937, through May, 1937, rail, 49,968 pounds; truck, 288,300 pounds.

June, 1937, through October, 1937, rail, 14,064 pounds; truck, 319,200 pounds.

November, 1937, through March, 1938, rail, 1,105 pounds; truck, 346,400 pounds.

August, 1937, through July, 1939, rail, 24,072 pounds; truck, 1,550,800 pounds.

It will be seen from the above figures that establishment of the lower rate to Chicago did not have the result which was expected in returning the traffic to rail handling. There was another unexpected result in that the rate to Chicago had been published subject to the intermediate rate rule without adequate restrictive routing, and it was found that the reduced rate to Chicago would, under the intermediate rate rule, apply to Kansas City, Missouri. The railroads did get the business to Kansas City, Missouri, until the truck lines met that rate.

Subsequently the rate to Chicago was restricted to not apply through Kansas City, and later it has been cancelled [fol. 4742] altogether, because it did not move any appreciable amount of traffic.

The Tampa railroads had several conferences with the Tampa manufacturers in an endeavor to work out rates which would bring back to the rail lines a fair share of this traffic. We are told, however, that as long as the trucks met the rail rates there was little chance of any appreciable amount of traffic moving via rail, not only to Chicago, but to other points in Central Illinois Freight Association territories due to the quicker service by trucks.

In a final effort to recapture some of this traffic, the rail lines established a carload rate of 161 cents per 100 pounds, subject to minimum weight of 30,000 pounds, effective September 30, 1939. It was thought that this carload rate coupled with the stopping in transit arrangements, would enable the rail lines to recapture some of the tonnage, but it did not work out that way, and there was no movement on that rate.

Incidentally, the truck lines met the 161 cent rate as a volume rating, but they handled no traffic thereunder. The rate of 161 cents is lower by 17 cents per 100 pounds than the Official territory level.

We have not been approached by the manufacturers or by shippers' organization at Tampa for a readjustment of the rail rates on cigars to Southern or Official territories. All the negotiations with respect to rail rates have been [fol. 4743] initiated by the railroads.

Coming to the question of rates on cigars from Jacksonville, the situation here is very much as indicated with respect to the rates from Tampa. While water service to the East was available there was no way the railroads could meet the all-water rates. The all-water rate from Jacksonville to New York, proper, was 127 cents prior to June 1, 1942, as published in Item 1180 of Agent I. H. Hasker's ICC 262. That rate was cancelled effective June 1, 1940, leaving second class rate of 130 cents to apply. The Official territory level for the rail distance is, as shown by page 19 of my exhibit, 173 cents.

To New York, Philadelphia and Baltimore, the all-water rate, prior to June 1, 1942, was 109 cents per 100 pounds, as published in Item 1180 of Agent Hasker's ICC 262, this being increased to 120 cents in Item 1080 of Agent Hasker's ICC 275, effective June 1, 1942, as shown on page 19 of my exhibit. The second class rates under the Docket 15879 scale for all-rail distances are to New York 152 cents, Philadelphia 143 cents and Baltimore 136 cents.

Proportional rates applicable on movements beyond the Eastern ports to interior Eastern and Buffalo-Pittsburgh points are published by all water, these proportional rates being 76 cents to Boston and 68 cents to New York, Philadelphia and Baltimore, per Item 1180 of Agent Hasker's ICC 262, which were increased, effective June 1, 1942, in [fol. 4744] Item 1080 of Agent Hasker's ICC 275 to be 84 cents to Boston and 75 cents to New York, Philadelphia and Baltimore. Proportional rates are also published by all water from Jacksonville to the Eastern port cities when for movement beyond to points in Central Freight Association territory or west thereof, such proportional rates being published in Item 2845 of Agent Hasker's ICC 275, and being to New York 60 cents, Philadelphia 67 cents and to Baltimore 68 cents per 100 pounds.

From Jacksonville to Central-Illinois Freight Association territories the movement has, as was the case from Tampa, been mostly by truck. In October, 1934, this situation came again to our attention and it was found that the truck lines had established to points in Central-Illinois Freight Association territories rates which were approximately the same as the combination of the proportional rates by water to Baltimore, plus the water-rail rates from Baltimore to Destination.

Based on prior experience, it was concluded that if rail carriers met such rates, the trucks would if necessary to control the handling of the traffic make further reductions, and therefore no changes *was* made in the rail rates.

I do not think it amiss to say that the principal manufacturer, almost the only one shipping cigars from Jacksonville, owns part or all of one of the truck lines operating from Jacksonville to Southern, Central Freight Association [fol. 4745] and Illinois Freight Association points, and advice we have received from our representatives on the ground has all along been that we cannot expect to obtain any appreciable movement to Central Freight Association or Illinois Freight Association territories as against the truck lines.

At page 1841 of the transcript, Witness Maurer mentions the manufacture of safety matches in cardboard strips at Jacksonville and infers that by reason of inability to obtain prompt relief in connection with its freight rates to Central territory, the plant was unable to exist and was closed.

We were approached there by the manufacturer to establish rates from Jacksonville to Chicago and Minneapolis particularly, as well as to other points in Central and Illinois Freight Association territory. We were advised that a rate of 80 cents would be necessary from Jacksonville to Chicago. A rate of 80 cents is 15 cents per 100 pounds less than the normal Official territory level of fourth class. The Official territory roads did find it necessary as a truck competitive measure to reduce the rates within that territory generally on matches, carload, to 40 per cent of first class and at that level the rate from Jacksonville to Chicago would be 76 cents.

The Southern railroads a year or so prior to this request also had occasion to consider the rates on matches, carloads, from a truck competive standpoint, and for that pur- [fol. 4746] pose had, by exception sheet rating, reduced the rating from fourth class to fifth class.

Later this exception sheet rating was cancelled and the classification itself changed to fifth class. I have previously explained that where truck competitive rates are found necessary in one territory, but not between that territory and another, it has not been the custom, nor has it been required by the Commission, to make similar reduction in the interterritorial rates.

Mr. Gwathmey: The witness is offered for cross-examination.

By Commr. Splawn:

Q. Before cross-examination, may I ask a question? What percentage of the rail traffic originating in Florida and destined to Florida then do you estimate is tied to the rails; not competitive with trucks and water?

A. Mr. Commissioner, there is none of it that is tied to the rails. We find that we sometimes are unable to make rates low to get logs, even. That is probably the lowest rated commodity you can find to move by rail. There is none of it that is tied to rail.

Now, wait a minute. I will take that back. Phosphate rock and sand and gravel, for all except short distances, probably move by rail. Phosphate rock and sand do not move much by truck.

Q. What is your theory about the differential down there? [fol. 4747] A. In those instances where we are able to retain the differential, we should be permitted to do so. If the ten years from 1930 to 1940 can be considered as anything like normal, we need every penny that we can get to keep a jump ahead of the sheriff; in fact, we incurred a deficit in those ten years. In those instances where we have found that it would get more business to the carrier, to the railroad, to waive the Florida arbitrary, we have usually done so.

Commr. Splawn: Thank you.

Cross-examination.

By Mr. Norman:

Q. I just have one or two questions about this comment on Mr. Cates' testimony. Did you understand Mr. Cates to say that his competition was with the pickle plants in C. F. A. territory and not Trunk Line territory?

A. Yes, sir.

Q. Then, why have you prepared the rates with Trunk Line territory instead of the rates that he really has to compete with?

A. For the reason he is located well east of the Buffalo-Pittsburgh territory, and the Official territory level, as I understand it, would be between two points in Official territory. Now, you can take different points in C. F. A. or you can take from Trunk Line to C. F. A., but you will still be within Official territory. The C. F. A. level is the truck competitive level.

[fol. 4748] Q. He has truck competitive rates now, too, doesn't he?

A. To South Florida, yes.

Q. Yes, to nearby points. And one of the fears he considered was that they might be taken away from him, and then he would not have any.

A. That is right.

Mr. Norman: That is all.

Commr. Aitchison: Anything further? You are excused.

(Witness excused.)

W. W. Wolford sworn and testified as follows:

Direct examination.

By Mr. Gwathmey:

Q. State your full name and address.

A. W. W. Wolford, address, Room 352, Seaboard Railway Building, Norfolk, Virginia.

Q. And your occupation, please?

A. I am assistant freight traffic manager for the Seaboard Railway.

Q. State briefly your traffic experience.

A. My traffic experience covers a period of more than 20 years, practically all in the traffic departments of railroads in Southern territory; the last 10 years as an official, the first ten years in various clerical capacities.

Q. Are you testifying solely on behalf of the Seaboard Air Line in this case?

[fol. 4749] A. No. My testimony is in behalf of Southern territory lines as a whole, although some of it will be supported by facts and figures of the Seaboard Railway alone.

Q. Have you two exhibits and a prepared statement, both of which have been distributed?

A. I have, yes, sir.

Mr. Gwathmey: Mr. Chairman, the original exhibit was distributed at Columbus, and we have added one page since, which is intended to answer a question which your Honor asked several witnesses in Columbus. I think we should ask that the separate page be given one exhibit number.

Commr. Aitchison: Which one do you want marked 203?

Mr. Gwathmey: The single page headed, "Seaboard Railway—Southern Region—Class I Railroads," and the exhibit headed at the top "Index of Contents" to then be marked Exhibit No. 204.

Commr. Aitchison: The exhibits will be so identified.

(Exhibits 203 and 204, Witness Wolford, marked for identification.)

By Mr. Gwathmey:

Q. Mr. Wolford, pages 1, 2 and 3 of your prepared statement set forth your conclusions concerning the importance from a revenue standpoint of the traffic moving on class rates under classification ratings. Can you state briefly what your conclusions are as to the amount of revenue that is derived from that traffic?

[fol. 4750] A. Yes. My Exhibit No. 203, in the upper left quarter, shows the total amount of revenue annually derived from carload traffic; also from less carload traffic, and the percentage relationship of the less carload revenue to the total carload and less carload revenue.

My information is that approximately 25 per cent of the less carload revenue comes from traffic moving on class rates and under classification ratings.

Commr. Aitchison: Do you include the column rates?

The Witness: Yes, sir.

Mr. Gwathmey: No.

The Witness: Not column rates; that is in the classification proper.

Commr. Aitchison: Not exceptions to the classification?

The Witness: Many of the columns are in both the classifications and the exceptions. Column 100, for example, is in both. If you go to the classification for the rating that you apply on the traffic, then it is moving under the classification, but if you go to the exceptions, and if you find that it takes first class in the exceptions, why then it is moving under the exceptions and not under the classification.

Commr. Aitchison: Well, I am just trying to find out what you have included here, and I don't know now from your answer.

The Witness: I have everything, every column that is in [fol. 4751] the classification, if you go then to the classification for the rating.

Now, the columns that are in the classification are Classes 1 to 12, and the multiples of the first class, and three or four odd columns, such as 50 per cent, and I believe 57½ and 47½ on certain individual commodities. They are named in the classification.

The columns that I speak of are specifically named in the classification as being class rate columns.

Commr. Aitchison: Now, suppose you find in a tariff a provision that a given article should take, we will say, 50 per cent of first class; would you call that a class rate or not?

The Witness: No, you have to go to the classification to find that it does take 50 per cent. You do not find that in the class tariffs. You cannot apply a class rate on an article until you go to the classification and find it in there.

Commr. Aitchison: You mean that your tariffs on the Seaboard are so constructed that you do not have any rates published in the way I have indicated, independent of your class scale, but a provision that a given commodity shall take 50 per cent first class or some other per cent?

The Witness: Many tariffs, including Seaboard tariffs, carry in them what are termed exceptions to the classification. Is that what you are thinking of?

[fol. 4752] Commr. Aitchison: Yes.

The Witness: Well, those I do not term class rates moving from under classification ratings: They are class rates moving on exception ratings.

Commr. Aitchison: Well, are they in or out of this statement here?

The Witness: They are out.

Commr. Aitchison: Although the exception might be that fourth class should be applied instead of third, still you left it out?

The Witness: Yes, sir; because then it is not moving under the classification.

Commr. Aitchison: I just wanted to make sure what you had in mind. We changed the first class rate, however, and we changed that rate, don't we?

The Witness: No, sir. If you make a new class rate subject to the classification, you will not change that particular rate. It will still be applicable against the old class rates.

By Mr. Gwathmey:

Q. Mr. Wolford, having in mind the question which the Commissioner asked several witnesses at Columbus, have you undertaken to make an estimate here of the amount of revenues which the Seaboard derives from traffic which moves under class rates?

A. I have made an estimate here, although I have not [fol. 4753] made any study on which the estimate is based.

Q. What is that estimate?

A. I have estimated that 25 per cent of the Seaboard Railway's less carload revenue would move or would be derived from traffic moving on class rates under classification ratings, and it is my estimate that a similar amount of revenue would be derived from carload traffic moving on clas rates under classification ratings.

Commr. Aitchison: 20 or 25 per cent?

The Witness: Not of carload revenues; a similar amount of revenue from carload traffic.

Commr. Aitchison: Well, what is the difference between carload revenue and revenue from carload traffic?

The Witness: There is considerable difference.

Commr. Aitchison: What is it?

The Witness: Well, let me clear up my answer, and then you perhaps won't want an answer to that. I estimate that

25 per cent of the less carload traffic is derived from traffic moving on class rates and classification ratings.

Now, applying that 25 per cent to the Seaboard's less carload traffic on the exhibit there for the year 1941, of $5,269,000, 25 per cent of that would be roughly $1,250,000. Now, I say another million and a quarter dollars would be derived out of the carload traffic of $45,000,000; in other words, an equal amount of carload traffic would be about [fol. 4754] what would move on class rates under classification ratings.

Commr. Aitchison: Something like 2 or 3 per cent?

The Witness: Yes, somewhere between 2 and 3 per cent. The total figure for both carload and less carload would be about two and a half million for the Seaboard alone.

Mr. Norman: May I ask a question about this column rate percentage? I don't know whether I understand that witness.

If a rate is published, we will say, 30 per cent of first class, and the first class rate is changed, what happens to that rate that is published at 30 per cent of first class?

The Witness: I will have to explain to you the mechanics of the tariff to answer that. Tariffs on their face refer to someplace where you will find the articles that taken 30 per cent of first class. The 30 per cent alone does not do you any good, as far as checking the rate is concerned. You will have to find the classification that will tell you where to use 30 per cent on a given article.

If you find from that classification that the article takes 30 per cent, then it is moving on a class rate, under classification rating. If the front of the tariff makes it subject to exceptions to the classification, and you go to the exceptions, and it tells you to use 30 per cent, then you are not using the classification rating, but you are using the exceptions.

Mr. Norman: Well, waiving whether you are using the [fol. 4755] classification or exceptions, what is going to be the effect of that rate, of changing the first class rate?

Chmn. Alldredge: They could continue the old class rates, for that purpose.

Commr. Aitchison: That is what was done with fruits and vegetables in New York, in some of these cases.

The Witness: It was done in the Consolidated Southwestern Case too.

Commr. Aitchison: They carried the old class rates and the column rating applicable. However, Mr. Wolford wants the tariffs published in this way, that on a particular item, which the tariff maker wanted to deal with, he could provide that the article should take 30 per cent of the class rate shown on Agent so and so's tariff, No. such and such, properly designated, and the re-issues thereof and supplements thereto; and then, wouldn't it change with the first class rates?

The Witness: If I understand your statement, it would, yes.

Commr. Aitchison: So that you have got to take that into account before you can tell whether the first class rate is going to change a rate on a particular commodity that happens to be out of the classification for the time being.

The Witness: Yes, sir. I am merely assuming that the Commission, in fixing these first class rates, will make them subject only to the classification. If you see fit to make [fol. 4756] that exception to the exceptions as well, why, that will multiply the amount of revenue involved many times, because there is far more revenue derived from traffic moving on exceptions than on the classification.

Chmn. Alldredge: Does that prove to your mind that the exception is giving way and the function normally performed by the classification is being performed by exceptions?

The Witness: That is the situation at the moment. I don't know that you could say that that was a permanent situation, though, but it certainly is now.

By Mr. Gwathmey:

Q. There were many commodities, Mr. Wolford, put over under the exception ratings which had formerly taken the class rate proper.

A. Yes, sir.

Q. As the result of the percentage changes, and the increases that were authorized in some of the general revenue cases.

A. Yes. That was the result in a lot of applications under Ex Parte 123; a lot of the traffic that had theretofore moved on the classification ratings was given the separate ratings.

Q. Pages, 4, 5, 6 and 7 of your prepared statement seem to set forth the extent to which conditions have changed

Since the present level was prescribed, and became effective in 1928 within, from and to Southern territory.

Can you summarize very briefly these changed conditions?

Commr. Aitchison: Why, if he is going to put the whole [fol. 4757] statement in.

Mr. Gwathmey: Well, I am perfectly willing to put it all in, if you will let me read it, but I just want to make something explanatory of the system, and I am merely trying to point out the conclusions that we are trying to establish.

Commr. Aitchison: Off the record.

(Discussion off the record.)

Mr. Gwathmey: With your Honor's permission I will go ahead, and if I seem to transcend too far, I will adopt some other method. I have only about three or four questions to ask Mr. Wolford.

Commr. Aitchison: All right.

By Mr. Gwathmey:

Q. Go ahead, Mr. Wolford.

A. Yes. The rate level has become lower through reductions made to meet competitive conditions; costs as refeleted in wage scales, prices of materials and other cost factors have increased; and as to less carload traffic the service rendered has also increased through the inauguration of pick-up and delivery service, which costs the railroads about 7 per cent of all less carload revenue collected. The figures covering pick-up and delivery costs are shown on the lower half of my Exhibit 203.

Q. At pages 6 and 7 of your written testimony and on your Exhibit No. 203, have you reproduced figures showing how the Seaboard Railway has fared under the present class [fol. 4758] rate structure?

A. The Seaboard Railway went into receivership in December, 1930, and since that time, through 1941, has accumulated deficits totaling $66,475,190.

Commr. Aitchison: Now, that is net income, isn't it?

The Witness: Yes, sir.

Commr. Aitchison: That net income was derived by retention of the accrued interest, although not paid, among other things.

The Witness: That is right, sir.

Commr. Aitchison: Do you ever expect to pay it?

The Witness: I don't know about that.

By Mr. Gwathmey:

Q. Pages 9 to 15, inclusive, of your written testimony covers rebuttal of sheets M-2 to M-33 of Witness Maurer's Exhibit 92.

Can you briefly state the substance of your rebuttal?

Q. Yes. These pages of Witness Maurer's exhibit primarily showed that the class rate structure within southern territory reflected the Docket 13494 Appendix K-2 scale, except that to and from Florida peninsula certain arbitraries are added.

Pages 9 to 15 of my written test-mony and pages 2, 3, 4, 5, 6 and 6-A of my Exhibit No. 204 have for their purpose showing that even with these Florida peninsula arbitraries added to the basic scale, the resulting progression of the scale produces rates not too high for the additional mileage [fol. 4759] and service in relation to the progression of the scale up to the point where the arbitraries begin to be added.

In other words, the progression of the Appendix K-2 scale for the longer hauls is retarded more than is justified by the additional transportation service involved in the additional mileage, and the addition of the peninsula arbitraries into the scale for the added distance into the peninsula produces a rate of progression and rates for the added haul into the peninsula that are not too high in comparison with the charges under the scale up to the point where the peninsula arbitraries begin to be added.

Q. Pages 16, 17 and 18 of your written testimony, and page 7 of your Exhibit No. 203 cover rebuttal of pages M-57 to M-71 of Witness Maurer's Exhibit No. 92?

A. Yes. Pages M-57 to M-71 of Witness Maurer's exhibit compares the class rate level between Official territory and Florida points with the class rate level in Official territory for the same distance. The comparison is made by totaling the rates of the first six classes. It is, therefore, a comparison of first class with first class, second class with second class, and so on, class for class through sixth class.

Page 7 of my exhibit shows that the classification ratings in Official and Southern classifications are predominantly matched on equal percentage columns, and not class for class. Witness Maurer's exhibit ignores this fact and [fol. 4760] therefore presents an erroneous and exaggerated picture of the amount by which the rate level to Florida exceeds the rate level within Official territory.

Q. Have you further in your testimony undertaken to rebut certain testimony given by Witness Morrell of the Manufacturers Record?

A. Yes, sir.

Q. And also testimony given by Mr. Conville, a shipper who, as I recall, manufactured washboards?

A. Yes, sir.

Mr. Gwathmey: Mr. Commissioner, if it is agreeable, I would just ask to have the statement copied into the record without reading it. I have tried to explain what it shows.

Commr. Aitchison: That may be copied.

Mr. Gwathmey: And I offer the two exhibits.

Commr. Aitchison: Without objection, Exhibits 203 and 204 are received.

(Exhibits 203 and 204, Witness Wolford, received in evidence.)

(The statement is as follows:)

Q. (By Mr. Gwathmey). State your name, address and occupation.

A. W. W. Wolford, Room 352 Seaboard Railway Building, Norfolk, Virginia.

I am assistant freight traffic manager of the Seaboard Air Line Railway, and have held that position for more [fol. 4761] than four years.

Q. Briefly state your traffic experience.

A. My traffic experience covers a period of more than twenty years, practically all in the traffic departments of railroads in Southern Territory, the last ten years as an official, the first ten years in various clerical capacities.

Q. Are you testifying solely on behalf of the Seaboard Air Line Railway?

A. No, my testimony is in behalf of Southern Territory lines as a whole, although some of it will be supported by facts and figures of the Seaboard Railway alone.

Q. Can you give any information concerning the importance to the Seaboard Railway of the revenue derived from traffic moving on class rates under classification ratings?

A. Not accurately. My answer will necessarily to an extent be a judgment figure. No records are kept in the normal course of business from which the answer can be determined.

However, a great majority of less carload traffic moves on class rates, and a relatively small per cent of carload traffic, and the railroads do keep a record of less carload tonnage and revenues separate from carload tonnage and revenues. These less carload figures are reported to the Interstate Commerce Commission, and are published in their Freight Commodity Statistics, Class I Rail Carriers, Statement 42100 Series. These figures for the Seaboard Railway and for the Southern region are reproduced in [fol. 4762] my exhibit.

It will be seen that the Seaboard's revenue from less carload traffic has varied from 10.4 per cent to 15.1 per cent of total revenue from both carload and less carload freight during this eleven year period. The percentage for the Southern region ranged from 9.2 per cent to 14 per cent.

However, all less carload freight does not move on class rates, and all that moves on class rates does not move under classification ratings. Most of it moves under ratings in Exceptions to the Classification.

It is my belief that approximately 25 per cent of less carload revenue is derived from less carload traffic moving on class rates and under classification ratings. Applying this figure to the Seaboard's 1941 lcl traffic, it will be seen that in money it amounts to more than one and one-quarter million dollars annually for the Seaboard Railway alone, and on its less carload traffic alone. When carload traffic is included, it is my opinion that this figure would be roughly doubled, and would be two and one-half million dollars. The following commodities are mentioned as examples of carload traffic moving on class rates under classification ratings;

Machinery, especially cotton mill machinery, taking sixth class.

Agricultural implements, taking sixth class.

Bicycles, taking third class.

Radio receiving sets, taking third class.

[fol. 4763] Matches, taking fifth class.

As I have stated above, all traffic moving on class rates does not move on ratings in the classification proper, but much of it moves on class ratings in Exceptions to the Classification. A reduction in class rates, even though the new class rates were made subject only to the classification would create demands for reduced rates on much traffic theretofore moving on Exceptions ratings, to the extent that the new rate subject to the classification proper rating made lower charges than the old rates subject to Exceptions ratings.

When less carload traffic moving on class rates under ratings in Exceptions to the Classification is included, it will, in my opinion, involve an additional 50 per cent of less carload revenue, or a total of 75 per cent moving on class rates, under ratings on both the Classification and Exceptions.

This 75 per cent applied to the Seaboard Railway's 1941 lcl revenue would be equivalent to approximately three and three-quarters million dollars. Of course, the carload traffic moving on class rates under ratings in Exceptions to the Classification would involve revenues many times greater than that involved on less carload traffic.

On that particular point, Witness B. F. Morris' exhibit at the Columbus hearing made an analysis on sheets 1 to 34, inclusive, of the effect of the application of the rate level prescribed in the Eastern Class Rate Case upon [fol. 4764] commodities now moving under Exceptions ratings or so-called "Column rates" within, from and to Southern territory. That test showed that the Official territory class rate level, if applied within, from and to Southern territory, and made subject only to the ratings in the Official classification proper, would reduce 71 per cent of the rates now applicable under existing Exceptions ratings.

That test further showed the Official territory class rate level, if applied within, from and to Southern territory, and made subject to the Official Classification and Exceptions, would reduce 93 per cent of the rates now applicable under existing Exceptions ratings.

Answering your question more specifically, if the Commission should prescribe a lower level of class rates within, from and to Southern territory, and should make such class rates subject only to the Classification proper and not to Exceptions ratings, it would affect traffic producing an annual revenue of about two and one-half million dollars for the Seaboard Railway alone.

Q. What have you to say regarding any changes in conditions that may have occurred, as affecting the justification for the present class rate level and revenues, or a reduced class rate level and revenues?

A. In answering that question, I wish to divide the time period into two parts and discuss each separately. The [fol. 4765] first period will be from the time the present class rate structure was prescribed and became effective in 1928, and to and including the Ex Parte 148 increase effective March 18, 1942. The second period will be after Ex Parte 148.

The present class rate level within Southern territory and between Official Territory and Southern territory was prescribed by the Commission in the Southern Class Rate Investigation, Docket 13494, and became effective January 15, 1928. Most of the traffic covered by the Manufactures and Miscellaneous group of the Commission's Freight Commodity Statistics also moves on percentage columns of the first class rate there prescribed.

Between the South and the Southwest the class and commodity rate structure was prescribed in the Consolidated Southwestern Cases, and became effective July 14, 1928.

Since that time and up to the time the effect of the war was felt on traffic, there has been a constant whittling away of the rate level through reductions made in order to meet competitive conditions, and, at the same time, since the depression years, a constant increase in costs of the transportation service.

Specific evidence of the extent to which the rate levels on individual traffic have been reduced is already of record in an exhibit filed at the Indianapolis hearing by Witness Morriss. It is further shown by the gradual recession in [fol. 4766] the ton-mile revenue since this prescribed rate level became effective.

The ton mile revenue for Class I Carriers, Southern Region, for the year 1929 was 10.88 mills for an average haul of 195 miles. It continued at this level through 1932, when it was 10.89 mills for an average haul of 202 miles.

From that point it has gradually receded, except for a temporary increase in 1938, the year Ex Parte 123 became effective, and 1939. By 1941 it had dropped to 9.46 mills for an average haul of 201 miles. This ton mile decrease would be much more pronounced if it could be obtained separately for traffic that generally moves on class rates and percentage column rates, which is the traffic that has felt the competition from other forms of transportation most, and has received the greatest reductions.

Other traffic not moving on rates related to the class rate structure, such as coal, lumber and cement, representing a substantial part of the total traffic, has received either no reduction or only slight reductions, which prevents this recession in the ton mile revenue figure from disclosing the full extent of the recession in the class rate structure, and in the commodity rate structure that is related to the class rate structure through being a percentage column of first class.

Two general increases have been granted and are in [fol. 4767] effect, the Ex Parte 123 increase of 10 per cent in 1938, and the Ex Parte 148 increase of 6 per cent on some traffic and 3 per cent on other traffic, made effective in March, 1942, but subject to an expiration date. Both were designed to, or at least did not more than offset in some degree specific new burdens of cost added upon the railroads and did not have the effect of improving the already inadequate rate level before those new burdens developed.

The specific new burdens I refer to in connection with the Ex Parte 123 increase were the imposition of Social Security and Railroad Retirement taxes, wage increases, and the then recently increased costs of materials. The Commission in its decision in Ex Parte 123, 226 ICC 41, at page 136, said:

> "The present revenues of the applicants are inadequate."

Also, "The record shows that the existing basis of rates is not sufficient to maintain in full vigor either rail or water transportation.

The Ex Parte 148 increase also did no more than partially offset additional specific new burdens of cost and did not contribute anything toward relieving the already existing inadequacy of the rate level, before these new cost burdens developed. The new increased cost burdens are set forth in the report, and are increased wages, increased prices of materials and supplies, and certain other increased cost factors.

[fol. 4768] The Commission granted an increase of 6 per cent on some traffic and 3 per cent on other traffic, but limited it to expire six months after the termination of the war.

There is also one other changed condition of importance occurring during this period that has a bearing upon the continued reasonableness of the present class rate structure. That factor is the inauguration of pick-up and delivery service, and allowance. It was inaugurated in 1936. My exhibit shows the amount of that expense to the Seaboard Railway each year since its inauguration, and the percentage relationship of that expense to the total less carload revenue. It has ranged from 6.1 per cent to 7.5 per cent. It averages more than 7 per cent. I have no reason to doubt that these percentage figures for Seaboard are representative of all the Class I Carriers in the Southern Region. From both the railroads' and the shippers' standpoint, it was the equivalent of a reduction of 7 per cent in the less carload rate level.

To summarize my answer to your question covering this period, the changes in conditions that have occurred are that the service performed has increased through the inauguration of pick-up and delivery service; the rate level has declined below the level originally fixed by the Commission as reasonable and cost factors, such as wages, taxes and prices of materials and supplies have increased.

Q. How has the Seaboard Railway individually fared [fol. 4769] since the rate structure became effective in 1928?

A. The Seaboard went into receivership on December 31, 1930, as shown on the right side of my Exhibit 204, page — has had a deficit from operations each year since 1931 through 1940, inclusive. The total deficit for the eleven year period 1931 through 1941 was $66,475,190. This deficit is almost 40 per cent greater than the total revenue derived from less carload freight during that period.

Q. How much higher would the rate level have had to be in order to wipe out this deficit?

A. The total freight revenue of the Seaboard during that eleven year period was $361,519,656. The deficit was $66,475,190. So the total freight revenue needed was the sum of those two figures, or $427,994,846. This latter figure is 118 per cent of the actual freight revenue, so it would have required a rate level averaging 18 per cent higher than was in effect to wipe out this deficit during this period.

Q. Now, returning to my question regarding any changes in conditions that have occurred since the present class rate levels were originally prescribed by the Commission. In your answer you dealt with changes up through Ex Parte 148. What changes in conditions have occurred since that time?

A. The volume of traffic carried and freight revenue has increased substantially, so that even though cost of operation has also increased substantially, the net showing has improved.

[fol. 4770] The Seaboard for 1942 had a net income carried to profit and loss amounting to $2,819,263, as compared with $1,181,070 in 1941. The total for those two years is $4,000,333. This must be contrasted with the deficit for the prior ten years of $67,656,260. This favorable showing for these two years does not loom very large in comparison with the very poor showing of the prior years.

The question also arises how long this increased volume of traffic will last. The increased volume of traffic is a direct result of the nation's war effort, and it cannot be expected to last any longer than the duration of the war.

The year 1939 is in my opinion about as typical as any year that could be selected, of normal conditions before the effect of the war traffic was felt. It may therefore be treated as substantially typical of the traffic conditions that will return when the war traffic has disappeared and normal competitive conditions return.

In that year the Seaboard had operating revenues from freight of $34,630,738, and expenses of $25,183,628, producing a freight operating ratio of 72.72. Its deficit that year was $5,556,555. However, while the volume of traffic and revenue may be expected back to about the 1939 level of $34,630,738, it is certain that the expense of operations will not drop back to that level. The 1941 wage award adjusted to 1939 payrolls charged to operating expenses, freight [fol. 4771] proportion, I estimate amounts to roughly about two and a half million dollars. Taxes likewise have increased and there is little prospect of that cost element dropping back.

After giving the present favorable revenue showing of the railroads full recognition, I can arrive at no other conclusion that I consider sound, reasonable and justified, than that this favorable showing is the result of war traffic; that traffic and revenues will after the war revert to pre-war levels, but expenses will not, and that the present rate level will be more inadequate than it was before the war.

Q. Now, have you some testimony directed to rebuttal of certain prior witnesses?

A. Yes, the testimony that follows will be primarily directed to rebuttal of evidence of Witness Maurer as contained in his Exhibit 92, Witness Morrell, and Witness Fonville, but it is also intended as rebuttal of other witnesses whose testimony was similar to that of either of these three.

Q. Please proceed.

A. Witness Maurer on sheets M-2 and M-3 of his *Exhibit 92* showed the distances between nine Florida peninsula points on the one hand, and sixteen Southern territory points on the other hand. On subsequent sheets Nos. M-7 to M-33 these distances were used in making a comparison of the level of the class rates actually applicable, which rates of course included the peninsula arbitrary, with the class [fol. 4772] rates under the Appendix K-2 Scale plus the Ex Parte 123 ten per cent increase applicable in the remainder of Southern territory.

Stated in another way, these pages of his exhibit purported to show how much higher the Florida peninsula arbitraries made the rates than the K-2 scale level of rates applicable in the remainder of Southern territory. The percentage of excess varied from a minimum of 4.5 per cent at Gainesville, Florida, a point near the northern border of the peninsula arbitrary territory, to a maximum of 12.6 per cent at Miami, a point deep in the arbitrary territory.

Of course, everyone will concede that when the peninsula arbitraries are added to the K-2 scale level of rates applicable elsewhere in Southern territory, the resulting rates are higher than the K-2 scale level, but conclusions as to how much higher will depend on the method used in making the comparison.

Concerning the method used, Witness Maurer for example on sheet M-6 shows that the rate level from Jacksonville, Florida, to Cincinnati, Ohio, contains no excess over the Appendix K-2 level; but on page M-33 shows that Miami to Cincinnati the rates contain an excess of 8.9 per cent over the Appendix K-2 level meaning that Miami has a handicap of 8.9 per cent in its rate level as against Jacksonville.

The distance from Miami to Cincinnati is 1156 miles, however, and from Jacksonville to Cincinnati, 806 miles. The [fol. 4773] comparison is being made in the two scales at different spots in their graduation, namely, the 806 mile spot versus the 1156 mile spot. When that difference is translated into a common basis of comparison, such as ton mile earnings, it is found that the rate from Jacksonville reflects a level that pays 56 mills per ton mile, whereas the rate from Miami reflects a level that pays 51 mills per ton mile.

Actually therefore the shipper at Miami is paying a lower mile-for-mile rate level for his transportation service to Cincinnati than the shipper from Jacksonville is paying.

The question then may occur to some whether this is not merely a technical point of difference that offsets itself when a comparison is made to a point where the relationship in the distances would be reversed, and Miami would be 806 miles and Jacksonville 1156 miles. The answer is that the relative situation never changes and never can offset this defect. Miami is always approximately that distance over Jacksonville to every part of and any destination in what I will term southern territory proper, meaning that part of Southern territory within which the Appendix K-2 scale level of rates was prescribed and applies.

Although inter-territorial hauls are not involved in this particular part of Witness Maurer's exhibit, with which I am now dealing, this would also be true of inter-territorial hauls to and from Official territory where the rates have [fol. 4774] been made with some degree of relationship to level within Southern territory itself. Furthermore, a common mileage basis of comparison cannot be created by assuming a haul of 1156 miles from Jacksonville to any destination within Southern territory proper to make it the same mileage haul as from Miami to Cincinnati, because there is no such thing as a haul of 1156 miles from Jacksonville.

I purposely selected Cincinnati to use as an illustration because it involved the longest haul of any of the 16 representative points throughout southern territory proper used by Witness Maurer, and it being on the opposite border of Southern territory from Jacksonville represented the maximum possible haul under the Appendix K-2 scale level of rates from Jacksonville.

The Southern territory, excluding the peninsula to and from which the peninsula arbitraries are added, is geographically roughly circular, the City of Atlanta no doubt not being far from the geographical center.

On page 2 of my exhibit 203 I have reproduced the origins, destinations and distances shown on Sheet M-2 of Witness Maurer's Exhibit 92. I have also added the average distances, the first class rates and ton-mile earnings, which I will mention again later.

On page 3 of my Exhibit 203 I have taken the same 16 Southern territory proper destinations used by Witness [fol. 4775] Maurer on sheet M-2 and shown the distance from each such point to the remaining 15 points.

It will be seen that from Atlanta in approximately the general center of Southern territory the maximum haul in any direction within Southern territory is to Richmond, 542 miles. Obviously shippers at Atlanta only make use of the K-2 scale for distances 5 miles to around 550 miles. I have already pointed out maximum haul from Jacksonville on the Southern border to the most distant point on the northern border, which is Cincinnati, is 806 miles, as shown in Witness Maurer's exhibit, sheet M-2.

The very longest haul to be found on page 3 of my exhibit is from New Orleans on the southwestern border to Richmond on the northeastern border, 1032 miles.

The peninsula territory from and to which the arbitraries were prescribed is geographically attached to the border of southern territory proper and consequently reflects hauls to any given point in southern territory proper, or an average to all points that are, using Miami as about the maximum example, as much as 350 miles greater than the corresponding haul within Southern territory under the Appendix K-2 scale level.

The bottom of page 2 of my exhibit shows the average haul between the nine peninsula points selected by Witness Maurer and 16 Southern territory points to be 665 miles. [fol. 4776] The bottom of page 3 shows the average haul reflected by the 16 points in Southern territory proper is 448 miles. Although the Southern territory proper points do have use of the Appendix K-2 scale without any arbitrary, their use of the scale is for shorter distances where the scale is relatively higher than it is for the longest distances involved when the haul is from the peninsula. The figures at the bottom of page 2 show that the ton mile earnings from the peninsula origins is 65.9 mills, whereas the ton mile earnings shown on page 3 for the average haul in Southern territory under the Appendix K-2 scale level without the arbitrary is 74 mills.

Inasmuch as the comparative distance hauled under a common scale level of rates is always longer when from the Peninsula to Southern territory proper than when within Southern territory proper, the real question presented is not whether Miami is paying a rate level 8.9 per cent higher than Jacksonville for 1156 miles under a scale that Jacksonville never uses for distances above 806 miles, but whether the progression of that scale, including the arbitrary beyond 806 miles is too steep for the additional distance.

To illustrate this I have prepared page 4 of my exhibit. On the left side there is shown the Appendix K-2 Southern territory scale as of today. A straight line progression in a scale would bring about the payment of the same per mile rate per unit of traffic hauled, regardless of length of haul. [fol. 4777] The extent to which a scale is modified below a straight line progression determines how fast the per mile rate of return per unit of traffic falls as distance increases. Any drop below straight line progression generally rests on the assumption that cost of service decreases approximately as fast else it would not be justified.

Page 4 shows Richmond as an origin. The destinations on the right side are along the route of the Seaboard Railway into Miami, each destination being spaced exactly opposite its mileage block in the scale on the left. The Southern scale without arbitrary applies as far as Jacksonville. South of Jacksonville, the peninsula arbitrary is contained in the actual rates shown to the specific destinations on the right side of the sheet. It will be seen that despite the addition of the arbitrary no point south of Jacksonville pays a higher rate level per ton per mile of transportation service received than does Jacksonville. On the contrary, beyond Gainesville the decline in the ton mile earnings continues. When Miami is reached we find Miami paying 55.1 mills per ton for each mile of transportation service received whereas Jacksonville is paying 63.1 mills for the same amount of transportation.

The scale on the left shows that, exclusive of any arbitrary, it declines beyond Jacksonville from 63.1 mills for 621 miles to 49.8 mills for 1000 miles which is the Miami mileage block, but considering the more favorable conditions [4778] in the Southern territory proper than in the peninsula, any recession of earnings below those earned to Jacksonville would be a concession. The more favorable transportation conditions mentioned have been placed in evidence by other witnesses and will be summarized on brief, so I do not consider it necessary to attempt to summarize them here.

Page 5 is similar to page 4, the difference being that it uses Atlanta, Georgia, as the origin. Atlanta may be considered a representative short haul origin on traffic into the peninsula whereas Richmond is a long haul one.

Page 6 is a graph illustrating the decline in the ton-mile earnings already shown on page 4 of my exhibit. It shows beginning at Savannah, using Richmond as the origin, the rate of decline in the Southern territory scale exclusive of the peninsula arbitrary. It also shows the rate of decline including the peninsula arbitrary beyond Jacksonville. Despite the inclusion of the arbitrary the scale continues to have a substantial decline. The downward trend of the line containing the arbitrary runs almost parallel to the downward trend of the scale without the arbitrary, the difference being not in the rate of decline, but in the fact that the scale with the arbitrary is about five mills higher in its level.

Page 6-a measures the percentage of decline in ton-mile [fol. 4779] earnings beyond Jacksonville first under the Southern Scale which includes no arbitraries, second under the Southern scale with the peninsula arbitraries included beyond Jacksonville, and third under Witness Jensen's scale. Under the Southern scale the decline is down to 81.3 per cent; under the Southern scale with the arbitrary included, the decline is down to 87.3 per cent; and under Witness Jensen's scale the decline is down to 84.8 per cent.

Pages M-57 to M-71 of Witness Maurer's Exhibit 92 undertake to demonstrate how much higher the existing published class rates are than class rates would be if made on the Official territory Docket 15879 Appendix E class rate scale level between Jacksonville, Lake Wales and Miami, Florida, on the one hand, and 16 Central territory points on the other hand.

Mr. Maurer made the comparison, class for class, first class through sixth class inclusive. I have reproduced from page M-58 of his exhibit the comparison of rates between Chicago, Illinois, and Jacksonville, Florida in order to illustrate the method of comparisons used by Mr. Maurer and show the defects of that method. This information is found on the top part of page 7 of my exhibit.

It will immediately be seen that this class for class method of comparison ignores the fact that the percentage relationship to first class is different. For example, under fourth class it has the effect of comparing 55 per cent of Southern first class with 50 per cent of Official first class. [fol. 4780] Under fifth class it compares 45 per cent of Southern first class with 35 per cent of Official first class. Under sixth class it compares 40 per cent with 27½ per cent. The particular comparison between Chicago and Jacksonville in the right hand column purports to show that the rates in effect exceed the rates produced by the Docket 15879 Appendix E scale by 48 per cent rather than the 38 per cent produced by a comparison of equal percentage columns such as is reflected by first, second and third classes.

On the lower half of the page there is shown by me an analysis of the Classification ratings to demonstrate that the Classification ratings in Official and Southern territories are predominantly matched on equal percentage columns, and not class for class. The equal percentage ratings or matched ratings are shown in the blocks. The unmatched ratings on the left of each block are ratings that are higher in Official classification than in Southern. The unmatched ratings to the right of each block are ratings that are lower in Official Classification than in Southern. They are analyzed at the bottom of the page.

Attention is first directed to the analysis of the less carload ratings. It will be seen that 91 per cent are matched ratings. The remaining 9 per cent, which are unmatched ratings, are almost wholly instances where the ratings in Official Classification are higher than in Southern. [fol. 4781] This means that when differences in classification ratings are taken into account, the Official level of class rates is not merely 38 per cent lower than the actual applicable class rates, but is some percentage slightly less than 38 per cent.

The analysis of the carload classification ratings shows 50 per cent are matched ratings. The remaining 50 per cent representing the unmatched or unequal ratings predominantly reflect a lower percentage column in Official than in Southern Classification. This would, without further examination, seem to indicate that as then to carload traffic the Official level of rates would be lower than the applicable rates between Chicago and Jacksonville by a percentage slightly higher than the 38 per cent produced by the relationship of equal percentage columns.

The carload ratings in the Southern classification proper on these high classes 1 to 6 mean very little, because not much traffic would move on them. Any traffic from Chicago to Jacksonville for example rated sixth class or higher in the Classification proper would generally move on either a lower exception to the Classification or a commodity rate. As a matter of fact, there are all-freight rates generally applicable from Central territory to Southern territory that are 40 per cent of first class and subject to a few exceptions, 40 per cent would consequently be the ceiling for carload traffic from Central territory to Jacksonville.

[fol. 4782] Of course, the relationship of the two rate levels will depend upon the kind of traffic actually moving. Page 9 of my exhibit analyzes the actual less carload traffic moving on September 1, 1942, to and from Orlando, Florida. The revenue under the Official territory level is 28.3 per cent lower than the actual revenue, or, stated the other way, the actual revenue is 39.4 per cent higher than the revenue that would be produced by the Official level.

In this particular comparison the applicable rating on which the traffic did move to or from Orlando, or would move under the Official level of rates was used, and not merely the Classification proper rating. In other words, this comparison of the difference in rate levels takes into account differences in both the Classification proper and the exceptions to the Classification and does not reflect merely the difference in the Classification proper ratings.

This page shows that even to a Florida peninsula point when the rate includes the peninsula arbitrary the applicable level is only around 39 per cent higher than the Official level. The prior page shows that to Jacksonville, a point not having the Peninsula arbitrary in its rates, the percentage on a straight first class or equal percentage column comparison is 38 per cent, but taking into account differences in classification, it is convincing that the percentage is lower, but how much lower cannot be accurately deter-[fol. 4783] mined without applying the ratings to actual moving traffic.

Q. Were you present at the Indianapolis hearing, and did you hear the testimony of Mr. Eric Morrell, Editor of the Manufacturers Record?

A. Yes, I was present and heard his testimony.

Q. Then you will recall his testimony to the effect that there was a lack of manufacturing plants of substantial size in the South which he ascribed in part to the Southern freight rate structure, and that he and his publication had been active in endeavoring to locate such industries in the South?

A. Yes.

Q. Does the Seaboard Railway as a part of its traffic department have what is known as an industrial department?

A. Yes, the Seaboard Railway has an industrial department with a staff of five officers who devote ~~their~~ principal time and efforts to the location of industries on the Seaboard. They are constantly engaged in a cooperative effort with industries that are looking for a suitable location.

Q. Then would you say that the Seaboard Railway through its industrial department would or would not likely have knowledge of prospective industries which have been in the past or are now interested in a location in the South?

A. Our railroad through its industrial department would generally have knowledge of any such potential industry. [fol. 4784] Having that knowledge it would be active in developing from the promoters of such industry any obstacle to the location of that industry in the territory served by the Seaboard and would cooperate in efforts to bring about the removal of any such obstacles.

Q. Would the removal of obstacles to which you refer include removal of freight rate obstacles?

A. It certainly would, if the particular rate obstacle was a real or genuine one. Some might and occasionally do look upon any freight rate, however small and however favorably it may compare with the level generally available to his competitors, as an obstacle and seek reductions. Occasionally others look upon any rate in excess of the lowest rate to be found elsewhere on that commodity as an obstacle to be removed. My reference wasn't to those kinds of obstacles. When I said we will cooperate in removing freight rate obstacle, speaking in general terms, I mean this:

In Southern territory we have a certain level of rates on any given traffic already available to shippers of that commodity. When a new manufacturer of that commodity comes into existence, he is, under any circumstances, entitled to the benefit of that level, and it will be given to him. If this manufacturer, new or old, is trying to sell within Official territory against competitors in that territory who have the benefit of a lower rate level, we always have [fol. 4785] and will continue to make every effort to make available to our shipper a rate level into Official territory competitive with that in Official territory. Some rather large industries have grown up in the South under that plan, and it does seem to be a plan that eliminates freight rate differences as an obstacle to the location of industries in the South.

Q. How many times in the years 1939 to 1941, inclusive, has Mr. Morrell, or his concern, the Manufacturers Record, of Baltimore, Maryland, contacted your industrial department presenting to it a manufacturer who had under consideration the locating of a plant in the South?

A. None.

Q. Has Mr. Morrell, or the Manufacturers Record, taken up with your company the desirability of some adjustment of freight rates to meet the needs of some prospective new manufacturer for the South?

A. No.

Q. How many new industries located on your railroad during the years 1939 to 1941, inclusive, and how many of them manufacture finished products?

A. Sixty-seven new industries located on the Seaboard Railway during that period. These included industries manufacturing finished products from the forests, such as sawmills, planing mills, building supplies, crate mills, barrel stave mills and furniture plants. Also tar products, charcoal, pine oil and sulphite pulp, all derivatives of the forest. [fol. 4786] These sixty-seven also include manufacturers of finished products from agriculture, such as canners of vegetables, canners of citrus fruit, canners of condensed milk, a manufacturer of cheese and a meat packer. These sixty-seven include manufacturers of finished products such as chemicals, industrial gases, sulphate of alumina and explosives.

Q. How many of these sixty-seven are manufacturers of unfinished products?

A. Only one. This is a manufacturer of steel alloys.

Q. What proportion of the sixty-seven would you say are shipping some part of their product into Official territory?

A. I have not made a study of the traffic of these specific plants to develop where each is shipping, but I am generally familiar with the extent to which traffic of this same kind from already existing plants in the South is moving into Official territory. Based on that familiarity I would say that about forty are shipping into Official territory. The remainder are probably distributing only locally within Southern territory.

Q. Have you anything to say regarding Witness Fonville's Exhibit 79?

A. Yes. Mr. Fonville, president and manager of the Carolina Washboard Company of Raleigh, North Carolina, filed Exhibit 79 showing shipments of washboards made from Raleigh to all destinations during September, 1941.

[fol. 4787] The exhibit showed the charges applicable on the shipments and the charges that would be produced by the Official territory level. Forty-two less carload shipments moved to Official territory on which the exhibit showed that the total freight charges would be reduced from $184.06 to $168.92 or a difference of $15.14. Inasmuch as the applicable classification rating is third class under both Classifications, the difference is entirely in the rate level. It will be observed that the difference in the rate level is only 8 per cent.

In addition to the 42 less carload shipments that moved to Official territory, Exhibit 79 showed that 25 shipments moved from Raleigh to destinations in Southern territory. The freight charges collected under the Southern territory level were $158.69. The official level of rates produced $112.92, a reduction of $45.77.

Mr. Fonville named the Columbus Washboard Company, of Columbus, Ohio, as one of his chief competitors. On my Exhibit No. 203, which is a one-page exhibit, I have rerated these same shipments from Columbus, Ohio, and find that the Official territory level applied from Columbus, Ohio, to these Southern territory destinations reduces the freight charges from Columbus in the amount of $49.27, or $3.50 more than the reduction would be from Raleigh to these same destinations.

[fol. 4788] Taking all shipments to both Official and Southern territories the reduction for Raleigh would be $11.64 in excess of the reduction from Columbus, Ohio. The total weight involved is 30,089 pounds or about 3½ cents per hundred-weight. The exhibit did not show that Raleigh shipped washboards into Columbus, Ohio, itself, during September, 1941, but it did show it shipped washboards to points beyond Columbus, such as Chicago, Detroit and Toledo. The present rate from Raleigh to Toledo is 117 cents. The present rate from Columbus, Ohio, to Toledo, is 43 cents. The shipper at Raleigh is therefore not presently kept out of this market adjacent to Columbus by a rate difference of 74 cents per hundred pounts, only 11 cents of which is due to difference in the rate levels, the remaining 63 cents being due to the geographical disadvantage of Raleigh as compared with Columbus, as reflected in the difference in distance.

Exhibit 79 showed that there were no carload shipments from Raleigh during the one month test period of September, 1941, used by the witness as being a representative period. The only reference the witness made to the lack of carload traffic was the statement that:

> "My distribution is limited only to the extent of the over-all or average freight rate advantage of my competitors, which advantage, aside from the less carload rates, is accentuated by their ability to ship a part of their pro- [fol. 4789] duction in carloads."

There was no explanation given why Raleigh cannot ship in carloads. On the contrary the witness' exhibit 79 showed that on carloads the Southern Classification rating is 7th class or 35 per cent of first class, whereas in Official Classification the carload rating is 37½ per cent of first class. This means that the competitor in Official territory is at a disadvantage of 7.1 per cent in classification rating, which almost exactly offsets the advantage of 8 per cent he enjoys over Raleigh in the rate levels themselves exclusive of the Classification differences.

Commr. Aitchison: Cross examine.

Cross-examination.

By Mr. Norman:

Q. I would like to ask just a few more questions about this column business. Where rates are made the same percentage of first class, column percentage, in the various territories and interterritorially, the rates from the South to Official territory would reflect the 38 per cent that the first class rate is higher than the Official territory rate, wouldn't it?

A. Yes, sir.

Q. Now, if you change that first class rate, made it a parity with the Official territory rate, under your theory that rate that was made the percentage of the first class would continue to reflect the 38 per cent difference, would it not?

[fol. 4790] A. You will have to read that.

(Question read by reporter.)

A. No. If you change your first class rate to be the same in Southern territory as in Official, there would not be 38 per cent difference in the class rate any more; they would be equal.

Q. But you say that the column rate would not be related to the new first class; the rate would be related to the new first class.

A. What you are really asking is what commodities will the new first class rates apply on.

Q. I am not. I am going to ask what is going to happen to those commodities that are now published as a percentage or column of first class by exceptions.

A. They are going to stay the same unless the Commission sees fit to prescribe the classification, these exceptions to the classification, against the new class rates.

Q. In other words, the only way the Commission would reach that in this proceeding would be by putting this exception in the classification.

A. No.

Q. Is that right?

A. No. That would not be it. They would not necessarily have to do that.

Q. Well, how would they do it?

[fol. 4791] A. There are other ways they could do it.

Q. How?

A. Simply by saying in their decision that the new class rates shall be subject to the Southern classification and to exceptions to the Southern classification.

Q. The first class rate?

A. Yes. There is nothing difficult or complicated about the mechanics of how to do it, if they see fit to do it.

Q. Well, unless they took some one other of these subjects, it would not affect those rates at all, to change the first class rate, would it?

A. No.

Mr. Norman: That is all.

Commr. Aitchison: Anything further from Mr. Wolford?

Mr. Gwathmey: I understand that Mr. Wolford has two more exhibits, but he hasn't them with him this afternoon. I may call him tomorrow morning to put those exhibits in.

Commr. Aitchison: All right.

(Witness excused.)

C. C. Wimmer was sworn and testified as follows:

Direct examination.

By Mr. Gwathmey:

Q. Will you please state your name?

A. C. C. Wimmer.

Q. Mr. Wimmer, with what company are you connected [fol. 4792] and in what capacity?

A. I am connected with the Seaboard Air Line Railway. I am assistant general auditor.

Q. Assistant general auditor?

A. Yes, sir.

Q. And your office is where?

A. Portsmouth, Virginia.

Q. Have you been connected with the accounting department of the Seaboard Air Line Railway for a number of years?

A. Yes, sir. I have been connected with the accounting department for something over 20 years, and with the railroad for over 30 years.

Q. Have you prepared an exhibit from the standpoint of the Seaboard Air Line Railway dealing with statistics of operation in the Florida peninsula as compared with the rest of the system?

A. I have.

Mr. Gwathmey: May we ask that this exhibit be identified, Mr. Chairman?

Commr. Aitchison: No. 205.

(Exhibit 205, Witness Wimmer, marked for identification.)

By Mr. Gwathmey:

Q. Mr. Wimmer, will you proceed to describe this exhibit, and tell what it shows?

A. My Exhibit No. 205 consists of a title page and six [fol. 4793] pages, numbered 1 to 6. The first section of the exhibit, pages 1 to 4, inclusive, deals with statistics of freight train operations of the Seaboard Air Line, and shows the disabilities of operations on the north and south Florida operating divisions.

Pages 5 and 6 of my exhibit show property investment, cash, materials and supplies; condensed net railway operating income account and rate of return for principal Class I roads operating in the Florida peninsula; Class I roads in southern regions; and Class I roads in Eastern District, including Pocahontas region for certain years between 1923 and 1941.

Before discussing pages 1 to 4 of my exhibit, I would like to make a few observations. The Seaboard Air Line Railway is comprised of six operating divisions. Each of these divisions has its own division auditor and all disbursements arising on the divisions are audited in the accounts by the division auditors; additionally, all operating statistics pertaining to the operations of the divisions are separately compiled. Two of the Seaboard Air Line operating divisions, the North Florida and the South Florida Divisions, lie almost entirely within the State of Florida. Of the 1,609.15 miles comprising the North Florida and South Florida Divisions, only 15.66 miles are outside of the State of Florida; that mileage is a part of the line extending northward from Tallahassee, Florida, to Bainbridge, Georgia.

As heretofore stated, the Seaboard maintains operating [fol. 4794] statistics separately for each operating division and on page 1, I have compared the miles operated and the traffic density of the North and South Florida Divisions with the Seaboard System.

On pages 2 to 4, inclusive, of my exhibit, I have shown the principal statistics for freight train operations on the North and South Florida Divisions as contrasted with freight train operations on the balance of the Seaboard System. These comparisons are shown for the years 1929, 1932, 1936, 1938 to 1941, inclusive, and for the first seven months of 1942. The years I have used include the last good railroad year prior to the depression, two years during the depression period, the last four full years, and the first seven months of 942.

The comparisons shown on the exhibit are self-explanatory; however, for the purpose of illustration I will comment on some of these comparisons.

Item 1, page 1, shows that in 1929 the mileage of the North and South Florida Divisions combined was 39.27 per cent of the total system mileage operated at the close of the year. In 1941 the mileage of these two divisions was 37.36 per cent of the system mileage.

Item 2 shows that the North and South Florida Divisions contributed 23.28 per cent of the gross ton miles in freight service for the year 1929, and 23.58 per cent of the total [fol. 4795] gross ton miles in freight service for the year 1941.

Item 3 shows that in 1929 the North and South Florida Divisions contributed 24.15 per cent of the net ton miles in freight service and 23.42 per cent for the year 1941.

Item 4 shows that by using revenue ton miles in freight service, the North and South Florida Divisions for 1929 contributed 24.77 per cent of the total and for 1941, 22.36 per cent.

It seems appropriate to here point out that while the miles of road operated on the North and South Florida Divisions constitutes approximately 37 per cent of the total system miles as of December 31, 1941, the per cent of the system traffic contributed by these divisions, whether measured by gross ton miles, net ton miles, or revenue ton miles, is only approximately 23 per cent of the total traffic handled by the system.

I will now discuss item 5 on page 3 which shows that the traffic density of the North and South Florida Divisions for the year 1929, measured in gross ton miles per mile of road operated at close of year was only 46.94 per cent of the density of the balance of the system and in the year 1941, 51.75 per cent of the density of the balance of the system.

Item 6 compares the traffic density per mile of road operated at close of year on basis of revenue ton miles and shows that for the year 1929 the density on the North and [fol. 4796] South Florida Divisions was only 50.92 per cent of the balance of the system, and for the year 1941 only 48.29 per cent of the balance of the system.

Item 7, Freight Train Load Gross, shows that lighter trains on the average are run on the North and South Florida Divisions than on the remainder of the system. In 1929 the trains on the North and South Florida Divisions were only 83.87 per cent as heavy as on the balance of the system, and for the year 1941 85.97 per cent as heavy.

Item 8 of this exhibit shows the average train l-ading of revenue and non-revenue freight. In 1929 the trains on the North and South Florida Divisions were only loaded 88.08 per cent as heavy as on the balance of the system and for the year 1941 85.17 per cent as heavy.

Item 9 on page 3 shows the freight train load of revenue freight which is the pay load and is the real significant statistic for train loading. In 1929 the average revenue load on the North and South Florida Divisions was 90.96 per cent of the balance of the system; however, this per cent has decreased to 80.32 per cent in 1941.

Now, in order to show how operating costs are affected by the lowe- traffic density and lighter train loads in Florida, Item 10 compares crew waggs per 1000 net ton miles on the North and South Florida Divisions with the balance of the system. It will be noted that in 1929 the crew wages, [fol. 4797] which are wages paid to crews operating freight trains, for the North and South Florida Divisions, were 32.43 per cent more than for the balance of the system. For the year 1941 the crew wages on the North and South Florida Divisions were 29.58 per cent greater than on the balance of the system.

Item 11 shows crew wages per 1000 revenue ton miles. It will be noted that in 1929 on this basis the cost on the North and South Florida Divisions was 27.91 per cent more than for the balance of the system and in 1941 the cost was 38.27 per cent more than for the balance of the system.

Item 12 of this exhibit shows cost of fuel per 1000 net ton miles. In 1929 the cost on the North and South Florida Divisions was 94.64 per cent of the balance of the system and for the year 1941 it was 106.90 per cent of the balance of the system.

Item 13, page 4, measures fuel costs by revenue ton miles. The cost in 1929 on the North and South Florida Divisions was 92.31 per cent of the balance of the system and for the year 1941 it was 115.15 per cent of the balance of the system.

In connection with both Items 12 and 13 for all of the years shown on this exhibit, except for 1929, the fuel costs in Florida per unit of traffic were substantially greater than for the balance of the system.

The comparisons contained in my exhibit show that in the span of years from 1929 to 1942, freight train operations [fol. 4798] in Florida were substantially more costly than on the balance of the Seaboard System.

I will now discuss the ratios shown in next to the last column on pages 5 and 6 of my exhibit. These figures show how much of each dollar of revenue was converted into net railway operating income by the three Florida lines, the Southern Region and the Eastern District, including the Pocahontas Region.

In 1923 the three Florida roads were able to convert 17.85 cents of each dollar or revenue into net railway operating income, whereas comparative figures for the Southern Region and Eastern District were 16.04 cents and 14.86 cents respectively. In 1925 the three Florida roads ratio of 19.54 is slightly less than the ratio of 19.76 for the Southern Region and slightly more than the ratio of 18.15 for the Eastern District. In 1929 the three Florida lines ratio 17.70 was slightly greater than the Southern Region ratio of 17.29 but less than the Eastern District ratio of 20.34 by approximately 2½ per cent, which means that the Eastern lines were able to convert 2½ cents more of each dollar of revenue into net railway operating income. For the remaining years shown between 1931 and 1941, the ratio of net railway operating income to operating revenues for the three Florida lines is substantially less than that of either the Southern Region or Eastern District.

The last column on pages 5 and 6 shows rate of return for [fol. 4799] the three principal Class I railways operating in Florida, for the Southern Region and for the Eastern District, including the Pocahontas Region.

In 1923 the rate of return for the three Florida lines combined was 5 per cent, which is slightly more than the return for either the Southern Region or the Eastern District. It is likewise true that in 1925 the three Florida roads showed a rate of return slightly greater than for the Southern Region or the Eastern District; however, for all remaining years shown on the statement, which begins with 1929 and ends with 1941, the rate of return earned by the three Florida lines in each of these years has been substantially less than that earned by either the Southern Region or the Eastern District.

Commr. Aitchison: Now, you have based that on the return on property investment, haven't you?

The Witness: Yes.

Commr. Aitchison: Did you pay any attention to the findings made by the Commission with respect to the valuation of Class I roads?

The Witness: No, sir. This is book investment, cash, materials and supplies.

Commr. Aitchison: You are aware that the Commission made findings with respect to the valuation of the roads in the Southern Region and in the Eastern District for some [fol. 4800] of these years.

The Witness: I understood that the Bureau of Valuation had submitted some figures, and that they had been used by the Cost Section.

Commr. Aitchison: I am talking about formal findings of value made by the Commission. If there were any such, you didn't pay any attention to them?

The Witness: I didn't pay any attention to them, no, sir.

Commr. Aitchison: All right.

By Mr. Gwathmey:

Q. Mr. Wimmer, you have undertaken to show relative costs, Florida versus the rest of the South, in the case of the Seaboard Air Line Railway.

Now, in your opinion, would the corresponding costs for Florida versus the balance of the territory, apply equally in the case of the Atlantic Coast Line Railroad?

A. It is my opinion that it would, yes, sir.

Q. These two railroads pretty much serve the same general territory in Florida, do they not?

A. Yes, sir.

Q. And operate under substantially similar conditions?

A. They have substantially the same composition of traffic.

Chmn. Alldredge: Could I ask one question? What do you consider to be the significance of the book value of the railroad in bankruptcy?

The Witness: Well, I don't know. It is a value that [fol. 4801] represents investment. Whether it can be sustained or not, that is a different question.

Mr. Gwathmey: May we offer in — exhibit 205, Mr. Chairman, and ask that it be received.

Commr. Aitchison: Yes. Without objection it will be received.

(Exhibit 205, Witness Wimmer, received in evidence.)

Mr. Gwathmey: That is all with this witness.

Commr. Aitchison: Cross-examine.

Cross-examination.

By Mr. Hillyer:

Q. Mr. Wimmer, on page 3 of your statement you state that the wages paid to crews operating freight trains in Florida are 32.43 per cent more than for the balance of the system.

Now, does that figure mean that you actually pay a man in a certain employ more for serving in the State of Florida than you do in other states?

A. No, sir.

Q. Now, how do you account for that difference?

A. Light traffic density. These comparisons are based upon traffic units.

Q. You mean then that it then applies on units of traffic and not wages of the crew.

A. My entire comparison has been made on units of traffic.

[fol. 4802] Q. Will you state the method in which the Seaboard records are kept which enables you to make this separation between Florida traffic and the balance of your system?

A. This separation, as I explained in the beginning of my testimony, is for the North and South Florida Divisions, whose accounts are kept separately, on substantially all of these expenses arising on these divisions, which, of course, includes crew, wages and fuel.

Q. How do you arrive at your traffic units? Do you take all of the Florida intrastate traffic and assign that to the Northern Florida Division?

A. No, sir. They work separately by divisions.

Q. Where does your North Florida Division extend to?

A. The North Florida Division begins at Jacksonville. It extends in a westerly direction to River Junction and up to Bainbridge, Georgia from Tallahassee, and also includes a few branch lines on the west end of Florida. It also extends southward from Baldwin to Homestead, to Plant City and to Tampa, via the main line—the old main line, I might say. We have another line which extends from Waldo to Tampa, which is in the South Florida Division.

Q. Well, have you lumped your North and South Divisions in Florida in making these comparisons?

A. Absolutely, yes, sir.

Q. Is it your position then that the same rate level [fol. 4803] should apply on your North Florida Division as your South Florida Division?

A. I don't recall having testified about rates.

Q. Would you think that they should be different?

A. I would have to let a traffic man handle the rate question.

Q. Is there anything in your cost which would warrant making a different rate level for the North Florida Division and your South Florida Division?

A. Nothing that I know of. That is a rate matter beyond me.

Q. Do your traffic units used for your North and South Florida Divisions include all traffic into and out of Florida, for the hauls within Florida; for example, do they, your units of traffic, assigned to your Florida Divisions, include the proportion of the haul south of Jacksonville, on traffic coming from the Northern states?

A. No, it includes all of it that is handled in Florida on the Florida Divisions, North and South Florida Divisions; all of the traffic handled over those Divisions is included in my statistics.

Q. Does it include the traffic both originated and terminated in Florida for the hauls south of the Jacksonville-River Junction line, or all within the State of Florida?

A. I cannot answer that question because our operating divisions are not entirely within Florida. The North Florida Division has something like 15 miles outside of the [fol. 4804] State of Florida, but I think the question you wanted me to answer is, have I included in the North and South Florida Divisions all traffic whether it comes from without the state or is handled within the state. If that is the question, the answer is yes.

Q. I was speaking of expense up to that time. How do you separate your revenues between Florida traffic and other traffic?

A. Substantially a mileage pro rate, except the intrastate in Florida. There are some adjustments made for Florida arbitraries. That is not substantial, though, I don't think.

Q. Your revenue figures on the fourth page here, for the separation for Florida, are they made on an actual basis or a theoretical basis?

A. I don't believe I understand when you say the revenue figures come in.

Q. On page of 4 of your statement you say that on dollar revenue any net railway operating income is converted into—or, you show you convert 17.85 cents of each dollar of revenue into net railway operating income.

A. Mr. Hillyer, those figures are system figures.

Q. Is there any method of making an actual separation on actual traffic or revenue between Florida and non-Florida traffic, according to your figures?

A. You mean, do we make that separation?

Q. I mean, have you the actual separation, yes, upon the [fol. 4805] actual billing.

A. No, we don't have.

Q. How is it arrived at? I am asking you about the revenue now.

A. I am afraid I don't understand your question. You refer to page 4 of my statement, or page 5? Page 5 refers to the Seaboard System's revenues and not to Florida revenue.

Q. I was speaking of page 4, where you refer to so much of each dollar of revenue converted into net railway operating income.

A. That is also for the system, on page 4.

Q. Have you made any separation of that figure between Florida and your system?

A. No, sir.

Q. Then you don't know what ratio your revenue bears to your expense, in Florida?

A. No, sir.

Mr. Hillyer: All right. That is all.

Mr. Smelker: I have one question for clarification, Mr. Wimmer.

By Mr. Smelker:

Q. Mr. Wimmer, will you turn to page 3 of your exhibit, the last two items, 11 and 12, and will you state whether or not the cost includes the expense of origin switching, which you have designated there, because of crew wages and cost of fuel?

A. Well, all coal that we receive and carry into Florida [fol. 4806] is received from Foreign lines, and I do not believe we have any expense where we have foreign line switching involved. We do have a foreign line freight charge.

Q. That is not the question. Is there any yard switching included in the cost you have shown in items 11 and 12?

A. No, sir. This is the coal cost and the tipple charges, but no transportation.

Q. Now, talking about crew wages.

A. Yes, sir.

Q. Item 11, headed "Crew Wages", does any of that expense include origin or destination switching?

A. No, sir. This is crew wages paid to freight train crews.

Q. Line haul traffic?

A. Yes, sir.

Q. Is train switching expense left out?

A: Well, if there was any train movement by the crews on the trains that handled the coal, it would not be eliminated, but I don't know of any switching for the handling of coal.

Q. We are talking about coal especially.

A. I understand, crew wages.

Q. Crew wages.

A. I beg your pardon. No, that is the total wages paid train crews.

Q. And does include or does not include the yard switching.

A. It does not include train switching.

[fol. 4807] Q. It does not include yard switching either?

A. No, sir.

Q. How do you eliminate the train switching?

A. We receive monthly reports, or there are monthly reports made available to us showing the crew wages paid freight crews in train service.

Commr. Aitchison: You will have to talk louder.
The Witness: I am sorry, but I am so hoarse.

By Mr. Smelker:

Q. In what manner do you make this separation; on mileage pro rate or hour pro rate?
A. It is hours, as the original basis, and reduced to miles.

Commr. Aitchison: Is that all?
Mr. Smelker: We are not quite clear as to what accounts we find these figures.
The Witness: These figures.

By Mr. Smelker:

Q. Yes. How do you get the figure of $1.16, for instance, in '29, item 11, on page 3?
A. Well, we have an accumulation of those from the work sheets and it is the ton miles divided into the total crew wages and that gives you the average cost. I have not included in this the total crew wages that we used.
Q. What account do you use for crew wages, then?
A. In the classification?
Q. Yes.
A. You mean in the balance sheet.
[fol. 4808] Q. Yes?
A. Well, the trainmen.
Q. Yard crew and train expense.
A. $3.92 and $4.01.
Q. And other expenses?
A. Yes.

Mr. Smelker: That is all.
Chmn. Alldredge: I believe you stated that you assigned or allocated the freight revenues to those two Florida Divisions on some sort of a mileage pro rate.
The Witness: In the state report, that is the report to the Florida State Commission, the Florida revenue, the Florida proportion of the revenue is assigned on substantially a mileage pro rate, except the intrastate revenue.

Chmn. Alldredge: Now, can you tell me whether or not in assigning your through interstate revenue to those two Florida Divisions, you first grouped them or credit them with the full Florida arbitrary, and then pro rate the balance?

The Witness: I would not say. I would like to say that in the beginning we did not credit those two Florida Divisions. The revenue is credited to the state and not to the two Divisions. There is some other mileage that is not on these two divisions—some other mileage in Florida that is not on these two divisions. It is not substantial, but there is some other mileage.

[fol. 4809] Chmn. Alldredge: I am trying to find out whether you pro rate the arbitrary so that mileage outside of the state would get the benefit of it or do you credit it all to the Florida mileage?

The Witness: We endeavor to credit it to Florida.

Chmn. Alldredge: All of it?

The Witness: Yes, sir.

Chmn. Alldredge: Now, on business that you interchange with other carriers in Florida, do you credit the full amount of these divisions accruing on those Florida lines to those lines?

The Witness: Yes, sir.

Chmn. Alldredge: Is that the way you do it?

The Witness: Yes.

Chmn. Alldredge: And then on through business over the Seaboard System, you first credit to those Florida lines the full amount of the arbitraries and then you pro rate the balance on a mileage basis?

The Witness: I won't say the full amount of the arbitraries, because we do not actually determine them, but there is a formula applied to it where we try to give weight to the full arbitrary. The balance of the revenue is on a mileage pro rate, yes, sir.

Chmn. Alldredge: Do you make any allowance for terminal services which might be included in the rate, or do you [fol. 4810] simply observe a freight mileage pro rate?

The Witness: Freight mileage.

Commr. Aitchison: Do you have the formula which is used as the basis for this proportion?

The Witness: I am not sure that I can give it to you accurately out of my head, Mr. Commissioner.

Commr. Aitchison: It is being used, however, by your assistants in making these calculations?

The Witness: Yes, sir.

Commr. Aitchison: Would you mind explaining that for the record?

The Witness: All right, sir.

Commr. Aitchison: Anything further for this witness? Apparently not. You are excused.

(Witness excused.)

Mr. Gwathmey: Shall I call another witness for this afternoon?

Commr. Aitchison: We will suspend at this time, but I will say that due to another engagement that the Division has in the morning, we will have to adjourn until ten o'clock tomorrow morning. But we hope to run longer hours for the next few days.

(Thereupon, at 4:45 o'clock p. m., a recess was taken until March 30, 1943, at 10 o'clock a. m.)

[fols. 4811-4812a] BEFORE THE INTERSTATE COMMERCE COMMISSION

Docket No. 28300

Class Rate Investigation, 1939

Docket No. 28310

Consolidated Freight Classification

Main Hearing Room,
Interstate Commerce Commission Bldg.,
Washington, D. C.,
March 30, 1943.

Met, pursuant to adjournment, at 10 o'clock a. m.

Before Division 2 of the Commission

Hon. Clyde B. Aitchison (Presiding).

Hon. J. Haden Alldredge (Chairman of the Commission).

Hon. Walter M. Splawn and a Cooperating Committee of the National Association of Railway and Utilities Commissioners, represented by:

Mr. W. H. Scott, of The Public Service Commission of South Carolina.

Mr. George McConnaughey, Public Utilities Commission of Ohio.

Mr. C. L. Doherty, South Dakota Public Utilities Commission.

Present: Paul O. Carter, Examiner; W. J. Koebel, Examiner; T. L. Haden, Examiner; W. U. Hardie, Director, Bureau of Traffic; J. J. Murphy, Consultant.

Appearances:

As heretofore noted, and Charles T. Abeles, Seaboard Airline Railway Building, Norfolk, Va., appearing for Seaboard Airline Ry. Receivers.

[fol. 4813] Proceedings

Commr. Aitchison: You may proceed.

Mr. Gwathmey: I will call Mr. Ormond.

Mr. Grey: Mr. Chairman, yesterday I reserved cross examination of Mr. Weeks, and I find that I have no cross examination.

Commr. Aitchison: Very well.

Lewis F. Ormond was sworn and testified as follows:

Direct examination.

By Mr. Gwathmey:

Q. You are Mr. Lewis F. Ormond, and you testified previously at the Columbus hearing, did you not?

A. At the Indianapolis hearing.

Q. Mr. Ormond, I believe your official position with the Atlantic Coast Line Railroad Company has changed since the time when you testified before. Is that correct?

A. That is correct, sir.

Q. What is your present position?

A. As comptroller.

Q. You are now comptroller of the Atlantic Coast Line Railroad Company?

A. Yes, sir.

Q. Have you prepared and distributed one exhibit which you desire to offer at this time?

A. Yes, sir. It consists of four typed pages with a cover [fol. 4814] sheet and a back.

Mr. Gwathmey: Mr. Chairman, may we have it identified?

Commr. Aitchison: That will be Exhibit 206.

(Exhibit 206, Witness Ormond, marked for identification.)

By Mr. Gwathmey:

Q. Please proceed, Mr. Ormond, to explain briefly what you have shown in this exhibit.

A. This Exhibit 206 is directed toward Witness Saunders' Exhibit No. 87, which Mr. Saunders said in his testimony at pages 1632 and 1633 of the record was introduced at the request of the Florida Railroad Commission.

The first sheet of my exhibit is simply a reproduction of Mr. Saunders' exhibit and is put here for ready reference.

In considering Mr. Saunders' exhibit it became apparent that the point that he was striving to make was the heavy earnings of the three principal Florida lines in the 1942 period that he shows on his exhibit, shown as the seven months of 1942.

He demonstrated thos- heavy earnings by developing the rate of return represented by net railway operating income on the rate-making value as found by the Commission for each of the railroads for the purposes of this case, adjusting——

Q. Pardon me. You didn't mean to say, did you, that the Commission has found any such values for the purposes of this case?

[fol. 4815] A. No, I beg your pardon. It was a value that was produced by the Bureau of Valuation and has been used in this case. It does not represent a Commission finding, as I understand it.

Mr. Saunders adjusted that value by adding to or taking from the base figure as of December 31, 1939, certain amounts which he assigned to each of the years appearing on the exhibit, namely, the years 1937 through 1941.

I have been unable to check his additions and subtractions from the base figure but I don't think it is of a great deal of importance whether or not they are checked.

He doesn't seem to have done anything with his changes in the year 1939, if the amount set out in the columns for the other years truly represent the property changes occurring in those years, but as I say, I do not consider that as a great deal of importance.

The second sheet of the Exhibit No. 206, looking at the data at the right hand part of the exhibit, is more or less a reproduction of Mr. Saunders' data for the Atlantic Coast Line, except that I have developed an average for the five years from 1937 to 1941.

You will observe that the average rate of return represented by net railway operating income applied to the Bureau of Valuation's value, as adjusted by Mr. Saunders, is 2.49 per cent for the five years collectively.

The next sheet is a similar statement for the Seaboard [fol. 4816] Air Line, and here it develops that the average rate of return for the five years 1937 to 1941 is 2.44 per cent.

The fourth sheet is similar in characteristics and relates to the Florida East Coast and here the average rate of return for the five year period is 1.97 per cent.

I have developed that average in order to give some idea of the level of the return, even when applied to the value which the Bureau of Valuation has produced during the five previous years in order to make the point, if it is a point, that the heavy return in the seven months period of 1942, to which Mr. Saunders directs attention and read into the record in his testimony, is an abnormal thing. I think we all know it is abnormal. It has no relationship to the past, as this statement clearly shows, and we are all perfectly confident that it has no relationship to the future.

I do not think it should have any weight in a case involving the promulgation of rates——

Commr. Aitchison (Interposing): Well, I understand Mr. McCollester always objects to witnesses answering questions of how much weight should be attached in a rate-making proceeding.

Mr. Gwathmey: Leave that to the Commission, but incidentally, Mr. Chairman, may I call your attention in that connection to the recent observations of the Supreme Court of the United States in the Milwaukee Reorganization Case [fol. 4817] with reference to present day earnings as a guide?

Proceed, Mr. Ormond.

The Witness: My purpose in referring to the year 1942, and making the remark I made, is that it is the point Mr. Saunders made that the year 1942 showed such excessive earnings for the Florida Railroads, and I think there is no use in whipping a dead donkey; I think it is obvious to all of us that that is an abnormal condition.

Commr. Aitchison: If you were to complete the page that you have just been referring to of the Seaboard Air Line, and instead of the seven months of 1942 showing $16,485,264 net railway operating income adjusted, were to insert a figure which compares with the five preceding months, that is on an annual basis, the figures you would insert would be $30,445,971, would it not?

The Witness: The Seaboard contends that it would be $33,945,971. There is an adjustment in regard to taxes, tax accruals; that is in controversy.

If we used the figure to which the Commission adjusted the Seaboard's returns, we would use the figure you have referred to, yes, sir.

That would represent a return on the Bureau of Valuation value of 14.79 per cent in order to complete the statement all the way, and the similar figure for the Coast Line would represent a return of 9.71 per cent, and for the [fol. 4818] Florida East Coast 15.39 per cent.

I think those large amounts and large percentage rates of return merely emphasize the point which I am striving to make in connection with these returns for the year 1942.

If you will look in the left hand section of sheet 2 of my exhibit, and using the Atlantic Coast Line for illustration, I will explain what I am striving to show there.

The first figure is the cost of reproduction less depreciation, excluding lands and rights as of January 1, 1937, for the Atlantic Coast Line, which was produced and used by the Commission, I believe, in Ex Parte 123, Exhibit 68.

Immediately below is the cost of reproduction, less depreciation, except land and rights as of January 1, 1940, both of these being for the Atlantic Coast Line, which was produced and used in Ex Parte 148, Exhibit A-11. These are both figures that have been used in proceedings, and over which the railroad had no control, and in which it had no participation.

Comparing these two figures it is obvious that between January 1, 1937 and January 1, 1940 there has been a decrease in the valuation of $11,194,137.

To that I add the net increase in investment represented by carrier expenditures, less retirements, in the three years that intervened between the dates that I have shown, amounting to $2,485,800, and thus produce a decrease net [fol. 4819] between the two dates of $13,679,937.

We recognize that a part of that increase is explained by depreciation on equipment, which we have accounted for, amounting to $6,184,410.

That leaves a decrease which is unexplained so far as this exhibit is concerned of $7,495,527, or an average of $2,498,509 per annum of three years.

Sheet 3 for the Seaboard is worked in exactly the same way and it produces an unexplained decrease of $24,524,156, or an average decrease per annum of $8,174,719.

Sheet 4 for the Florida East Coast produces an unexplained decrease of $13,105,751, or an average per annum of $4,368,584.

Let's consider those decreases here. In the first place, it is rather peculiar to find the decrease for the Florida East Coast, a comparatively small line, greater than for the Atlantic Coast Line.

Commr. Aitchison: Mr. Gwathmey, you had an opportunity to query our representative about this if you desired further explanation. Why should we have to speculate as to why the Bureau made the reductions?

Mr. Gwathmey: Well, your Honor, I don't understand that Mr. Ormond is dealing directly with that feature.

Commr. Aitchison: I thought he was.

Mr. Gwathmey: But to whatever extent he is dealing with it, I think you probably have gathered by this time [fol. 4820] that the railroads didn't at all agree with the valuation figures which were furnished by the Commission, and we have heretofore in this case undertaken to point out certain objections to them, that we think are proper.

Mr. Bell: What do you mean, "furnished by the Commission"?

Mr. Gwathmey: By the Bureau.

Mr. Bell: Oh, the Bureau of Valuation?

Mr. Gwathmey: Yes.

Commr. Aitchison: They were introduced, Mr. Bell, by the Commission. The Commission itself tendered the exhibit and there was no objection.

Mr. Bell: Are you speaking of this case?

Commr. Aitchison: I am speaking of this case.

Mr. Gwathmey: May Mr. Ormond finish his statement?

Commr. Aitchison: Proceed.

By Mr. Gwathmey:

Q. Go ahead.

A. I was calling attention to the wide variation between the unexplained decreases in the case of the three railroads involved.

The Coast Line and the Seaboard are very similar to the same first class set-up, and there is not a great deal of difference in the miles of road which they operate. That is one point I want to make in connection with these matters.

The second one is this; here I get to the true purpose of the comparisons.

[fol. 4821] Unquestionably some part of those unexplained decreases (and a substantial part, I should say, in the case of the Coast Line) is represented by depreciation on road property which has been applied as a reduction in the interim by the Bureau of Valuation. I don't know how much that is, and I don't think it is particularly important to ascertain.

The main point is that that depreciation on road property, which has been applied as a reduction of the values which Mr. Saunders uses, has not been applied as a reduction of net railway operating income which he uses in the development of the return which he shows.

If our value is going to be cut down by depreciation (and in using the word "our" I am referring to the three roads collectively) and we are to be charged with determining this rate of return or that rate of return on the value this reduced, we feel that net railway operating income should be reduced to the extent of the depreciation which has been applied to reduce value.

Commr. Aitchison: Have you any statement showing the amount which was charged during the periods that you have shown in your exhibit here to depreciation of way and structures and equipment and to amortization of defense projects?

The Witness: The depreciation of equipment, Mr. Chairman, is shown on the exhibit.

[fol. 4822] Commr. Aitchison: This exhibit?

The Witness: Yes, sir, at the left.

In the case of the Coast Line it amounted to $6,184,410, and that figure has been taken out before developing what I have referred to as the unexplained decrease.

Mr. Gwathmey: Line 6, Mr. Chairman, in the left hand corner of the exhibit.

The Witness (Continuing): There have been no amounts charged in the years 1937, 1938 and 1939, which is the period with which I am dealing, to depreciation of way by any of these roads, and neither did any of them charge in that period anything for amortization of defense facilities.

Commr. Aitchison: If that had been charged, it would have pulled down your average rate of return for these years shown, I believe, would it not?

The Witness: Yes, sir, if it had been charged.

Commr. Aitchison: How about the year 1942 with respect to the amortization of defense projects?

The Witness: There was a substantial sum charged in the accounts of the Coast Line and the Seaboard for amortization of defense projects, in the year 1942, and there was no depreciation in that year.

Chmn. Alldredge: Was that the first year you charged a sum for amortization? 6

The Witness: That was the first year it was permissible.

[fol. 4823] Chmn. Alldredge: 1942?

The Witness: Yes, sir.

Commr. Aitchison: Are you certain of that?

The Witness: I believe it was made optional in 1941, but I am not quite sure of that. I would hesitate to answer.

Chmn. Alldredge: Was that on a five year period?

The Witness: Over a period of 60 months, yes, sir.

Chmn. Alldredge: Sir?

The Witness: 60 months, or five years.

Commr. Aitchison: As a matter of fact, there was quite a considerable sum that was charged to amortization of defense projects in the year 1941 by all of the Class I railroads.

The Witness: Taking them collectively, yes, sir, but there was none charged by the three railroads I am dealing with here.

Commr. Aitchison: That may be.

The Witness: Yes, sir.

Commr. Aitchison: But you said it was not permitted.

The Witness: I think it was made optional. I corrected that. It was made mandatory effective January 1, 1942.

Those are the only serious points I have to make in connection with this exhibit.

If you would reduce the net railway operating income of these years to the extent of depreciation on road, which [fol. 4824] must have been taken into consideration by the Bureau of Valuation, you would find that the rate of return which Mr. Saunders has shown, and which I have averaged, would be substantially reduced.

By Mr. Gwathmey:

Q. Does that complete your discussion of the exhibit?

A. Yes, sir.

Q. Mr. Ormond, in the course of the cross examination of the witness Donnell with reference to Exhibit 70, filed by Mr. Hinnant, which dealt with the ton miles of revenue freight per mile of road for Florida as compared with that for North Carolina for the year 1940, mention was made of the authority for the figures shown in that exhibit, being annual reports filed with the Florida Railroad Commission, and Mr. Donnell at page 1893 of the transcript said:

> "Mr. Hinnant and other Florida carrier representatives have testified in many previous cases that those figures bear no relation to the actual facts; that they are predicated on formulas and have no meaning whatever."

Are you familiar with the method in which the annual reports made by the Atlantic Coast Line Railroad to the Florida Commission are compiled?

A. Yes, sir.

Q. What have you to say as to the correctness of the figures as shown in those reports and in Mr. Hinnant's [fol. 4825] exhibit relating to the ton miles of revenue freight in Florida as compared with other states.

A. They are as exact as it is possible to produce.

We take every waybill representing a movement either wholly within the state or one within and without the state, in other words, intrastate and interstate, compute the miles of the shipment and compute the revenue ton miles for Florida on the basis of the actual movement of the shipment.

Q. When you come to consider operating expenses it is true, is it not, that the railroads have said that the formula which is used, and which was put out by the Florida Commission, is not accurate.

A. Exactly so.

Commr. Aitchison: Have you ever proposed a better one?

The Witness: No sir.

Chmn. Alldredge: You didn't want to furnish that information at all, did you?

The Witness: Absolutely not. A railroad system is not operated with regard to state lines and it can't be without a very material increase in the expense all up and down the line.

Commr. Aitchison: As an expert statistician, if the Atlantic Coast Line were to be contesting an order of the Florida Railroad Commission which seriously affected freight rates, would you or would you not undertake to [fol. 4826] make the necessary separations to show whether or not the returns would be confiscatory, if instructed to do so?

The Witness: If I were instructed to do, of course I would endeavor to make them, but I would go at it with fear and trembling, because it is practically an impossibility so far as operating expenses are concerned to separate them on state lines.

Commr. Aitchison: Did you ever hear of the so-called Oliver formula?

The Witness: No, sir, I don't think I have ever seen it.

Commr. Aitchison: Have you ever investigated to see whether or not formulae have been devised which have been sustained and used by the Supreme Court of the United States on the basis of testing whether state rights were confiscatory or not?

Mr. Gwathmey: Mr. Chairman——

Commr. Aitchison: I want to test whether or not this gentleman is advised when he says that it is not a feasible thing to do.

The Witness: I mean no disrespect to the Supreme Court, to this honorable Commission, or to anybody else, but I nevertheless maintain the position that it is practically an impossibility to accurately separate operating expenses by state lines.

Commr. Aitchison: Would you say that it was impossible—[fol. 4827] practically impossible, I think is the phrase you used—to do it so as to yield a result on which you or your company would act in a matter of high moment to itself?

The Witness: If it was a matter of high moment, if the rates involved that it was proposed to be reduced were vitally important, we would do the best we could. We have done that in a number of other cases. In fact, we have done it in this case here, in making answer to Dr. Edwards' questionnaire we put it in to the best of our ability, but I certainly don't agree with it.

Commr. Aitchison: I was trying to get away a little bit from this lawsuit idea, and put it that if it was a matter of high moment to the Atlantic Coast Line to be able to tell what the expense of its operations in Florida was, so that it could take an action which affected it, would you or would you not feel that you could produce that figure so that the Atlantic Coast Line would be able to act upon it in this matter of high moment? I am not talking about a lawsuit.

The Witness: All right, sir, let me answer this way, and I hope it will be direct enough.

If the amount involved was sufficient—I said "practically impossible"—it is possible, of course, to separate the operating expenses at a state line. We could put a man on every train and an accountant on every train, and we could separate them, and therefore my answer to you is [fol. 4828] that if the amount at stake was large enough we could and would separate them, but it is not an economically practical thing to do.

Commr. Aitchison: Do you, in saying with respect to this Florida arbitrary, that it is not the practical thing to do to make this separation, do you or do you not take into consideration that we are virtually dealing with an annuity, the capitalizable value of which runs into many millions of dollars.

The Witness: Are you speaking of the Florida arbitrary on rates?

Commr. Aitchison: Yes.

The Witness: I am not informed particularly as to that, Mr. Chairman.

Commr. Aitchison: You haven't taken that into consideration in determining the feasibility of making that separation?

The Witness: I thought we were talking about the separation of operating expenses and not revenues.

Commr. Aitchison: That is what I am talking about. You have said you could separate the revenues.

The Witness: Your point is that in separating the expense we develop a net that would have a bearing on the value of the Florida arbitrary.

Commr. Aitchison: Yes.

Mr. Gwathmey: Mr. Chairman, may I recall to your mind [fol. 4829] the fact that yesterday Mr. Wimmer, a witness for the Seaboard, did make a separation of operating results, including costs on the Florida peninsula, as compared with the balance of the Seaboard System, and he was able to do that because of the somewhat peculiar method by which the accounts of the Seaboard are kept by divisions.

Commr. Aitchison: I take it, then, that in that case it was feasible.

Mr. Gwathmey: What is that?

Commr. Aitchison: It was feasible in that case.

Mr. Gwathmey: On account of the manner in which the Seaboard keeps its accounts, it was possible to make a separation between the Florida Divisions and the rest of the system.

Commr. Aitchison: Am I to understand feasibility depends upon the manner in which the carrier keeps its accounts?

Mr. Gwathmey: Yes, sir. They keep their operating expenses separate as to divisions, or rather I should more properly say, I think, they keep them separated as to mortgaged lines under an order of the Federal Court.

The Witness: And it is just a fortuitous circumstance that the divisions in the case of the Seaboard, with the exception of 16 miles overlap, 15 or 16, fall all within Florida.

Mr. Gwathmey: Shall I proceed, sir?

[fol. 4830] Commr. Aitchison: Yes.

Mr. Gwathmey: Mr. Chairman, may I ask that the exhibit that has been referred to and identified be received?

Commr. Aitchison: Without objection it is received.

(Exhibit 206, Witness Ormond received in evidence.)

Mr. Gwathmey: That is all.

Commr. Aitchison: Cross examine.

Mr. Bell: May I ask one question?

Commr. Aitchison: Yes, Mr. Bell.

Cross-examination.

By Mr. Bell:

Q. Do you know whether or not there were increases in the prices of material and the cost of labor entering into railroad construction January 1, 1940 over January 1, 1937?

A. I suspect that there were. I would not care to answer that definitely. I do not think they were important in those particular years.

Mr. Bell: That is all.

Commr. Aitchison: Cross examine.

Cross-examination.

By Mr. Hillyer:

Q. I would like to ask a few questions which are more or less trite, but merely to have the record clear.

The Atlantic Coast Line Railroad operates in what states?

A. Florida, Georgia, Alabama, North and South Carolina and Virginia.

[fol. 4831] Q. And in what states do the lines comprising the Atlantic Coast Line System operate?

A. The same ones that I have just given you.

Q. Is the L. and N. Railroad financially related to the Atlantic Coast Line Railroad?

A. We own a controlling interest in the stock of the L. and N.

Q. And the L. and N. covers other states in the South, other than those you have named?

A. I understand that it does, yes, sir.

Q. So that the Atlantic Coast Line Railroad and the L. and N, would you say, generally cover southern territory?

A. Yes.

Q. Is it not a fact that the Atlantic Coast Line Railroad is not only a Class I railroad, but also a Class A railroad?

A. I don't know what you mean by Class A, Mr. Hilyer.

Q. I mean is it not efficiently operated?

A. Yes, sir, I think it is.

Q. It has modern equipment.

A. Reasonably so.

Q. And gives excellent service?

A. We claim that we do.

Q. You agree then that it is a Class A as well as a Class I railroad.

A. I would have to know what a Class B was before I could answer that question.

[fol. 4832] Mr. Hillyer: That is all.

Commr. Aitchison: Anything further of this witness?

Mr. Smelker: I have one question, for clarification.

Commr. Aitchison: All right.

Cross examination.

By Mr. Smelker:

Q. Referring, for example, to page 2 of your exhibit, Mr. Ormond, would not some of the unexplained decreases in value shown in line 7 be accounted for by charges to profit and loss?

A. I don't see how they could be, sir.

Q. For example, Dr. Edwards testified at page 55 of his prepared statement that the Southern region charged profit and loss of $7,511,659 in 1939.

A. On account of what?

Q. On account of property retired but not accounted for by depreciation.

A. All retirements, Mr. Smelker, are taken into consideration in the figure of $2,485,800.

That is the net excess of additions and betterments over retirements, regardless of whether the retirements were charged to profit and loss or to operating expense, it is the net increase in the property investment account.

Mr. Smelker: That is all.

Commr. Aitchison: Here we have apples and oranges. Items 1 and 2 relate to costs of reproduction.

[fol. 4833] The Witness: Yes, sir.

Commr. Aitchison: Item 4, if the account is properly stated, goes back to original cost, does it not?

The Witness: No, sir, not necessarily. You mean to the extent that retirements are involved?

Commr. Aitchison: Yes, surely.

The Witness: Not necessarily. On an old railroad, such as the Coast Line, we don't know what the original cost of a large part of our property is, and under the commonly followed practice, we estimate that original cost when we don't know it as being equivalent to the cost of reproduction, as found by the Commission at the date of valuation.

Commr. Aitchison: Well, estimated original cost then instead of original cost?

The Witness: Yes, sir.

Mr. Bell: That is June 30, 1914.

The Witness: Our date of valuation is June 30, 1917.

Mr. Bell: I know, but your costs are all the same, irrespective of your date of valuation.

The Witness: The costs are based, as I understand it, on an average of prices in effect during the period from 1910 to 1914.

Commr. Aitchison: That is the cost you write out on.

The Witness: Yes, where our books do not reflect the actual cost.

[fol. 4834] Commr. Aitchison: Well, I just wanted to point out that you are deducting original cost, or an estimate of original cost, from cost of reproduction, and then because it doesn't value out, you say it is an unexplained decrease.

The Witness: I believe, Mr. Chairman, that I said that my point in developing that unexplained decrease was to bring out that unquestionably a part of it is roadway depreciation.

There probably are other factors besides roadway depreciation and besides the one you have mentioned that entered into it.

The multipliers used by the Bureau of Valuation in developing their value as of the two different dates quite probably were different.

Commr. Aitchison: You have no doubt at all that the multiplier which was used with respect to this retired property was considerably in excess of the charge-out amount, have you?

The Witness: I just don't know about that. I really don't know.

Commr. Aitchison: Well, those are all published by the Commission. The cost of reproduction unquestionably exceeds the estimate of original cost, doesn't it?

The Witness: The cost of reproduction, less depreciation, exceeds the original cost.

Commr. Aitchison: And therefore the cost of reproduction would too?

[fol. 4835] The Witness: Not in our case, sir.

Commr. Aitchison: The cost of reproduction exceeds the cost of reproduction less depreciation in your case then.

The Witness: The cost of reproduction, as estimated by the Commission at date of valuation is exceeded by both the estimated original cost and the final value. Let me state that differently. The final value is slightly exceeded by our book value. Those figures are in this record. I read them into the record in Indianapolis with respect to the Coast Line.

Commr. Aitchison: All right.

Mr. Hillyer. That will be all.

Commr. Aitchison: You may be excused.

(Witness excused.)

Mr. Gwathmey: Mr. Parsons, will you take the stand?

R. K. Parsons was sworn and testified as follows:

Direct examination.

By Mr. Gwathmey:

Q. Will you give your name, your residence, and your official railroad position?

A. My name is R. K. Parsons. I am general freight agent of the Florida East Coast Railway (Scott M. Loftin and John W. Martin, Trustees), with headquarters at St. Augustine, Florida.

Commr. Aitchison: I don't see why it isn't copied in.

[fol. 4836] Mr. Wwathmey: Mr. Chairman——

Commr. Aitchison (Interposing:) Mr. Gwathmey, there are eight men on this Commission who are not here, and there are some 45 State Commissions not represented who are going to deal with this on the basis of the written record.

If it will help any, we will turn this over to an Examiner so that you will not be embarrassed, but it seems to me that it is farsical for us to have to sit here and listen to a statement read which can just as well be put in in the manner indicated, and then discuss it fully on argument.

Mr. Gwathmey: Very well. I will be very glad to try to meet your Honor's wishes.

Commr. Aitchison: It will be copied in. If there is no objection this may be copied in as if the witness had given it orally.

The Witness: I have held an official position with the Florida East Coast Railway for the past nine years. Prior to that time, I was employed by the Atlantic Coast Line Railroad and spent nine years on various assignments in its freight traffic department. With the exception of a year and a half during the last world war, I have been regularly engaged in railroad traffic work since February, 1915.

I was admitted to practice before the Interstate Commerce Commission in April, 1935.

My duties with the Florida East Coast Railway require [fol. 4837] the study of the many rate adjustments and transportation conditions affecting the Florida East Coast Railway, as well as the preparation and presentation of matters affecting its interests before the Interstate Commerce Commission and the Florida Railroad Commission.

The Florida East Coast Railway Company is a railroad operating entirely within the State of Florida. Its rails run from Jacksonville in a due south direction to Florida City, Florida, a distance of 396 miles, with important branch line operating from New Smyrna, a point 125 miles south of Jacksonville, to Lake Harbor, Florida, in a general southwesterly direction. The branch line is 195 miles in length, serving an important vegetable producing area. It is the only Class I railroad operating in the State of Florida with all of its rail property located in that state.

Exhibit No. 92, filed by Witness Maurer at the hearing in these proceedings in Indianapolis in September, 1942, includes a statement of the class rates that would result from the application of the Docket 15879 Appendix E Class Rate scale between Miami, Florida, on the one hand, and representative points in Official Territory on the other hand.

Comparison is likewise made with the present published class rates between Miami, Florida, and those some Official Territory points. This statement is indicated by page M-67 of the exhibit referred to.

[fol. 4838] Witness Maurer stated that special studies of the class rates between Florida and Official Territory had been made by him on behalf of the Railroad Commission of the State of Florida (page 2 of his testimony).

Witness Maurer also stated, "My studies as to Peninsula of Florida form a basis for the position of the Florida interests in that the Florida arbitraries are no longer practical or justified and should be removed; and that whatever basis of class rates may be prescribed for the South or between the South and the North should include Florida as a part of the South". (Page 3 of his testimony). He also stated, "It is my opinion . . . that no higher level of class rates should prevail from the South, including Florida to the North, than applied within the North for like distances". (Page 8 of his testimony.)

It thus appears that one of the definite issues in this proceeding is the question whether the so-called Florida Peninsula arbitraries should be eliminated in connection with whatever basis of rates may be applied throughout other portions of Southern territory.

These arbitraries, as is well known, were originally prescribed by the Commission in Southern Class-Rate Investigation, Docket 13494, the original decision in which was dated July 7, 1925. Several supplemental reports were thereafter issued and the rates finally became effective [fol. 4839] January 15, 1928.

In that case, as well as in other decisions in which the Commission has prescribed commodity rates to and from points in the Florida Peninsula and has allowed the so-called Florida Peninsula arbitraries, the Commission has invariably made it clear that the arbitraries were allowed by reasons of conditions peculiarly affecting railroad operations and traffic in the Peninsula and has stated that they were intended for the benefit of the Florida railroads, and should be allowed in dividing through rates before prorating the remainder of the through rate.

The Florida Railroads understand, of course, that the question of divisions is not an issue in this proceeding. Under the circumstances, however, they believe that attention should be directed specifically to the serious effect upon the revenues of these railroads if the proposals advocated by the Florida interests should be adopted by the Commission.

The annual reports of the Florida East Coast Railway for the years 1938 and 1939 show that of the tonnage originated by the Florida East Coast Railway, fruits and vegetables represented, for the two-year average, 34.8 per cent of the total tonnage originated while the percentage of gross freight revenue which accrued to the Florida East Coast Railway on its originated fruit and vegetable tonnage represented 36.34 per cent in 1938, and 24.57 per cent in 1939 [fol. 4840] of the total carload gross freight revenue of the Florida East Coast Railway for those years. The importance of this originated fruit and vegetable traffic, especially to the Florida East Coast Railway is, therefore, apparent.

The rates on vegetables from Florida to all destinations were prescribed by the Commission in the Southern Vegetable cases, Dockets 16939 and 25071, wherein the several varieties of vegetables were grouped, and rates made on certain fixed percentages of first class were prescribed for each such group. Although this decision resulted in serious reduction in revenue on the Florida vegetable movement, the carriers have subsequently, on account particularly of truck competition, made a general reduction in these rates approximately 15 per cent.

Should the basis now proposed by the Florida shipping interests be adopted, and should the Official Territory level of class rates be applied in the South, coupled with the elimination of Florida arbitraries, the resulting class rates to points in Official Territory would in most instances be substantially lower than the corresponding commodity rates on vegetables.

If the class rates should be reduced to the extent above described, the Florida railroads would inevitably be confronted with demands for reductions in the vegetable rates. These railroads had sufficiently disagreeable experience in [fol. 4841] the past where the commodity rates on vegetables were in some instances higher than class rates, growing out of the practice by shippers of routing via unnatural or unworkable routes, sometimes referred to as "monkey routes", in order to avoid the application of the higher commodity rates and obtain the benefit of the lower class rates.

The basis for divisions of the vegetable rates from Florida to Official Territory was fixed by the Commission in

Docket 24160, having been treated as presenting a special case, in which the prescribed basis of divisions was different from the basis prescribed for general application between the remainder of the South and Official territory. Without undertaking to set forth the proportions of the respective participating lines as thus prescribed, I wish to call attention to the fact that the adoption of the proposal here advanced by certain Florida interests, and an adherence to the divisional basis which the Commission has fixed would mean that the revenue on vegetables of the railroads south of the gateways, including the Florida peninsula railroads, would be heavily reduced, having in mind that fact that on this new basis of rates, the arbitraries, which are specifically fixed for the benefit of the Florida peninsula railroads, would be eliminated.

Based upon the 1938-1939 season we have estimated that on the Florida East Coast Railway vegetable origination [4842] alone, not to mention the vegetable traffic originated in Florida by the Atlantic Coast Line Railroad, and the Seaboard Air Line Railway, the annual loss to the southern railroads, if divided on the vegetable divisions fixed by the Commission, would be $321,423, and to the Florida East Coast Railway alone would be $127,030. The northern railroads would receive a revenue reduction of $81,096.

Should the Official level of class rates be applied and the equal factor class rate divisions under Docket 24160 be used, which, however, we would oppose by every means available to us, the resulting annual losses to the southern railroads would be $672,711, and to the Florida East Coast Railway alone $306,364, while the northern railroads would receive increased revenues of $270,192.

While no attempt has been made to estimate the amount of revenue which is derived from the Florida arbitraries as such, it cannot be doubted that the revenue losses which would result directly from the elimination of the arbitraries would be very substantial.

For example, the first class peninsula arbitrary from Jacksonville to Miami, is 23 cents per 100 pounds and the arbitraries on commodities, including fruits and vegetables, bear certain fixed percentages to first class. It can readily be seen, therefore, that a very large volume of tonnage and revenue is either directly or indirectly involved.

[fol. 4843] Speaking for the Florida railroads as a whole, we wish to emphasize that the adoption of the Florida shipping interests' proposed adjustment, carrying with it the elimination of the arbitraries which were specifically allowed for the benefit of the Florida peninsula railroads, would be disastrous from a revenue standpoint. The Florida peninsula railroads would be compelled to use every available effort to have the division of class rates, which the Commission fixed in Docket 24160, reconsidered by the Commission.

Witness Maurer, in his testimony, stated that, in his opinion, the Commission intended the Florida arbitraries as a "temporary or transitional basis awaiting the outcome of the railroad and industrial expansion which was taking place within the State at that time.

I call attention that the statistical data extracted from the annual reports on file with the Interstate Commerce Commission, which show total operating revenues for the Florida East Coast Railway for the year 1928 of $13,874,723 and for 1940 of $10,748,838. In no year since 1928 have our total operating revenues been equal to thos- of 1928. These figures don't support the opinion held by Mr. Maurer that the outcome which he feels the Commission anticipated came about. On the contrary, the reverse is indicated from the total operating revenues shown.

Witness Maurer makes the statement that the class rate [fol. 4844] structure from Florida has been a very important factor in the rapid development of Florida's water-borne traffic. It is our confirmed opinion that the class rates have had nothing to do with these conditions.

Up to the time the I. C. C. Docket 13494 Class Rate Investigation, which prescribed the Florida peninsula arbitraries, was under consideration by the Commission, the United States Government harbor expenditures at the Florida East Coast ports had not been of substantial proportions.

Information obtained from the annual reports of the War Department, Chief of Engineers, U. S. Army, indicates that up to June 30, 1925, the United States Government had spent, in the development of the harbor at Miami, Florida, only $1,201,709.

The Federal Government had not spent any money in the improvement of the port at Port Everglades, Florida, nor the improvement of the port at Palm Beach, nor the deepening of the harbor at Fort Pierce up to that time. Only

$228,054 of Federal funds had up to that time been spent on the east coast canal from Jacksonville to Miami.

The latest report released by the District Engineers, U. S. Army, indicates that, up to June 30, 1941, the United States Government had spent, to develop the harbor at Miami, Florida, $7,873,529. Additionally, the City of Miami had used $5,492,892 of public funds to improve the harbor [fol. 4845] facilities. This harbor has a depth of 29.6 feet.

There is another deep water harbor only 23 miles north of Miami, Florida. It is Port Everglades, Florida. It has been developed entirely since 1926. To June 3, 1941, the Harbor District and the United States Federal Government spent $7,176,703. It was a harbor with water depth of 32.4 feet.

45 miles north of Port Everglades is still another deep water harbor, the Port of Palm Beach, which was developed at an expense to the Harbor District and the United States Government of $4,577,025. It has a depth of 20 feet.

55 miles north of the Port of Palm Beach is still another deep water harbor. This development, like the one at Port Everglades, has come about since 1926. This port was developed at an expense up to June 30, 1941, of $3,393,752. It has a depth of 24 feet.

It is pointed out that there is, within a 125 mile Florida east coast shore line, four deep water ports capable of accom-odating practically any craft in the coastwise service.

Additionally, vast sums have been expended on the East Coast Canal, known as the Florida Inland Navigation District. Official records of the Florida Inland Navigation District show that the sum of $12,178,055 has been devoted to making and keeping the avenue of transportation open. It has a minimum depth of 8 feet of water from Jacksonville to Miami.

Well in excess of the staggering sum of $41,575,054 has [fol. 4846] been spent on harbor and waterway developments along the east coast of Florida within the past 20 years.

Rebuttal facts respecting the Florida East Coast feature of the financial exhibit presented by Witness Saunders at the Indianapolis hearing, and to which was assigned Exhibit No. 87, are being presented by another Florida East Coast Railway witness, but I wish to state, in connection with that exhibit, that the revenue information shown with respect to the Florida East Coast Railway for the first seven months of 1942 is susceptible of misinterpretation unless the circumstances incident to its accrual are treated with.

The normal southbound traffic of the Florida East Coast Railway was seriously retarded by the outbreak of the war and the revenue improvements since then — account of the Florida East Coast Railway Company are attributed entirely to traffic which will disappear with the termination of the war or with improved ocean shipping situation.

Indicative of the correctness of this observation, the Florida East Coast Railway originated only 1,595 carloads of citrus fruit during the first seven months of 1941. By reason of the temporary suspension of coastwise steamer service, the Florida East Coast Railway originated during the first seven months of 1942 (the period treated with by the Witness Saunders) 7,240 carloads of citrus. This unusual situation accounts for approximately one-half million [fol. 4847] dollars of the Florida East Coast Railway revenue improvement.

Since 95 per cent of the citrus fruit originated on the East Coast of Florida normally moves to the North Atlantic Seaboard territory, and for years prior to 1942 such proportion as the Florida East Coast Railway originated moved on extremely depressed rates, representing an exact equalization of the freight rates charged via truck-boat routes, there is small reason to feel that, with the return of the coastwise steamer lines, the Florida East Coast Railway normal situation with respect to this traffic would be any different than it was prior to the war.

The submarine situation since January, 1942, has caused the unnatural movement of Cuban raw sugar through Miami, Port of Palm Beach, and Port Everglades, Florida, ports served by the Florida East Coast Railway. Over 3,500 carloads destined to the East have been moved through these ports. In normal times, this traffic could not have been controlled except via all water routes and it accounted for approximately another half million dollars of Florida East Coast freight revenue improvement.

An unusual and purely war endeavor import movement of Blackstrap molasses handled through the Florida ports since Pearl Harbor and destined for North Atlantic Seaboard alcohol manufacturing plants, and which normally moves from Cuba to North Atlantic Seaboard in tank steamers owned or operated by the alcohol manufacturing inter-

[fol. 4848] ests, has been responsible for a 1,405 tank car lot movement of good revenue traffic, which may not even recur during the present situation, and would most certainly disappear with the termination of war conditions.

Since January of this year, a number of military camps have been established on the East Coast of Florida, and the principal ones being Camp Griffith at Boca Raton, Florida, and Camp Murphy, near Stuart, Florida. The materials going into the construction of these two military camps has represented thus far this year 3,994 carloads. Even if, during peace times, these military camps should be continued, the heavy movement in which their construction has resulted would not be repeated and there is small likelihood that the camps would be continued except on a small scale with the termination of the war.

The practice of heavy troop concentrations within the State of Florida, involving as they do heavy movements of supplies, is generally known. Therefore, our passenger revenues have been greatly improved. During the first eight months of 1940, the Florida East Coast Railway revenue on export and import traffic handled via Port Everglades was only $282,007; for the first eight months of 1941 it was $404,824, while, for the reasons given, during the first eight-month period of 1942, the Florida East Coast freight revenue from export and *and* import via this port was [fol. 4849] $1,234,103.

For many years prior to the present war conditions, the tremendous petroleum products consumption was transported by tank steamers from the ports near the source of supply to Florida ports, and distribution from those ports was for short hauls, for which the railroads involved operated extremely depressed rates.

With the acquisition of the tankers by the Federal Government, as a result of the war activities, considerable impetus in long haul movements of petroleum products was brought about. The Florida East Coast Railway's freight revenue for the first eight months of 1941 produced by petroleum and its products was only $333,186, while for the first eight months of 1942, the freight revenue accruing from the handling of petroleum and its products was $586,144, roughly a quarter million dollar improvement. We have no reason to believe that we could ever hope to control, against the oil companies' ocean tanker service, the volume of gasoline and fuel oil movements to the East Coast

Port Cities where the principal population served by the Florida East Coast Railway is located. These facts deserve careful consideration in connection with the revenue information given by Witness Saunders as to the 1942 period.

Commr. Aitchison: Anything further?

Mr. Gwathmey: That is all from this witness.

[fol. 4850] Commr. Aitchison? Cross examine.

Cross-examination.

By Mr. Hilyer:

Q. Do I correctly understand from your statement it is your position that the Florida East Coast Railway, although now in a prosperous condition, is in a prosperous condition because of war conditions, elimination of border competition, and the increased traffic?

A. That is correct.

Q. And after the war you expect the conditions to return under which your railroad operated at a great disadvantage.

A. Or grow worse.

Q. Your line operates wholly within the State of Florida?

A. Entirely.

Q. And wholly within the strip of coast from Jacksonville to Miami, and south within a few miles of the Atlantic Ocean.

A. Except for a branch line, a 195 mile branch line, yes, sir.

Q. Does the intercoastal canal follow the length of your line from Jacksonville to Miami?

A. It does.

Q. Are there hard surfaced highways directly paralleling your main line?

A. There are.

Q. Do you have competition with the Seaboard Airline Railway from Jacksonville to Palm Beach and Miami?

A. Yes.

[fol. 4851] Q. You have all those competitive conditions to face in normal times, other than in war times?

A. That is true.

Q. In that respect, would you say that the Florida East Coast Railway is in a unique position as compared with other carriers?

A. We feel so, yes, sir.

Mr. Hillyer: That is all.
Commr. Aitchison: Any further cross examination?

(No response.)

Commr. Aitchison: Anything further, Mr. Gwathmey?
Mr. Gwathmey: No.
Commr. Aitchison: You are excused.

(Witness excused.)

Mr. Gwathmey: Mr. Yager, will you take the stand?

J. S. Yager was sworn and testified as follows:

Direct examination.

By Mr. Gwathmey:

Q. Will you give your name, residence, and railroad position?

A. My name is J. S. Yager. I am statistician of the Florida East Coast Railway Company, with headquarters at St. Augustine, Florida.

Q. Have you prepared for the purpose of this case an exhibit together with a written statement in explanation of the [fol. 4852] exhibit?

A. Yes, I have.

Q. Were they distributed at Columbus, Ohio?

A. Yes, sir, at the last hearing at Columbus.

Mr. Gwathmey: Mr. Chairman, following your Honor's suggestion, I will ask that the balance of the statement be copied into the record.

Commr. Aitchison: Is there any objection?

(No response.)

Commr. Aitchison: This may be done. The Exhibit will be numbered 207. Without objection Exhibit 207 is received in evidence.

(Exhibit 207, Witness Yager, received in evidence.)

The Witness: I have been in the service of the Florida East Coast Railway since 1926, previously having had some 19 years experience in railway accounting, valuation, operation, maintenance and statistical departments.

I began my work with the Chicago and Alton Railway at Kansas City, Missouri, during 1908, and, for a period of three years, was employed in the local agency and as chief yard clerk.

I then went with the Santa Fe Railway for two years on general accounts, being transferred to Chicago, where I worked for two years on special statistical studies.

[fol. 4853] I went with the Central of Georgia at Savannah, Georgia, in 1915, where I was employed for a period of 12 years; two years as valuation accountant, two years as traveling auditor, four years as statistician and four years as general yard master, coming to the Florida East Coast Railway in 1926.

During my service with the Florida East Coast I have been engaged continuously in analyzing operating, maintenance and traffic conditions as they exist on this railway system.

It is my purpose to present some facts in rebuttal of Mr. Saunders' Exhibit No. 87 and Mr. Donnell's Exhibit No. 93, and their testimony relating to these exhibits, especially as it applies to conditions existing on the Florida East Coast Railway.

It is obvious that where railroads operate in several states, difficulties in the assignment of revenue and expenses, etc., are presented. The Florida East Coast Railway is strictly a Florida carrier and all of its revenues, expenses and statistics are assigned direct. For this reason, there can be obtained an accurate picture of the Florida peninsula operations from a study of the factors which we will present.

We feel it necessary to offer an explanation in the clarification of Witness Saunders' Exhibit No. 87, dealing with rate of return on the so-called rate-making value as it applies to the conditions existing on the Florida East Coast Railway and particularly then to the figures introduced to [fol. 4854] cover the first seven months of the year 1942.

I will show later that normally, because of the extreme fluctuation in revenues on the Florida East Coast Railway, 52.8 per cent of the freight revenue and 63.6 per cent of the passenger revenue are earned during the first four months of the year. The valley is reached during July, August, September and October, beginning to pick up in November and December.

The method used by Mr. Saunders was to use seven-twelfths of his 1941 value, which spreads over the year equal division of this factor. Obviously this method would not be proper in determining a rate of return to cover the first seven-month period on a carrier under these conditions.

The Florida East Coast Railway has made no provision in the reports so far rendered to the Commission for income taxes which will surely accrue for the year 1942. This is estimated at between one million and a million, five hundred thousand. No consideration of this large and extremely important item was made by Witness Saunders.

The total value of $50,828,894, used by Witness Saunders, has been the subject of protest by the Florida East Coast Railway for many years. The book value of the Florida East Coast Railway as of December 31, 1941, was $85,736,594, which is the value found at date of valuation by the Bureau of Valuation, Interstate Commerce Commission, plus subsequent additions and betterments and working [fol. 4855] capital. It, therefore, can be seen that the value used by Mr. Saunders is only 59.3 per cent of the total investment.

We do not believe the exhibit carries any support to the issues in this case. However, we present the above facts for clarification purposes.

Witness Donnell presented a series of graphs and figures covering sixteen pages, Exhibit No. 93, purporting to show changed conditions within the Peninsula of Florida since the differentials were prescribed and that the disabilities of operation upon which that decision was rendered no longer exist. Those conclusions are far from the facts and I will show that if the proper unit of comparisons was used, the picture is reversed and, on the contrary, the situation is aggravated since the period of 1921 to 1925, which I have used as a base for my comparisons.

Witness Donnell recites his studies of Florida's terrain and climate, the absence of show and ice, etc. I think it is obvious that these conditions have not undergone any change since the arbitrary was prescribed. It is pertinent to mention, and it is well known, that Florida is frequently visited with a severe cold wave which completely destroys the fruit and vegetable crop in various sections of the peninsula. Witness Donnell would have us believe that because of the topographical features, the cost of operations in Florida were favorable as compared with conditions in other states.

[fol. 4856] The Florida East Coast Railway extends along the east coast of the State of Florida south of Latitude 30° north close to sounds or rivers; drainage is imperfect, accompanied by mean annual rainfall of 55 inches. In the Glades section of the Okeechobee Branch, it is not uncommon to suffer from 12 to 20 inches of rainfall within a period of 24 hours, completely inundating the entire section.

The railway is located close to and parallel with and across salt water. The salt atmosphere is extremely harmful to all metals used in construction and operation. In addition, the nearly vertical rays of the summer sun have adverse influence on all paints, more so than in other sections which are not exposed to the constant sunshine and high temperatures and high humidity prevaling in Florida. This condition also slows up laborers and other employees exposed to the extreme heat and humidity.

Marine borrers, such as the teredo, add greatly to the cost of maintaining pile trestles, most of which in the main line are driven in salt or brackish waters, which are more or less infected. Our records indicate an average life of about eleven years out of cr-osoted piling, in specific instances, which is, of course, extremely low in comparison with what is obtained on other roads more favorably located.

Another factor to be considered is the large expense necessary to restore the property after the visit of a tropical storm. This storm damage amounted to an average [fol. 4857] of approximately five hundred thousand dollars per storm for the years 1926, 1928, 1930, and 1935, and our records so show. The storm of September, 1935, wiped out a stretch of about 40 miles of the Key West extension, and caused the abandonment of the line from Florida City to Key West. We do not contend that other sections are entirely void of these storms, but we do know they occur more frequently in the peninsula of Florida than other sections.

I mention these facts to demonstrate in rebuttal of Witness Donnell's conclusions that the absence of grades in Florida denotes relatively lower operating costs, which fact we admit in part; however, we submit that the excessive maintenance costs greatly outweigh any lower operating costs within the peninsula of Florida.

At this point if offer my Exhibit No. 207, which I personally prepared, which consists of ten numbered pages. Page Y-1 is a statement showing the number of employees on the Florida East Coast Railway during the average of the years 1921-1925 and 1937-1941, inclusive, together with the average miles of line operated. The average employees per mile for the period 1921-25 being 6.24 and for the period 1937-41 being 3.81, as contrasted with 2.61 shown by Witness Donnell for the state as a whole.

Comparisons of average employees per line as between states are misleading unless the factors are shown as to [fol. 4858] the method of allocating employees performing system duties.

Statistics of Railways—Interstate Commerce Commission, Year 1940, Table 3, Road owned: Miles by states show 1,320 miles of Class II, Class III and non-operating companies, and 3,898 miles owned by Class I Railways—over 25 per cent of all the mileage in Florida is other than Class I railways.

The month of July was used by Witness Donnell when the traffic handled is at the minimum.

We believe the proper comparisons would be on the number of employees per dollar of railway operating revenue.

I have shown this calculation on the lower section of this schedule and for the prior average years 1921-25, the revenue per employee amounted to $3,784, while then for the average of the latest five-year period, 1937-41, amounted to $3,860. It will be observed that there is practically no change in this condition since the period on which the findings in Docket 13494, prescribing the Florida differential, was based.

Page Y-2 of my exhibit is a statement showing the railway tax accruals (excluding federal taxes) on the Florida East Coast Railway, together with the miles of line owned for the prior period average 1921-25 and for the average of the past five years 1937-41, inclusive. The tax dollars per mile for the prior period being 946 and for the period 1937-1941 were 903, as contrasted to 432 shown by Witness [fol. 4859] Donnell for the year 1939.

We do not subscribe to this method of comparing taxes per mile of line owned, and particularly when taxes per mile are compared by states. There are no standard formulae existing in the various states for determination of value for tax purposes. Florida has one all of its own and 25 per cent of the total mileage is owned by other than Class I railroads. Yard tracks and sidings, together with second main track and all other main tracks are, of course, considered in establishing value of the road owned and the universal method of comparing the unit of taxes is by miles of all tracks owned. This method is employed in the lower section of the schedule and shows an entirely different result.

We submit that the consideration of comparison of taxes is of little value except as to the effect on net income, which I will treat with later.

Page Y-3 is a statement showing the tons of revenue freight carried, together with the tons of revenue freight originated on the Florida East Coast Railway for the period 1921-25, compared with the period 1937-41. I have separated this tonnage to show separately the tons of products of agriculture.

Statement was made by Witness Donnell that "Florida rail traffic has increased 112 per cent since 1921."

The figures shown on page Y-3 of my exhibit do not confirm [fol. 4860] this information from the Florida East Coast Railway standpoint.

During the five years 1921-25 prior to prescribing the Florida differentials, the Florida East Coast Railway carried a total of 13,547,209 tons of revenue freight, while for the past five years 1937-41 the tons carried amounted to only 7,882,696, a decrease of 5,664,513 tons, or 42 per cent.

The witness goes into a recitation of traffic densities in explaining his study. Tons of freight originated nor tons of freight carried have no relation to traffic density. Before taking up the subject of traffic density, I wish to make further comment on this statement with relation to the freight originated where Witness Donnell stated "In freight originated and terminated, Florida has changed from a little state to a big state since 1921."

My exhibit certainly does not confirm this information, but on the contrary, the results are much worse today than they were at the time this feature was studied and the disabilities of the Florida peninsula recognized with the establishing of the existing differential.

During the five years preceding the Docket 13494 decisions, the Florida East Coast Railway originated 1,205,159 tons of products of agriculture, as compared with 1,175,410 during the latest five year period, a decrease of 29,749 tons, or 2.5 per cent.

For total tons of all freight originated during the five [fol. 4861] years preceding the decision, the Florida East Coast Railway originated 7,719,875 tons, as compared with 3,452,546 tons during the latest five year period, a decrease of 4,267,329 tons or 55.3 per cent.

It can, therefore, be seen that this condition has grown relatively worse since the differential was prescribed.

Freight traffic originated on the Florida East Coast Railway is principally agriculture, citrus fruit and vegetables being the leading farm products and constituting 34 per cent of the total tonnage originated as shown by this exhibit.

Page Y-4 of my exhibit is a statement showing traffic density of the Florida East Coast Railway, together with other Class I carriers operating in other differential territories, and totals of regions for the year ending December 31, 1940.

Statement was made that "The traffic density of Florida has shown a commensurately heavy increase over the density obtaining during the course of and prior to the hearings in Docket 13494.".

Page Y-4 was prepared to show conclusively the relatively low traffic density on the Florida East Coast Railway in the peninsula of Florida.

It will be clearly observed that roads operating in other differential territories have a distinct advantage over the Florida East Coast, and in no instance is shown anywhere near the light density as exists on this railway. In prac- [fol. 4862] tically every other differential territory the roads enjoy from two to five times the density that exists on the Florida East Coast Railway. The totals of the regions are even more pronounced than the comparisons with individual differential roads.

The revenue net ton miles per mile of all tracks is shown for the total of the New England region as 617,407, as compared with 282,882 for the Florida East Coast Railway. Stated in another way, the traffic density of the New England region is 218 per cent of the density of the Florida East Coast Railway.

Page Y-5 shows similar information as to traffic density for the year ended December 31, 1928. Unfortunately we did not have available this information for earlier years and have taken only the year at hand to show that there has been no heavy increase in 1940 over the earlier years. We have shown the decrease in tonnage handled over the prior years and can naturally expect a similar showing in the item of traffic density. It will be observed that for the year 1928 the traffic density of the total of the New England region was 244.5 per cent of the density on the Florida East Coast Railway.

Page Y-6 is a graph showing the seasonal fluctation in railway operating revenues (freight, passenger and total) for the average of the period 1921-25, comparing the average of the period 1937-1941.

[fol. 4863] Statement was made by Witness Donnell that "Traffic considered as a whole is not seasonal, but is fairly evenly distributed throughout the year."

This chart shows clearly the uneven distribution of the revenues and the period 1937-41 is more aggravated than was the period studied when the Commission reached its decision in Docket 13494 prescribing the Florida differentials.

The northbound perishable traffic moves during the period of high passenger travel, resulting in greatly distorted distribution during the first quarter of the year.

This chart plainly shows that there exists no even distribution of the railway operating revenues during the year on the Florida East Coast Railway.

Page Y-7 is a graph showing the unbalanced movement of freight traffic by months, January 1, 1937, to December 31, 1941, expressed in per cent of northbound net ton miles to total net ton miles.

It will be observed that the situation explained by Witness Donnell is far from the facts as to conditions existing on the Florida East Coast Railway.

The chart is self-explanatory; however, it is pointed out that the movement of freight net ton miles northbound reaches the peak during the first quarter, then drops to the low of about 10 per cent during the summer months.

This extreme fluctuation and unbalanced flow of traffic on [fol. 4864] the Florida East Coast Railway presents a difficult problem in controlling operating expenses to meet the incoming revenues and consists of one of our greatest disabilities of operation in the peninsula of Florida.

Page Y-8 is a statement showing the tons of revenue freight received from and delivered to connections comparing the Florida East Coast Railway with roads operating in other differential territories for the years ended December 31, 1940-41 and 1928-29.

It will be observed there is complete lack of this overhead tonnage on the Florida East Coast Railway, whereas roads situated in other differential territories do handle a substantial quantity of this overhead tonnage.

The tonnage listed as overhead on the Florida East Coast Railway for the latter years, approximately 3 per cent of the total tons carried consists of sugar and molasses from the Atlantaic Coast Line Railroad at Lake Harbor, Florida. The cane is produced on the Florida East Coast and ground at the mill located on the tracks of the Coast Line at Clewiston. Aside from this movement there is practically no overhead tonnage handled by the Florida East Coast Railway.

Page Y-9 is a statement showing the financial results of operations on the Florida East Coast Railway since the year 1937.

This statement shows the net railway operating income, total fixed charges, deficit under fixed charges, and the rate [fol. 4865] of return earned on the total property investment.

The total property investment consists of the value found by the Commission at the date of valuation, plus subsequent additions and betterments and working capital.

It will be observed that in no year since 1927 has the Florida East Coast Railway been able to earn its fixed charges and during the years 1932, 1933 and 1935 failed to meet the expenses, taxes and rents. Incidentally, these years are subsequent to the prescribing of the Florida differential.

Page Y-10 is a statement showing a comparison of conventional items of operating efficiency, Florida East Coast Railway with roads operating in other differential territories and with totals of different regions.

It will be observed that with respect to operating efficiency the Florida East Coast Railway showing is comparable with other individual roads and with the averages of the different regions.

The commodities handled by the Florida East Coast Railway are light loading and *of* consequence — is necessary to restrict the cars per train to a maximum of 105. For this reason, we are able to obtain only approximately 40 per cent of the engine rating.

Particular attention is directed to the item of per cent loaded to total car miles for the Florida East Coast Railway is shown as 57.8 per cent. This situation clearly shows [fol. 4866] the one way traffic movement on the Florida East Coast Railway.

Mr. Gwathmey: The witness is offered for cross examination.

Commr. Aitchison: Cross examination?

(No response.)

Commr. Aitchison: You are excused.

(Witness excused.)

Mr. Gwathmey: Mr. Chairman, we have one more witness who will be examined by Mr. Abeles.

T. W. Roby was sworn and testified as follows:

Direct examination.

By Mr. Abeles:

Q. Mr. Roby, please state your name and address.

A. T. W. Roby, valuation engineer, Seaboard Air Line Railway, Norfolk, Virginia.

Q. How long have you been employed by the Seaboard and what has been your education and experience?

A. I have been in the employ of the Seaboard for over 28 years or since April, 1914. I have devoted my entire time to valuation work and related matters and since 1918 have had entire charge of all phases of the valuation work.

I am a graduate *in* civil engineer, class of 1904 of the Virginia Military Institute, and a graduate of the Massachusetts Institute of Technology, class of 1907, in civil engineering.

[fol. 4867] From 1907 to 1911 I was in the employ of the McClintic-Marshall Construction Company of Pittsburgh (now a part of the Bethlehem Steel Company) in various capacities, including design, estimating, shop and erection work on steel bridges and buildings, and general contract work applicable to the latter.

From 1912 to 1914 I was employed as designing engineer by Henry Goldmark, consulting engineer of New York City, on design and construction work in remodeling and rebuilding the plant of the Canadian Locomotive Works at Kingston, Ontario, Canada.

Q. Are you familiar with the methods of the Interstate Commerce Commission in preparing elements of value used in determining rate making values, such as cost of reproduction estimates, original cost and present value of land and rights in connection with the Federal valuation of railroads?

A. I am thoroughly informed as to the Commission's past and present practices by virtue of the fact that I have had close contact with its Bureau of Valuation since the inception of valuation work, about 1914, including the field inventory, office calculations, pricing, inventories, the appraisal of land and hearings before the Examiners of the Commission.

I have also had charge of the preparation of returns to the Commission under Valuation Order 3 and other valuation orders reporting changes in units of property and costs thereof subsequent to basic valuation dates.

[fol. 4868] Q. What have you to say with respect to the figure of $189,325,000 as of December 31, 1939, used by Dr. Edwards in this case for the rate making value of the Sea-Board Air Line Railroad?

A. I should first like to state that the Seaboard has not been served with any tentative or final valuation reports of its properties as of December 31, 1939, by the Interstate Commerce Commission as required under Section 19-a of the Transportation Act.

On behalf of the Seaboard, I wish to state that we do not agree with or accept this value figure of $189,325,000 for rate making or any other purposes and we take exceptions to the rules, methods and practices used in its compilation.

Q. In your opinion, is this rate making value of $189,325,000 too low?

A. Yes.

Commr. Aitchison: The rest of this statement and all of the supporting data go to the question that you have just answered, do they not?

The Witness: Yes, sir.

Commr. Aitchison: Any objection to its being copied in?

Mr. Abeles: None at all.

Commr. Aitchison: And to the exhibit being given a number and received?

Mr. Gwathmey: There is an exhibit referred to in the [fol. 4869] testimony.

Commr. Aitchison: That will be referred to as Exhibit 208.

(Exhibit No. 208, Witness Roby, received in evidence.)

By Mr. Abeles:

Q. Why do you reach this conclusion?

A. I cannot, without further review and study of the underlying data, state all of my reasons but the principal ones are that (1) the 1939 "period" prices are too low, (2) too much has been deducted for depreciation, (3) the present value of land and rights is insufficient, (4) the amount included for working capital is exclusive of any cash whatsoever and some of the material and supplies on hand, and (5) the amount added for "going concern" or other elements of value is inadequate.

I should like in this connection to state some facts and make a few observations and comments with respect to the "elements of value" for the Seaboard Air Line Railway System as of December 31, 1939, used by Dr. Edwards in this case.

The "rate making values" and/or "elements of value" for the Seaboard System as of December 31, 1939 (sometimes referred to as January 1, 1940) are identical in (a) Docket No. 28190, New Automobiles in Interstate Commerce (b) Docket No. 28300, Class Rate Investigation and (c) Bureau of Statistics' Statement No. 4142.

The basic or primary valuation of the Seaboard System [fol. 4870] found by the Interstate Commerce Commission as of June 30, 1918, approximately aggregated $131,000,000 as the "rate making value" for total used property. The total value found as of December 31, 1939, is $189,325,000, an increase of $58,325,000.

During this 21½ year period, additions and betterments, including newly constructed and subsequently leased lines, aggregated a gross of approximately $187,300,000, which less retirements of about $69,600,000 makes a net increase of about $117,700,000.

As of January 1, 1937, the Commission, in Ex Parte 123, the 15 per cent Rate Case, found rate making value of

Class I railroads of the Southern Region to be $2,440,000,000 (226 I. C. C. 161), of which the Seaboard's proportion would be about $211,000,000, which is greater by $21,675,000 than the $189,325,000 rate making value as of December 31, 1939, used in this case, notwithstanding the fact that during this three year period the Seaboard expended for additions and betterments a gross of approximately $20,000,000 which was reduced by retirements of about $6,000,000 making a net increase in investment of about $14,000,000.

Q. Have you any comments on the several elements of value you have previous- mentioned?

A. Yes. My review of the valuation figures as found by the Commission for the Seaboard as of December 31, 1939, develops the following:

[fol. 4871] (1) Cost of reproduction new (except land and rights):

Price levels used in making the reproduction estimates underlying the value for the Seaboard System used by Dr. Edwards in this case are far too low not only as of today but even as of December 31, 1939. In support of this conclusion I have prepared a number of charts which I now offer as Exhibit No. 208. Although the charts are largely self-explanatory, I will briefly describe them.

The fifteen charts comprising this exhibit contrast for each of the larger road and equipment accounts the average yearly reproduction price levels of the Bureau of Valuation for the Southern Region during the years 1915-1941, inclusive, with the "Ceriod" price levels as of December 31, 1939, used by the Bureau to determine cost of reproduction new for the Seaboard Air Line Railway System.

The yearly reproduction price levels for the Southern Region, depicted by an irregular line across each chart, were obtained from the pamphlet entitled "Railroad Construction Indices," dated August 1, 1942, and compiled by the Engineering Section of the Bureau of Valuation of the Interstate Commerce Commission.

The 1939 "period" price level on each chart, depicted by a large dot, is the weighted average of the "multipliers" used by the Bureau of Valuation for the lines comprising the Seaboard Air Line Railway System. The price levels [fol. 4872] shown on each chart are constructed on the basis of 1910-1914 as 100, and cover the period from 1915 to 1941, inclusive.

Each chart represents the averages for the items of property involved in that account.

A chart was prepared for each road and equipment account that amounted to over 2 per cent of the total cost of reproduction new of approximately $257,000,000 as of December 31, 1939, for Accounts 1 and 3-77, inclusive.

The accounts for which charts were prepared, listed on Sheet 1 of my Exhibit No. 208, aggregate approximately $230,000,000, or about 90 per cent of the above total.

The Bureau of Valuation in their "Statement of Methods" on page 3, Exhibit A-12, Ex Parte 148, states, "Period prices as of December 31, 0939 have been applied. They are based on a consideration of prices over a period of years."

So far as I am informed, the Interstate Commerce Commission throughout its valuation work has used period prices in determining the cost of reproduction new of railroad property.

The charts in my exhibit No. 208 show that during 1920 there was a sudden and sharp increase in the price level which the Commission in valuation and recapture cases stated was "disregarded as abnormal" (184 I. C. C. 289, 296, 297). There has not been, and indications are that there will not be, the sharp increases of prices during and immediately following the present war as occurred during [fol. 4873] and immediately following the World War I period.

It should be borne in mind in this connection that there are today in effect governmental regulations fixing ceiling prices for the purposes of preventing such abnormal increases as occurred in 1920, and that these ceilings apply directly or indirectly to practically all railroad materials such as lumber, steel, cement, locomotives, cars and machinery. We can, of course, expect, and have experienced substantial increases, but not so abrupt and so great rises as followed the last War.

Certainly, the Bureau price levels of 1939 and the years immediately preceding and following cannot be considered too high and, as just indicated, it would seem that consideration should be given to the higher prices of today in establishing a rate base for use in the immediately future. The charts in Exhibit No. 208, however, clearly show that the period price levels used in 1939 are, with a few exceptions, substantially lower than can be justified by the Bureau's Yearly Price Levels, particularly when the subsequent upward trend during 1940, 1941 and 1942 is taken into consideration. Instead, many of the price levels used by the Bureau apparently reach back into the depression period for support.

My conception of a rate making value as of December 31, 1939, is a value which will reflect as nearly as may be the level of prices over a period of years following December 31, 1939. To determine this future price level is the [fol. 4874] problem, and price levels prior to January 1, 1940, are only of use in so far as these might assist to determine the future price level. In other words, if we knew as of December 31, 1939, that price levels over a reasonable number of subsequent years *was* to be 150 compared to the 1910-1914 level used by the Bureau as a base equal to 100 then, in my opinion, the proper period price level for use as of December 31, 1939, would be 150, regardless of the fact that price levels over a reasonable number of years prior to January 1, 1940, might have been on the 135 level.

While this estimation of the future price level is generally difficult to determine, in this case we know the price levels of 1940, 1941 and for most of 1942 and find them to be for this 2½ year period much higher than the levels prevailing during 1939 and a reasonable number of years prior thereto. A glance at the charts will readily confirm this conclusion.

I draw your special attention to the charts for equipment accounts 51, 52, 53 and 54 and to road accounts 6, 8, 10, 16 and 20 which show that you must go back in most cases as far as 1935 or 1934 to find yearly price levels as low as the Bureau 1939 period price level for the Seaboard.

Q. I notice in the charts shown in your Exhibit No. 208 for Account 3, grading; Account 11, ballast; and Account 12, tracklaying and surfacing, that the Bureau's 1939 period price level is fairly close to their yearly price level [fol. 4875] for 1939, and for several years prior thereto, whereas in the other accounts for which you have prepared charts, the Bureau's 1939 period price level is considerably below, not only the 1939 yearly price level, but is also below the yearly price level for some years prior to 1939. Have you anything to say with respect to this?

A. The charts show that the Bureau's yearly price levels for grading have trended downward from 1920 and that during the years 1938, 1939 and 1940 they are below the 1910-1914 level of prices.

Although I recognize that there have been improvements in grading machinery and explosives since the 1010-1914 period, and that the Bureau's practice is to base its price levels on the relationship of contract prices, it is difficult for me to accept any price trend line which shows the 1939 period level only 4 per cent above the 1010-1914 level.

It is well known that during the past ten years or more very little new railroad mileage has been constructed and, consequently, it seems to me that other things than contract prices would have to be taken into consideration, such as the cost of grading machinery and the price paid for common and skilled labor, all of which have risen far above the 1910-1914 price level.

For instance, the Seaboard paid only from 10 to 12 cents per hour for common labor during the 1910-1914 period while today it pays a base rate of 46 cents per hour. The [fol. 4876] 1917 rate was 12 cents per hour and since that date the rate has progressively increased from 22 cents in 1932 to 27 cents in 1937, 30 cents in 1939, *w*6 cents in March, 1941, 45 cents in September, 1941, and 46 cents in December, 1941.

The average rate paid common labor by the Seaboard during the 1937-1942 period approximates 35 cents per hour or practically treble the average 1910-1914 rate.

The prices for skilled labor and grading machinery have also greatly increased. Furthermore, what few contract grading jobs have been done on the Seaboard in recent years reflect considerably higher prices than the Bureau's 104 price level for 1939. In the light of all these factors the Bureau's 1939 period price level of 104 for Account 3, grading, for the Seaboard seems out of line.

My thoughts in connection with Account 12, which is very largely a labor account, are similar. I have just testified, in connection with Account 3, grading, to the very considerable increase in the price of labor which would necessarily be reflected in the cost of tracklaying and surfacing.

For this account, however, the Bureau's 1939 period price level is 167 and although this is a great deal higher than the Account 3 price level, it still seems too low.

Furthermore, the Seaboard track as of December 31, 1939, is a greatly improved track structure over that existing at June 30, 1918, in that heavier rails have been laid, stone ballast has replaced cinder and gravel ballast to a [fol. 4877] very large extent, and creosoted ties with tie plates have, to a large extent, replaced untreated ties without tie plates.

All of these structural improvements, together with a very much higher degree of maintenance, have produced a track structure of not only a greater carrying capacity, but of greater speed capacity.

For example, in 1918, the generally prevailing maximum speed permitted freight trains on the Seaboard System was 30 miles per hour and for passenger trains 50 miles per hour. Today maximum train speeds have been increased in most instances 50 per cent or more over the 1918 speeds. With a few exceptions the lowest maximum permitted speed for freight trains is now 40, 45 and 50 miles per hour and for passenger trains 65 to as high as 85 miles per hour.

It does not seem to me that these increases in the speed and stability of the track structure could have been given sufficient consideration in determining the 1939 period price level for Account 12, tracklaying.

The Bureau's 1939 period price level for Account 11, ballast, is 144, which does not appear to reflect the increase in prices being paid now and prices paid for some years past by the Seaboard for stone, gravel, slag and other types of ballast, when the cost of haul is taken into consideration.

(2) Cost of reproduction less depreciation:

As of January 1, 1940, for the Seaboard Air Line Railway [fol. 4878] System, the Commission has estimated by the straight line method of depreciation and deducted from reproduction cost about $84,500,000, or 32.88 per cent for depreciation, as compared to a similar deduction of about $41,200,000, or 17.86 per cent as of January 1, 1937.

For road and equipment property, except land, the per cent of cost new, that is the ratio of reproduction cost less depreciation to reproduction cost new, as found by the

Commission for the Seaboard has declined since basic valuation dates as follows:

Ref. No.		*Date*	*Road* %	*Equip.* %	*Total* %
1	Basic Valuation Date	6-30-18	82.23	68.30	79.11
2	Basic Valuation Date (Constructed 1925-27)	12-31-27	94.09	—	94.09
3	Weighted Average (1) + (2)		84.25	68.30	81.17
4	Ex Parte 123 15% Rate Increase	1- 1-37	81.81	83.27	82.14
5	Docket 26459 F.E.C. Ry. Div. Case	1- 1-39	71.01	59.04	67.78
6	Ex Parte 148 Rate Increase Case	1- 1-40	70.53	58.43	67.12
7	Docket 28190 Auto Rate Case	1- 1-40			
8	Docket 28300 Class Rate Invest.	1- 1-40			

[fol. 4879] If, as of January 1, 1940, all of the Seaboard's property other than land (excluding that considered as non-depreciable by the Commission, consisting of Account 1, engineering; Account 3, grading, and salvage) were given a condition of 50 per cent, that is, the service life half gone, the resulting per cent of cost new of all the Seaboard property other than land would be approximately 65 per cent. Thus, it appears that the latest Commission's figures for the Seaboard are equivalent to their finding that the average condition of all Seaboard property which they have depreciated is approximately 50 per cent.

The Commission's condition per cent for Account 8, ties, as of December 31, 1939, was about 52 per cent or approximately the same as that found at valuation date June 30, 1918, notwithstanding the fact that the Seaboard, starting about 1929, has replaced untreated ties in its tracks with treated ties to the extent of about 34 per cent up to December 31, 1939, and has been replacing untreated ties with *un*treated ties of a much better grade and class and, consequently, of a much higher service life. This practice has continued since 1939 and at the end of 1941 the Seaboard had approximately 42 per cent of the ties in track treated ties.

Furthermore, the point of uniform renewal of the present class of untreated ties and treated ties being used in Seaboard track has not been reached and, consequently, I feel that the unexpired service life remaining in the Seaboard [fol. 4880] ties as of December 31, 1939, greatly exceeds the service life remaining in the Seaboard ties as of June 30, 1918, and should produce a much higher condition than the 52 per cent found by the Bureau.

The Commission, as of December 31, 1939, has assigned a condition per cent to Account 11, ballast, of about 15 per cent which is far below the 74 per cent found in 1918 and the normal of 50 per cent condition now generally assigned to this account. This low condition per cent has, of course, been reflected in the final value found.

In fairness to the Commission's Bureau of Valuation it should be said that in bringing valuations to more current dates, we believe the Bureau will increase this condition per cent to at least 50 per cent and perhaps more.

The Bureau took the position in connection with the ballast account that it would exclude from the Seaboard valuation all additions made subsequent to 1927 and further depreciate the ballast in the track as of that date, pending an inventory by the carrier of the ballast in track as of January 1, 1938, to effect the retirement of certain ballast materials not then considered effective and filing by the carrier of a report thereof.

This inventory was made, but due to the large amount of work involved, the carrier was unable to file its report with the Bureau of Valuation until some time in 1941, or subsequent to the date upon which the 1939 figures were compiled.

[fol. 4881] The Seaboard, starting with 1929, has placed additional ballast in its tracks amounting to about 3,500,000 tons exclusive of those amounts placed in the track and charged to maintenance. It is felt that this additional ballast and replacements made justify a condition per cent even exceeding the 50 per cent normally allowed for this account where renewals have become uniform.

As of June 30, 1918, the Commission found for Account 12, tracklaying and surfacing, a condition of about 74 per cent which was reduced to about 62 per cent as of December 3', 1939, notwithstanding the approximately 50 per cent increased speed capacity of the Seaboard's track structure previously referred to in my testimony regarding price levels for this account, and notwithstanding the improved condition of the various items of property comprising its track structure.

In the original Seaboard valuations, the depreciation ascertained and deducted under the Commission's rules was determined after an inspection of the property by their field inventory parties (Texas-Midland ~~Decision~~, 75 I.C.C. 125 and Engineering Board Memorandum No. 226).

The same inspection method was not followed in the 1937 and 1940 valuations, the depreciation deducted being entirely the result of office calculations, although some hurried inspection of terminal facilities and rear-end train observations of some of the more important lines was made. [fol. 4882] The original method gave weight to latest renewals of property or parts thereof in fixing the ages, while the present method frequently does not reflect renewals made through maintenance since valuation date. This refers particularly to facilities made up of short-lived materials such as trestles, fences, signs, platforms, driveways, telegraph and telephone poles and timber docks.

In the original valuations, each structure was separately inspected and depreciated individually, while in the 1937 and 1940 valuations far more general methods were used which did not treat separately with individual items of property.

(3) Original cost (except land and rights):

In determining their 1939 "value" for the Seaboard System, the Commission gave nearly half weight to depreciated original cost, which has been determined by applying to total original cost the same average percentage by which the total cost of reproduction has been depreciated.

The original cost thus depreciated does not reflect the cost of all the property included in cost of reproduction less depreciation which is important in view of the fact that the depreciated original cost of about $160,000,000 is $12,600,000 less than the depreciated cost of reproduction of about $172,600,000.

The cost of treated ties, which have to a large extent replaced untreated ties subsequent to basic valuation date in [fol. 4883] 1918, are not included in original cost. Although under the Commission's Accounting Rules this is correct, it would seem proper that such original cost should be adjusted, at least for valuation purposes, to reflect the increased cost of these treated ties so that the original cost used in determining value may include the same items of property as the cost of reproduction.

(4) Present value of land:

The methods used in appraising lands result in inadequate totals for rate making value for all Seaboard land and in no way reflect present cost of acquisition for railroad purposes. This is illustrated by the fact that for lands which the Seaboard has purchased in later years, the values found are usually far less than what the Seaboard had to pay for such lands to be devoted to common carrier service.

(5) Other values and elements of value:

In the discussion of "Other values or elements of value" in the Texas-Midland Decision there is stated, commencing on page 69, "Going concern value has been described as the value of an assembled and established plant doing business over one not thus advanced."

Analysis of the value for the Seaboard as of January 1, 1940, indicates that there is included not more than 2 per cent of the depreciated value of property other than land and working capital as compared with an average of about 4½ per cent included by the Commission in the basic [fol. 4884] valuation of the Seaboard as of June 30, 1918. There appears to be no justification for this reduction.

(6) Working capital:

No cash is included in working capital for the Seaboard as of December 31, 1939, and only 91 per cent of the approximate $4,000,000 of materials and supplies the Seaboard actually had on hand as of that date has been included as working capital. This improper omission of cash is due to the employment by the Commission of a highly theoretical formula. The failure to allow the materials and supplies the Seaboard actually had on hand December 31, 1939, is said to be due to the exclusion of scrap and materials and supplies for addition and betterment work. The Seaboard has no way of getting a return on the 9 per cent of material stock excluded, except from net railway operating income, and this excluded 9 per cent should, therefore, be included in its rate base.

Commr. Aitchison: Anything further, Mr. Abeles?

Mr. Abeles: Not unless there is cross-examination.

Mr. Bell: I would like to ask one question, if the Chairman please.

Commr. Aitchison: Proceed, Mr. Bell.

Cross-examination.

By Mr. Bell:

Q. Referring to your Exhibit 208 look at the Account 53, that trend line that you call the Bureau's yearly price levels.

[fol. 4885] Is that a result of the indices agreed upon from time to time by the Equipment Committee and the representatives of the Bureau of Valuation?

A. I think so, yes, sir.

Q. And just illustrative of what happened, that dot over there on the right-hand side substantially below the agreed prices indicates the cost of reproduction price figure used by the Bureau as of January 1, 1940, or December 31, 1939?

A. For the Seaboard Air Line Railway.

Mr. Bell: That is all.

Commr. Aitchison: Was this a general agreement or an agreement relating to the Seaboard?

The Witness: No, sir, I am not familiar——

Commr. Aitchison: I asked which.

The Witness: There was a Joint Equipment Committee that negotiates with the Bureau on factual data regarding the cost of equipment.

Commr. Aitchison: But the purport of Mr. Bell's question was that the Bureau of Valuation had gone in the face of an agreement it had made. Was that agreement one which related to the Seaboard or was it general in its terms and related to all of the carriers, or was it merely an average?

The Witness: It was an average that related to all carriers.

Commr. Aitchison: The average, yes, sir.

[fol. 4886] The Witness: That is my understanding. The trend line doesn't explain anything with respect to the Seaboard alone. That is for the southern group of carriers.

Mr. Bell: I had no reference to the Seaboard figure. I was referring to the trend itself as being the result of these indices agreed upon, as I understand it, between the Joint Equipment Committee of the railroads and the representatives of the Bureau of Valuation, just using this account 53 as illustrative.

Commr. Aitchison: Your question would have had more pertinency, it seems to me, Mr. Bell, if you had made a distinction in showing what the Bureau had done in previous years.

Mr. Bell: I am not talking about the Seaboard particularly.

Commr. Aitchison: You did talk about it. You asked a question about it.

Mr. Bell: I wanted to show what that dot meant. My reference respecting the agreement had reference with respect to the trend line.

Redirect examination.

By Mr. Abeles:

Q. From your experience, Mr. Roby, have you any reason to believe that the cost of equipment to the Seaboard is substantially lower than the average cost indicated by this trend line to which Mr. Bell's question referred?

A. No, sir, I have no reason to believe it is lower. They bought from practically the same companies.

[fol. 4887] Q. In other words, is there any sectional influence on the cost of equipment so far as you know?

A. I shouldn't think so. The companies that manufacture are not located in the South.

Mr. Abeles: That is all.

Commr. Aitchison: Exhibit 208 I think has been received. Cross examine. (No response.)

That seems to be all, Mr. Roby. You may be excused.

(Witness excused.)

Mr. Gwathmey: Mr. Chairman, that completes for the time being the testimony we have with respect particularly to the Florida Peninsula.

However, it was understood yesterday, I believe, that Mr. Wolford would be recalled for the purpose of submitting a couple of exhibits relating to the case in general.

May I call him now?

Commr. Aitchison: Very well.

W. W. Wolford, was sworn as a witness and testified as follows:

Direct examination.

Mr. Gwathmey: Mr. Chairman, my attention was directed to the fact this morning that in testifying yesterday Mr. Wolford filed his Exhibit 204 but there was an extra page at the end of the exhibit which was not separately numbered.

Now that other witnesses have testified in the meanwhile [fol. 4888] I would like to ask that that separate page at the end of the bound exhibit be given a number. It would be No. 209, as I recall.

Commr. Aitchison: It will be numbered Exhibit 209.

(Exhibit No. 209, Witness Wolford, marked for identification.)

By Mr. Gwathmey:

Q. Will you proceed, Mr. Wolford, to present the two additional exhibits that you have?

A. Yes. I have an exhibit consisting of three pages showing the rates on glass bottles from Chattanooga, Tennessee, Streator, Illinois, and Charleston, West Virginia, to destinations within Southern territory having a population of 25,000 or more.

The purpose of this exhibit is to show that if the Official territory level of rates should be made available to the manufacturer at Chattanooga the gain that he would obtain in connection with his lower rates into Official territory would be, to the extent shown in this exhibit, offset by a loss in the advantage he now has over his competitors in Official territory in shipping into Southern territory.

The comparison is set out there on the exhibit and I think it needs no further comment.

Mr. Gwathmey: That will be exhibit what?

Commr. Aitchison: Exhibit 210.

(Exhibit No. 210, Witness Wolford, marked for identification.)

[fol. 4889] The Witness: The other exhibit is similar except that it deals with bedroom furniture and mattresses, less carload, from Birmingham, Alabama; Muncie, Indiana; Indianapolis, Indiana, and several other points in Official territory.

The purpose of the exhibit is exactly the same.

Mr. Gwathmey: We ask that these two exhibits be received, Mr. Chairman, and I have no further questions of this witness.

Commr. Aitchison: No further questions?

Mr. Gwathmey: I have no further questions.

Commr. Aitchison: Without objection these exhibits are received, and you may cross examine.

(Exhibits 210 and 211, Witness Wolford, received in evidence.)

Cross-examination.

By Mr. Norman:

Q. Your Exhibit 210, is it, that deals with glass bottles?

A. Yes.

Q. Have you made any investigation to ascertain what would be the effect of rates in the opposite direction made on the same scale?

A. Just what do you mean by the opposite direction?

Q. Well, the rates northbound.

A. That was shown by the witness himself, the rates from Chattanooga into Official territory on his exhibit, of which this is rebuttal.

[fol. 4890] Q. Would not the effect be, taking the two exhibits together, to narrow the competitive disadvantages in both directions?

A. Well, the rates of course from all the points, all competitive points, would be reduced.

Q. And the spread between them would be reduced both northbound and southbound?

A. Yes, I think that would follow in all cases.

Q. So that looking at it from the standpoint of the South, the southern consumer would have a more highly competitive market in which to buy and the southern producer would reach, on a more advantageous competitive relationship, the larger markets in the North?

A. He would reach the larger markets in the North with more ease by reason of the reduced rates and reduced spread, but as the exhibit shows, his competitor in the North would likewise reach his markets with more ease and with less spread over him.

Q. So that commerce would be promoted in both directions?

A. Simply through a reduction in rates for both.

Q. Not only in rates but in rate relationships, wouldn't it?

A. Well, it seems to me that the reduction in rates is the controlling thing and the relationship for each one offsets each other. At least that is the purpose of the exhibit, to show the extent to which they do.

Mr. Norman: That is all.

Commr. Aitchison: Any further cross examination?

[fol. 4891] Mr. Smelker: One question, if the Commissioner please.

Cross-examination.

By Mr. Smelker:

Q. Is there any difference in rates on new and returned furniture or old glass bottles from these points named in your exhibit to Southern territory?

A. I don't recall that there are any rates on the old furniture or old glass bottles.

Q. I will refer to new furniture also, new and returned, or old glass bottles, new and returned furniture.

A. I don't understand your question, then.

Q. I asked if there was any difference in rates between those you have named and those on new and returned furniture or old glass bottles.

A. Well, you say "between," and then you name "new" again.

You are asking if there are any rates between new furniture and new furniture.

Q. I will make it returned furniture, then, or old glass bottles.

A. I still don't know what you are asking.

Q. I will ask the question over.

Is there any difference in the rates on new and returned or old glass bottles from these towns named in your exhibit to Southern territory? I am talking about bottles only, now.

A. You say, "Is there any difference in the rates between new and returned furniture?" Is that the question?

[fol. 4892] Q. Bottles.

A. Or new and returned bottles. So far as I know there are no rates involved here on the returned bottles. I don't know of any. In other words the rates on the new bottles also apply on the old bottles, so far as I know.

Chrmn. Alldredge: I don't think that is what he is driving at.

If these bottles are returned to the factory—I presume that is what he is assuming—shipped out as full containers and then returned as empty containers, do you have any difference in the rates? You do in some instances. Do you have in this instance?

The Witness: I think not.

Mr. Smelker: That is all.

Commr. Aitchison: There seems to be no further cross examination and you are excused.

(Witness excused.)

Mr. Gwathmey: That is all I have, Mr. Chairman. Thank you very much.

Commr. Aitchison: We will now take up the Eastern carriers. Mr. Healy.

Mr. Healy: Mr. Hart has a short statement he desires to present at this time.

William B. Hill, was sworn as a witness and testified as follows:

[fol. 4893] Direct examination.

By Mr. Hart:

Q. Will you give your name, address, and occupation, Mr. Hill?

A. William B. Hill, General Freight Agent, Bangor and Aroostook Railroad Company, the Canadian and Pacific Lines (operating in northern Maine) and the Aroostook Valley Railway operating in northern Maine, a subsidiary?

A. I do.

Q. Have you prepared a statement in behalf of all those lines?

A. I have.

Q. Has that been distributed?

A. Yes, sir.

Q. To counsel?

A. Yes, sir.

Mr. Hart: Mr. Chairman, if it is agreeable to the Commission and to the counsel this may be copied into the record.

Commr. Aitchison: It has been circulated?

Mr. Hart: It has been circulated yesterday.

Commr. Aitchison: Without objection that may be done, if we can have copies here.

Off the record.

(Discussion off the record.)

By Mr. Hart:

Q. This was prepared under your direction and supervision?

A. It was.

[fol. 4894] Q. And it is true and accurate?

A. Yes, sir.

Mr. Hart: Mr. Chairman, we offer that as an exhibit.

Commr. Aitchison: That will be Exhibit 212.

(Exhibit No. 212, Witness Hill, marked for identification.)

Mr. Hart: It relates to the position of the Bangor and Aroostook Railroad Company, the Canadian Pacific Lines, operating in Maine, including its subsidiary, the Aroostook Valley, in these proceedings.

Commr. Aitchison: Anything further?

Mr. Hart: Nothing further.

Commr. Aitchison: Exhibit No. 212 is received.

(Exhibit No. 212, Witness Hill, received in evidence.)

Commr. Aitchison: You may cross examine. (No response.)

If there is no cross examination, Mr. Hill, you are excused.

The Witness: Thank you.

(Witness excused.)

Mr. Healy: I will call Mr. Tannehill.

W. T. TANNEHILL, previously sworn, recalled and testified as follows:

Commr. Aitchison: These exhibits will be marked Exhibits 213 and 214.

Mr. Healy: This exhibit was circulated in Columbus, Ohio, [fol. 4895] and we subsequently found some errors in Sheet 43 and we reproduced it.

Commr. Aitchison: They will be separate exhibits just the same. Exhibit 213 will be the principal exhibit and 214 the correction.

(Exhibits 213 and 214, Witness Tannehill, marked for identification.)

Direct examination.

By Mr. Healy:

Q. Mr. Tannehill, have you prepared an exhibit rebutting certain evidence introduced at the previous hearings in this proceeding?

A. I have.

Q. Is this the exhibit which has been circulated consisting of 51 pages?

A. Yes, sir.

Q. Have you also prepared an exhibit which has been marked No. 214 which is corrected Sheet 43 of Exhibit 213?

A. Yes, sir.

Q. Were these exhibits prepared by you or under your direction?

A. Yes, sir.

Q. Have you prepared a statement dealing with the various aspects of these exhibits?

A. Yes, sir.

Mr. Healy: Mr. Chairman, the exhibit was circulated at the Columbus hearing and the statement of Mr. Tannehill [fol. 4896] was circulated yesterday.

If it is agreeable to you we would like to have the statement copied into the record and I offer the exhibits in evidence.

Commr. Aitchison: Is that satisfactory?

Mr. Norman: Well, I guess so.

Commr. Aitchison: Off the record.

(Discussion off the record.)

Commr. Aitchison: The statement may be copied in, and without objection Exhibits 213 and 214 are received.

(Exhibits 213 and 214, Witness Tannehill, received in evidence.)

The Witness: The first 26 pages of my exhibit portray the action taken during recent years by Official territory carriers upon requests for rate adjustments made by the Southern carriers. Although this is not a complete showing, it illustrates the close cooperation between the Southern and Northern carriers in providing rates to meet the ever changing requirements of commerce.

These pages vary slightly in form, but show the commodity, the origin and destination, the mileage, the rate in effect at the time the proposal was submitted, the rate sought, the rate concurred in by the Official territory lines and the relationship of the latter rate to the Official territory level.

In addition to the commodities listed on pages 1 to 26, inclusive, the Official territory carriers have concurred in [fol. 4897] numerous other adjustments, such as the three thousand odd exceptions ratings from Southern territory to Official territory, which became effective September 1, 1940, and previously referred to at the Indianapolis, Indiana, hearing.

In connection with the revision of the three thousand odd exceptions ratings it should be said that the Official territory lines not only joined in these reductions, but waived the minimum charge provisions at the gateways in order to give the reductions their full effect.

The Official territorry carriers have also approved the establishment of rates on woodpulp from Southern origins on basis of 22½ per cent of I. C. C. Docket 15879 Appendix E Scale from Southern pulp mills to Northern consuming points, which is the present level of rates within Official territory.

Q. Have you reviewed Witness Spottswoood's Exhibit No. 76, and have you comments that you would like to make in connection with this exhibit?

A. I have reviewed the exhibit and have some comments with respect to it.

Turning first to page 11 of Exhibit 76, we find a map purporting to show an inequality in marketing opportunity in the distribution of matches manufactured at Birmingham, Alabama, which is attributed to the present class rate structures.

The witness uses Birmingham, Alabama, and Oswego, New York, as examples, and although the witness conceded [fol. 4898] that there is no production of matches at Birminimum, Alabama, he failed to mention that there is a large production of matches at Barberton, Wadsworth, Cincinnati, Dayton, Piqua, Ohio; Wheeling, West Virginia; Belle Fonte, Pennsylvania; Chicago, Illinois; St. Louis, Missouri, Oshkosh, Wisconsin, and Cloquet, Minnesota. If there were a match concern at Birmingham, these centers of production, rather than Oswego, would constitute its competition to the shaded area on the map.

Witness Maurer, representing Jacksonville, Florida, in his discussion of the competitive situation with respect to the production of matches, Southern Freight Association territory versus Official Classification territory, complained:

"In the meantime and because of our inability to secure prompt relief, the Jacksonville match plant was unable to exist under the handicap in the freight rates to the North and was closed." (Record pages 1840-1843.)

On page 27 of my exhibit is a statement of the first class all-water rates applicable on matches from Jacksonville to North Atlantic Ports, Baltimore, Maryland, to Boston, Massachusetts, inclusive, which were available at the time the plant was closed.

It will be noted that the Jacksonville match manufacturer had rates to this densely populated area in Official territory which were far below the Official territory level. Thus, it is difficult to understand how freight rates can be held [fol. 4899] responsible for the closing of this plant.

Page 12 of Witness Spottswood's Exhibit No. 76 is a map designed to show alleged inequality of marketing opportunity in the distribution of shoes manufactured in the Southwest and uses Boston, Massachusetts and Fort Worth, Texas, as comparative illustrations.

The witness has completely ignored the large production of shoes at Endicott, Johnson City, Binghamton, New York; Columbus, Ohio; Chicago, Illinois; St. Louis, Missouri; Vincennes, Indiana, and Caruthersville, Missouri, which would set the market in this territory if freight rates had any bearing upon the marketing of shoes in the shaded area.

Page 31 of my exhibit is a statement, taken from U. S. Department of Commerce reports, showing the value of boots and shoes (except rubber) produced in the United States for the years 1919, 1929, and 1939.

This statement shows that although there was a general falling off in value of total production, Massachusetts endured a much greater falling off than the country as a whole, while Texas shows an increase both in 1929 and 1939 over 1919.

This page of my exhibit also shows a large production of shoes in or near the shaded area on the map, page 12, of Witness Spottswood's Exhibit 71.

Page 13 of Witness Spottswood's Exhibit No. 76 is a map showing what purports to be a competitive condition [fol. 4900] existing in the manufacture of traveling bags. Here the witness uses Woodbury, New Jersey, and Denver, Colorado, as examples.

According to the luggage and leather goods directory and year book, 1942 edition, published by the Haire Publishing Company, 1170 Broadway, New York, there are 19 manufacturers of luggage in Wisconsin; 64 in Chicago, Illinois; 3 in Iowa; 15 in Missouri; 2 in Minnesota; all located within or adjacent to the shaded area on the map and competitive with the two manufacturers in Denver, Colorado.

Q. Have you any comments to make in connection with page 15 of Witness Spottswood's Exhibit No. 76?

A. Yes. In connection with Item 1, Automobile Storage Batteries. The witness uses Chicago, Illinois, as a producing point, Washington, D. C., as a destination, and Jacksonville, Florida, as the handicapped point. Again the witness ignores the large production of batteries at Philadelphia, Pennsylvania, only 139 miles away.

The witness also uses Newark, New Jersey, as the favored point and Wichita, Kansas, as the handicapped point in marketing at Muncie, Indiana, which is the home of a very large battery producing plant of General Motors.

Item 2, Fresh Beef. The witness uses Buffalo, New York, as the favored producer over Ottumwa, Iowa, in marketing meats at Muncie, Indiana. He ignores the fact that the packing plant at Ottumwa is in the livestock producing [fol. 4901] area, while the Buffalo packers, located several hundred miles east of Muncie, must backhaul the fresh beef they produce from Western livestock on which a much greater transportation charge would apply than to Ottumwa.

Item 3, Boots and Shoes. My comments with respect to page 12 of this exhibit apply equally to this item, bearing in mind that different origins and destinations are used.

Item 4, Milk Bottles. Here the witness uses Toledo, Ohio, and Elmira, New York, as the favored producers and Sapulpa, Oklahoma, and Santa Anna, Texas, as the alleged handicapped producers, the competitive market being St. Louis, Missouri.

In the first place, there are no milk bottles produced at Toledo, Ohio, or Santa Anna, Texas. Secondly, the St. Louis market would be reached by the nearby large production of milk bottles at Streator, Illinois, which is only 197 miles from St. Louis.

Item 5, Domestic Electric Water Heaters. Here the witness uses Pittsburgh, Pennsylvania, and Schenectady, New York, as the favored producers and Chattanooga, Tennessee, and Jefferson, Iowa, as the alleged handicapped producers. The destinations are Peoria, Illinois, and Springfield, Ohio. The several manufacturers of this commodity at Chicago, only 145 miles from Peoria, Illinois, and at Mansfield, Toledo, Cleveland and Dayton, Ohio, only short distances from Springfield, Ohio, are ignored.

[fol. 4902] Item 6, Paints ready-mixed in oil. The witness uses Pittsburgh, Pennsylvania, as the favored producers, and Chattanooga, Tennessee, as the alleged handicapped producer for the Burlington, Iowa, market, again overlooking the large production of paint at Chicago, Illinois, only 206 miles from Burlington.

Item 7, Canned Green Peas. Here the witness uses Manitowoc, Wisconsin, Baltimore, Maryland, and Indianapolis, Indiana, as the favored producers, and Blythesville, Arkansas, Newport, Tennessee, and Marshalltown, Iowa, as the alleged handicapped producers, to the markets at Terre Haute, Indiana, Roanoke, Virginia, and Belvidere, Illinois.

There is a heavy production of peas in southern Indiana adjacent to Terre Haute. According to the United States Department of Commerce, Bureau of Census, 16th Census of the United States, taken in 1940, there was a total pack of peas in Indiana of 421,995 cases.

Belvidere, Illinois, is located in northern Illinois convenient to both the Illinois and Wisconsin canning areas. According to the Department of Commerce, 1940 Census statistics, Illinois packed 1,080,070 cases and Wisconsin packed 4,954,970 cases of green peas. In other words, there is a large production of this commodity immediately to the market shown.

Item 8, Radio receiving sets. Radio receiving sets are produced at many other points much nearer the destinations [fol. 4903] discussed than are Jackson, Michigan; Philadelphia, Pennsylvania, and Rochester, New York. For example, there is a large production at Cincinnati, Ohio, and Chicago, Illinois, much nearer to the consuming markets shown, that is, Knoxville, Tennessee, LaFayette, Indiana, and New Orleans, Louisiana.

Item 10, White Laundry Soap. Here the witness uses Cambridge, Massachusetts; Jersey City, New Jersey; and Chicago, Illinois, as the alleged rate favored producers, and Nashville, Tennessee, as the handicapped producer shipping to Augusta, Georgia, Durham, North Carolina, and Ironton, Ohio.

The witness has overlooked such large producing points of soap as Cincinnati, Ohio and Jeffersonville, Indiana, which, except for Jersey City to Durham, North Carolina, are much nearer to the market shown.

Item 11, Domestic mechanical stokers. The witness uses Chicago, Illinois, as the rate favored producer and Athens, Tennessee, as the rate handicapped producer shipping to the competitive market of Paducah, Kentucky. Much nearer to Paducah are such competitive producing points as Mendota, Illinois, Bradley, Illinois, New Albany, Indiana, and Louisville, Kentucky.

Item 12, Passenger Automobile tires. The witness compares Akron, Ohio, versus Natchez, Mississippi, in shipping to Atchison, Kansas. He completely overlooks tire manufacturing plants at Memphis, Tennessee; Chicago, Illinois, and Des Moines, Iowa.

[fol. 4904] The witness has also compared Conshohocken, Pennsylvania, with Denver, Colorado, in shipping to Peoria, Illinois, but he gave no consideration to the production of tires at Chicago, which is considerably nearer to Peoria than Conshohocken.

Item 15, Domestic electric washers. Here the witness uses Syracuse, New York, versus Manhattan, Kansas, to Indianapolis, Indiana, without considering the heavy production at Peoria, Illinois, only 212 miles from Indianapolis, Indiana.

The witness also uses Pittsburgh, Pennsylvania, versus Houston, Texas, to Omaha, Nebraska, overlooking entirely the production of washing machines at Newton, Iowa, "The Washing Machine City."

Q. Have you any comments to make in connection with page 23 of Witness Spottswood's Exhibit No. 76?

A. Yes. On page 23 rates are shown on cottonseed oil, oleomargarine, cooking or salad oils, in carloads, from Southern origins to Northern destinations. It shows that the rates on cottonseed oil are a little above the Official territory level, while rates on oleomargarine and cooking or salad oils, in carloads, are on a higher relationship to the Official territory level.

Page 28 of my exhibit is a statement taken from the statistical abstracts of the United States, 1941 edition, issued by the Bureau of Census, United States Department of Commerce, and shows the oleomargarine production in [fol. 4905] thousands of pounds from 1917 to 1940, inclusive; for the years 1927 to 1940, inclusive, the production of oleomargarine by States, and for the same four years the material consumed.

From this exhibit it will be noted that there has been a decided decline in the production of oleomargarine in the Northern States.

While there are no Southern States shown specifically in these statistics, under "all other States" it will be noted there has been an increase from nothing in 1937 to 879,000 pounds in 1940.

Under "material consumed" it will be noted that there has been a serious reduction in the consumption of cottonseed oil in the manufacture of oleomargarine, and a large increase in the consumption of soya bean oil.

Despite the fact that Illinois, Indiana, Ohio and Iowa are the largest producing areas of soya beans, the production of oleomargarine in these States has been radically reduced.

Q. Have you any comments to make as to page 24 of Witness Spottswood's Exhibit No. 76?

A. Yes. Page 24 of Exhibit 76 is similar to page 23, using woodpulp as the raw material and newsprint paper as the manufactured article. However, no complaint is made against the rates on woodpulp, pulpboard, paper bags, paper boxes and wrapping paper shown.

As to newsprint paper, the witness complains that the [fol. 4906] rates on newsprint paper from Memphis, Tennessee; Savannah, Georgia; Laurel, Mississippi, and Mobile, Alabama, to northern destinations are 159 per cent of the Official territory level. The witness in his testimony stated that he knew of no production of newsprint paper at these southern origins. To the best of our knowledge newsprint paper is produced at only one point in the South and Southwest, namely, Herty, Texas. Rates are in effect from Herty on basis of 110 per cent of class 25, I. C. C. Docket 15879, Appendix E Scale.

If newsprint paper was produced at the origins shown by the witness, there is every reason to believe that rates would be established from these origins on a similar basis.

Q. Have you anything to say as to that portion of Witness Spottwood's Exhibit No. 76 relative to sweet potato starch?

A. Yes. Pages 16, 35, 36 and 37 involve the level of rates on sweet potato starch from Laurel, Mississippi, to destinations in Official, Southern, Southwestern and Western Trunk Line territories.

We have secured pamphlets published by D. Scrivanish & Co., Philadelphia, Pennsylvania, based on data published by recognized trade journals and officers of the Department of Agriculture, illustrating the use and value of sweet potato starch. It was impossible to secure a sufficient supply of these pamphlets to include them in my exhibit. I do have 25 copies of each for distribution to those particularly interested.

[fol. 4907] Starches are divided into three groups, namely, cereal starch, tuber or root starch, and starches produced from the piths of various palms. Originally, white potato starch was the only domestic root starch. The total production in 1937 was less than 5,000 tons. Sweet potato starch is now grouped with white potato starch. In Official territory, white potato starch is produced only in the Aroostook County potato producing area in Maine.

Cornstarch is the principal starch produced in the United States, but there are definite needs by various industries for other starches which for the most part have been satisfied in the past by imported starches such as those made from cassava and sago.

Apparently sweet potato starch is not competitive with starches produced from cereal grains.

It will be noted from page 35 of Exhibit 76 that the only carload movements of sweet potato starch from Laurel, Mississippi, during the seven months period shown were to destinations in the Carolinas, Knoxville, Tennessee, and destinations in New England and Trunk Line Association territories. The destinations shown would indicate that the starch moved to textile mills, the largest carload movement to Official territory being to Lawrence, Massachusetts.

Page 29 of my exhibit No. 213 is a comparison of rates and mileage on potato starch from Caribou, Maine, to destina- [fol. 4908] tions in Trunk Line Association and New England Freight Association territories, to which carload shipments were made from Laurel, compared with the rates and mileages from Laurel.

It will be noted that the rates from Caribou, Maine to these Official territory destinations ranged from 125 per cent to 147 per cent of the I. C. C. Docket 15879, Appendix E Scale for the distance, while from Laurel, Mississippi, the rates on sweet potato starch to the same destinations are only 103 per cent to 120 per cent of the I. C. C. Docket 15879, Appendix E Scale.

On page 35 of Witness Spottswood's exhibit 76 there is shown movements to destinations in the South and Southwest with a comparison of actual rates and rates under a caption "Official basis." There is no application of the rates carried under the caption "Official basis" to any of the Southern and Southwestern destinations so that such rates are not available to any shipper in Official territory.

Page 30 of my Exhibit No. 213 is a statement of the carload rates on starch from Chicago, Illinois, Indianapolis, Indiana, Columbus, Ohio, and Keokuk, Iowa, to the destinations in Southern territory shown on page 35 of Witness Spottswood's Exhibit 76, compared with the rates on sweet potato starch from Laurel. It will be noted that the rates from all these origins to the Carolina destinations are on a comparable level.

Q. What have you to say concerning the trend of industrial development in the North and the South?

[fol. 4909] A. On pages 31 to 41 of my exhibit we have reproduced figures taken from Government statistics in connection with certain of the commodities which have been previously discussed. The basic figures are taken from Government reports and each page shows the authority for the figures.

Exhiibt No. 79, Witness Fonville.

Q. Have you anything to say in connection with Exhibit No. 79 introduced by Witness Fonville?

A. Yes. Witness Fonville's Exhibit 79 is a statement of the shipments of washboards made by his company from Raleigh, North Carolina, for the month of September, 1941, the charges paid thereon compared with what the charges would be on the Official territory level of rates.

At page 1541 of the transcript, the witness stated that his competition was with a firm maintaining a plant at Saginaw, Michigan, and a branch factory at Memphis, Tennessee, the products of the branch factory being shipped via the Mississippi River at differential rates. His other competitor is located at Columbus, Ohio.

On page 42 and corrected page 43 we have shown the rates and charges paid by the Raleigh, North Carolina, shipper and for comparative purposes what the rates and charges would be if the same shipments had been made from Memphis, Tennessee; Columbus, Ohio, and Saginaw, Michigan. From Memphis, Tennessee, we have shown the Mississippi Valley Barge Line (barge-rail) and the rail-ocean-rail rates [fol. 4910] and charges, as well as the all-rail. We have divided the shipments into three parts, namely:

(1) Destinations in Official territory.
(2) Destinations in Southwestern territory.
(3) Destinations in Southern territory.

From these pages it will be noted that on shipments from Raleigh, North Carolina, to Official territory, the total charges paid were $184.06, while Memphis, Tennessee, with its differential rates via barge-rail, would have paid $239.70.

To all destinations to which shipments were made from Raleigh, North Carolina, in September, 1941, the total charges paid were $342.75, while the shipper at Columbus, Ohio, would have paid $334.42 and the shipper at Saginaw, Michigan, $362.51.

Exhibit No. 83, Witness Edwards.

Q. What have you to say in connection with Exhibit No. 83 introduced by Witness Edwards?

A. This exhibit shows less carload rates on furniture rated 1st, 2nd or 3rd class from Chicago, Illinois, to points in North Carolina compared with rates based on Southern territory level from Witness Edwards' producing point, Birmingham, Alabama.

Page 44 of my exhibit 213 is a statement of 1st, 2nd and 3rd class rates from Chicago, Illinois, as compared with 1st, 2nd and 3rd class rates from Birmingham to the same destinations. It will be noted that there is very little difference between the rates from Chicago and Birmingham to [fol. 4911] these North Carolina destinations.

Attention is called to page 37 of my exhibit, which shows that the value of wood household furniture produced in North Carolina has increased from $23,340,000 in 1921, to $50,224,000 in 1939, while the value of wood household furniture produced in Illinois has decreased from $61,908,000 in 1921, to $37,809,000 in 1939.

Exhibit No. 96, Witness Murray.

Q. Mr. Tannehill, have you anything to say in connection with Witness Murray's Exhibit No. 96?

A. Yes. Pages 14 to 20, inclusive, of Witness Murray's Exhibit 96 contains a list of commodities and among other things, shows what is purported to be the percentage relationship of rates on these commodities to first class in Official territory. There are a number of errors in this part of the exhibit and on pages 50 and 51 of my Exhibit 213 I have shown the correct ratings.

Page 23 of Witness Murray's Exhibit No. 96 sets forth, among other things, the rates purported to be in effect on fibreboard boxes, K. D., carload, from Little Rock, Arkansas; Advance, Louisiana; Sand Springs, Oklahoma, and Dallas, Texas, to a number of Official territory destinations.

Page 45 of my Exhibit 213 shows the correct rates to Official territory points from Advance, Louisiana, and Dallas, [fol. 4912] Texas. We cannot locate in the files of the Official territory associations any requests for rates from Little Rock, Arkansas, or Sand Springs, Oklahoma.

If requests were received, there is no reason to believe that rates from Little Rock, Arkansas, and Sand Springs, Oklahoma, would be treated any differently from those in effect from Advance, Louisiana, and Dallas, Texas.

Pages 26 and 27 of Witness Murray's Exhibit No. 96 compare the level of rates on cotton from Southwestern origins to various destinations, including destinations within Official territory, namely, Boston, Massachusetts; Indianapolis, Indiana, and Columbus, Ohio.

There is no production of cotton in Official territory and the rates in effect from Southwestern origins shown on pages 26 and 27 of Exhibit No. 96 are already lower than the rates prescribed by the Interstate Commerce Commission in the Cotton Investigation, Docket 17,000, Part 3, 165 I. C. C. 595. In other words, any rates applied to cotton moving wholly within Official territory would be in a sense proportional rates, as the cotton would have had a prior movement.

On pages 30 and 31 of Witness Murray's Exhibit No. 96 comparison is made between (1) the rates on lumber from various Southwestern origins to destinations, among which are a number of Official territory destinations, (2) the Official territory level of 22½ per cent of first class, and (3) the [fol. 4913] level of rates prescribed by the Interstate Commerce Commission in 235 I. C. C. 683, of 25 per cent of first class for application in Official territory.

From this exhibit it will be noted that, generally, the rates on lumber from the Southwestern origins shown are considerably lower than the Class 25 and in many instances are lower than the present level of 22½ per cent of I. C. C. Docket 15879, Appendix E Scale, the basis presently applicable within Official Territory.

To complete the showing made in this exhibit on lumber, we have added the Northeastern destinations of Boston, Massachusetts, and Portland, Maine.

Page No. 46 of my Exhibit 213 shows that the rates from the Southwestern origins used are presently lower mile for mile than the Official territory level.

On page No. 32 of Witness Murray's Exhibit No. 96 is shown, among other things, what purports to be the present rates on wrapping paper and paper bags, carload, from Crossett, Arkansas, Advance, Louisiana, and Dallas, Texas, to certain Official territory destinations.

While the witness in his testimony at page 1984 of the record corrected the "A" reference under the rate column, the figures were not corrected, and page 47 of my Exhibit No. 213 shows the correct rates to Official territory destinations.

Page No. 35 of Witness Murray's Exhibit No. 96 compares [fol. 4914] rates on soda ash from Southwestern producing points to points in the Southwest and from Southwestern producing points to Official territory with the Official territory level.

Page No. 48 of my exhibit No. 213 is a comparison of the rates shown on page 35 of Exhibit 96 from Southwestern producing points to destinations in the Southwest with the rates from Official territory producing points to the same Southwestern destinations.

Witness Frye, *Witness* No. 99.

Q. Do you have any comments on Exhibit No. 99 introduced by Witness Frye?

A. Yes. Witness Frye's Exhibit No. 99 compares rates on synthetic rubber from Southwestern points to representative destinations in Official and Southwestern territories.

It was admitted by Witness Frye that in so far as the rates from Baton Rouge, Louisiana, are concerned, the rates on Official territory level have been published; this publication having been made on short notice, effective September 10, 1942.

Q. Mr. Tannehill, in connection with this synthetic rubber situation, have the carriers worked out with the interested shippers a basis for application from all producing points?

A. At the time the Baton Rouge, Louisiana, rates were approved and published, the Official territory lines had no knowledge as to production of synthetic rubber at Dallas, Texas, El Dorado, Arkansas, Oklahoma City, Oklahoma, or other points in the Southwest.

[fol. 4915] However, to complete the record, rates were established, effective January 1, 1943, from all points of production, either presently in operation or contemplated, to consuming points in all territories on basis of 36 per cent of I. C. C. Docket 15879, Appendix E Scale, for the distance.

Witness Byars, Exhibit No. 102.

Q. Mr. Tannehill, have you some remarks regarding Witness Byars' Exhibit No. 102?

A. Witness Byars' Exhibit No. 102, Section A, page 2, compares the rates on carbon gas black in Official territory. This page of my exhibit shows that the only States producing carbon gas black are the States of Louisiana, Texas, Kansas, Oklahoma and Wyoming. It is also interesting to note that in 1923 the production of this commodity in Texas amounted to 2,633,000 pounds, and in 1937 increased to 421,000,000 pounds.

Mr. Healy: The witness is tendered for cross examination.

Chrmn. Alldredge: Have you included some commodity rates in here?

The Witness: Yes, sir.

Cross-examination.

By Mr. Norman:

Q. Mr. Tannehill, isn't it true that with the exception of the raw materials that w-ere you have established rates from the South to the North they are generally on a higher basis than prevail in the North?

[fol. 4916] A. No, sir.

Q. Well, I will ask you to point those that are on a parity basis.

A. The ferro alloys on pages 17 to 26, inclusive.

The blanks, stampings and shapes, unfinished aluminum, on page 16.

Q. Well, unfinished aluminum?

A. To my mind that is far from a raw material. It is a manufactured product.

Q. It is further manufactured after it gets to destination, isn't it?

A. Quite likely; but together, at least.

The synthetic rubber.

Q. Do you consider that not a raw material?

A. Not entirely so, no, sir. Synthetic rubber has a lot of processing.

Q. In connection with the synthetic rubber you have not established any such rates on tires, have you?

A. In some instances. I have none of them here, but I think of quite a number of instances the combinations make even less than our level.

Q. But that is due to the fact the Southern carriers have published a low proportional to the territory boundary, isn't it?

A. Well, and low rates we have from the boundary because of truck competition.

[fol. 4917] Q. But isn't it true now though, Mr. Tannehill, that you all have declined to establish rates on the tires on the parity basis whereas you have established them on the synthetic rubber?

A. No, I don't recall of our lines ever declining to establish that level on tires.

Q. It has never been presented to you?

A. I don't think it has ever been presented to us to my knowledge.

I would like to call your attention also to the fact that leather- from the North Carolina-Tennessee territory on page 8 generally are somewhat lower than our level; equal to, at least.

Q. Do you consider that a raw material or a finished product?

A. As far as leather is concerned, a finished product. It is far beyond the hide.

I would call your attention to the upholstering, fabric, and trimming on page 6.

I would call your attention to the cotton flannels or napped fabric on page 4.

Q. Wait just a second, now. On page 6 you said "fabric."

A. Upholstering and fabric and trimming, carload.

Q. You say that is a finished product?

A. Yes.

Q. All right; go ahead. What was it on page 4?

A. Page 4 is the cotton napped flannels.

[fol. 4918] Q. Well, now you have a heading here, "Rate in effect at time of proposal per 100 pounds except as otherwise provided."

A. That is correct.

Q. Then you have "Rate sought."

A. That is the proposal that was submitted to our lines.

Q. All right; go ahead.

A. Then I would call your attention to page 1, painted, freight, automobile body parts, wooden.

Q. "Freight"? What does that mean?

A. Freight, automobile body parts, wooden, painted. Those rates were established for the specific purpose of permitting the wooden parts for freight automobile bodies to be produced in the South finished, ready to assemble at the northern destination, and they were put in in September 15, 1942, to take care of small industries in the South.

Q. In order to do that there had to be a special proposal which had to be submitted through the panels of the committees and finally approved before those small industries could start producing these?

A. And having handled that particular proposal it was less than 10 days from the time it was originally submitted until it was approved.

Q. That was a war matter, wasn't it?

A. It was a matter of necessity because of the inability to put steel into automobile body parts, and the wood was [fol. 4919] to take the place of it, but nevertheless we had plenty of rates on wooden automobile body parts in the white. These are the painted, ready to be put into the body to be assembled.

Q. Would your lines have any objection to joining in rates made on the same level as obtains in your territory from the South provided the level of the rates in the South was the same as in your territory?

A. If there was a necessity for the rates. That is rather a broad question because rates should be made more or less on what the traffic will bear, if there is necessity for it, and my exhibit shows apparently there was no necessity for rates as low as our level. In all instances the traffic moved freely; to the best of my knowledge it did.

And if the rates were established on our level, the assembly rates within the South should not be on a lower level than ours, and the next question naturally is what our earnings will be out of rates established in that manner.

Q. But assuming that the class rate level is the same in the South as in your territory, would you have any objection to interterritorial rates made on that same level?

A. The class rate level would not cover the assembling articles.

Q. I am not confining this question to assembling. I am confining it to class rates and articles moving on class rates. Suppose they had the same level in both territories?

A. If the commodity moved within the South on the class [fol. 4920] rates, and there was a necessity for it, and our earnings were proper, it has already been testified that we would.

Q. That you would have no objection if the level was the same in both territories to the interterritorial rate being on that?

A. If all the rates were on our level at least.

Q. What do you mean by all of them?

A. You can't take class rate traffic and put that on a level up into our territory and then secure traffic moving on a different level on commodity rates as an exception in the South or in any other territory.

Q. I am talking now about a commodity that moved we will say on first class in Southern territory and first class in your territory and the movement between the two territories on that same level.

A. If there was the necessity for it, and the facts warranted, and we had equal factors of divisions, probably not.

Q. What do you mean by if the facts warranted?

A. The question of whether it is necessary to reduce those rates to that extent.

Commr. McConnaughey: To accomplish what?

The Witness: To move the traffic into the territory, into destination territory.

There is another thing, of course. If that was done we would expect the same level of rates southbound. Rates would have to be the same in both directions.

[fol. 4921] Q. That would be perfectly satisfactory. But you still haven't given me a frank answer to my question, I don't think, and my question is that, assuming that this Commission prescribed for intraterritorial application within the South the same level of class rates that applies in your territory, would you have any objection to the intraterritorial rates then being made on that same level, applicable in both directions?

A. Applicable in both directions, I doubt if we would, and with the divisional question properly settled.

Mr. Norman: That is all.

Commr. Aitchison: Any further questions? (No response.) You are excused.

(Witness excused.)

Mr. Eshelman: Mr. Heywood, will you take the stand?

J. L. Heywood, previously sworn, recalled and testified as follows:

Direct examination.

By Mr. Eshelman:

Q. You have previously been sworn and have testified in these proceedings?

A. I have.

Q. Are you familiar with the testimony of Witness Waring at pages 2904-5 of the record to the effect that it is his position and that of the American Trucking Associations, Inc., that "the present less than carload rates of the railroads obviously are unprofitable and should be increased"?

[fol. 4922] A. I am.

Q. Have you prepared an exhibit showing a comparison of class rate scales in Official Territory with less carload costs based on Dr. Edwards' exhibit?

A. I have.

Q. Is it true and correct to the best of your knowledge and belief?

A. It is.

Q. Has it been distributed?

A. It has.

Mr. Eshelman: Mr. Chairman, if agreeable to the Commission and the parties we would ask that the prepared statement of Mr. Heywood be copied into the record and that the exhibit be received.

Commr. Aitchison: The large exhibit will be marked Exhibit 215, and without objection the statement may be copied in.

(Exhibit No. 215, Witness Heywood, received in evidence.)

Q. Of how many pages does the exhibit consist?

A. On nine pages plus the cover. The first four pages consist of charts and the fifth page shows the bases of costs and class rates used in preparing the charts.

Pages 6 and 7 make comparisons of the costs in the South with the East, respectively including and excluding Pocahontas Region, similar to Mr. Kennedy's Exhibit 181, [fol. 4923] Identification 8, using the unit costs and consist of traffic for the five years, 1937 to 1941, inclusive.

Pages 8 and 9 indicate the derivation of the data shown on pages 6 and 7, lines 14 and 15.

Q. Are you familiar with Dr. Edwards' Exhibit 13, Chart 5, in which he makes a graphic comparison of class rates with less carload costs as developed by him?

A. Yes. In Chart 5 of Exhibit 13, Dr. Edwards presents a graphic comparison of class rates in Official territory, as based upon the Eastern class rate scales, with less carload costs both on a total out-of-pocket basis which includes 4 per cent return on the out-of-pocket portion of valuation and on such a total out-of-pocket basis plus solely related expenses. This he has done for an average load of 6½ tons moving in box cars for Territory No. 2, which is Eastern territory excluding New England and northern Illinois.

Q. In what respects do the charts in your Exhibit No. 215 differ from Dr. Edwards' Chart 5 in Exhibit 13?

A. My exhibit differs in four ways from Dr. Edwards' chart:

(1) I have made comparison for loads of 8, 10 and 12 tons, as well as for 6½ tons.

(2) The costs plotted on my exhibit are for territories 1, 2 and 5 combined. This represents the Eastern territory, including New England and Pocahontas territories.

(3) The charts in my exhibit show out-of-pocket costs [fol. 4924] excluding any return, in addition to showing the two levels of costs shown by Dr. Edwards.

(4) I have also developed these three levels of costs with the inclusion of the expense for pick-up and delivery and allowances to shippers in lieu thereof.

Q. What scales of class rates are depicted on the graphs?

A. The 1st, 2nd, 3rd and 4th class rates resulting from Appendix E scales prescribed in the Eastern Class Rate Investigation (I. C. C. Docket 15879) as in effect just prior to the Ex Parte 148 increases.

Q. Will you state what are the various bases of costs depicted on your exhibit?

A. On each sheet there are three cost lines shown in black. Reading the chart from bottom to top the lowest black line on each sheet represents "out-of-pocket operating expenses, rents, and taxes."

The middle or broken black line represents "total out-of-pocket cost," which differs from the cost first described in that it includes a 4 per cent out-of-pocket return on 100 per cent of equipment value and on 50 per cent of road value. Hereafter for convenience I shall refer to these two levels of costs as "out-of-pocket expenses" and "total out-of-pocket expense," respectively.

The third or dotted black line represents "total out-of-pocket costs and solely related expenses" which consists [fol. 4925] of "total out-of-pocket cost" plus additional elements of constant costs.

Again reading the charts from bottom to top, the first, second, and third red lines correspond to the first, second, and third black lines, respectively, and represent the costs of less carload service on the several bases described including the expense for pick-up and delivery and allowances in lieu thereof.

Q. On what basis do the several costs shown include expense for pick-up and delivery and allowances?

A. The total expense for those items as taken from Table 5 of Exhibit 13 has been divided by the so-called L.C.L. "cwt. carried" as taken from Table 6 of Exhibit 13. The resulting dividend of 7.68 cents per 100 pounds has been added to the several scales of less carload costs as depicted by the black lines on the charts to arrive at those portrayed by the corresponding red lines.

I may add that the item described by Dr. Edwards as "cwt. carried" does not involve any duplication such as do the reported figutes designated as tons carried when the latter are compiled for a region or territory. Dr. Edwards computed L.C.L. "cwt. carried" by dividing less carload tons originated plus tons terminated by 2 to obtain tons and then multiplying the latter by 20 to obtain hundredweights.

Q. Will you please turn to the chart on page 3 covering [fol. 4926] the various costs for a 10 ton load and explain briefly what is shown by this chart as to costs and rates?

A. Reference to chart on page 3 will show that "out-of-pocket expense" and also "total out-of-pocket expense" is below the fourth class rate scale at vurtually all distances.

If pick-up and delivery expense is also included it will be found that on both these levels of cost the expenses are exceeded by the fourth class rate at all distances beyond 70 and 90 miles, respectively. It should be noted that pick-up and delivery in Official territory is subject to a minimum rate of 45 cents so that the revenue in both instances from a fourth class article would exceed these bases of costs.

The line showing total out-of-pocket expenses plus solely related expenses lies generally between third and fourth class rate scale for distances beyond 60 miles and if pick-up and delivery expense is added this expense line lies between the third and fourth class rate scales for distances beyond 140 miles.

Q. Are you informed as to whether the rate scales shown on the graphs apply on New England lines in all instances?

A. I am informed that higher bases of class rates that are shown in the graphs apply to movements within New England territory and to some extent on movements to or from certain northern portions of New England but I have not undertaken to show them on the graphs.

[fol. 4927] Q. Do your charts show the 45-cent minimum rate prescribed in pick-up and delivery in Official territory, 218 I. C. C. 441?

A. Yes, they do. It is represented by a horizontal line at the 45-cent level.

Q. In what respect do your four charts differ?

A. They differ in the load for which the costs are computed. Pages 1, 2, 3, and 4 are computed for loads of 6½, 8, 10, and 12 tons, respectively?

Q. Are the charts otherwise self-explanatory?

A. I think they are.

Q. Will you please further explain pages 6 to 9, inclusive?

A. In order to show results for a recent period, I have restated Witness Kennedy's Exhibit 181, Identification 8, for the five-year period 1937 to 1941, inclusive. These exhibits are based on the elements described in the headings on pages 6 and 7. As will be seen from this exhibit the Southern costs for this five-year period were 98.2 per cent of those for the Eastern District plus Pocahontas Region. On page 7 of this exhibit is a similar comparison but excluding the Pocahontas Region figures. As there appears, the Southern Region costs were 91.3 per cent of the Eastern District costs.

Q. Have you anything to say in connection with the methods followed by Dr. Edwards in his computation of costs as shown in Exhibit 13?

A. Yes. Dr. Edwards developed his out-of-pocket ratios [fol. 4928] for each group of expenses by applying various nation-wide out-of-pocket percentages to the primary expense accounts.

I of course do not agree, and assume that no one would contend that the out-of-pocket proportions of the individual primary expense accounts would necessarily be the same for all groups of railroads, much less for all individual railroads.

In fact, different percentages may obtain on two districts of the same carrier due to a great extent to the physical characteristics of the line, such as grades and curvatures, proportion of main and branch lines, class of train service, way and through trains, peculiarities of yard arrangements, volume of empty cars handled versus loads, type of power used, density of traffic, and other physical factors.

Q. Have you anything further to say in this connection?

A. Yes. In compiling Exhibit 13, Dr. Edwards applied the out-of-pocket ratios for each of the 10 expense groups to the total (or full) expenses for each territory as assigned to the groups in Form A (Exhibit 4) as originally compiled. Therefore, the criticisms in my previous statement of the original cost scales which were predicated on Form A would also apply to the out-of-pocket costs as developed in Exhibit 13.

Q. Mr. Heywood, have you also prepared as a separate sheet an exhibit of corrections to your former testimony at the Indianapolis hearing?

A. I have.

[fol. 4929] Mr. Eshelman: Thinking this would be the shortest way to do it, Mr. Chairman, we offer that as an exhibit.

Mr. Norman: That is the one page?

Mr. Eshelman: That is the single sheet exhibit.

Commr. Aitchison: You know our rules of practice provide a method whereby corrections can be made in the transcript.

Mr. Eshelman: We thought of having him read it in at the other hearing, but you will recall there was too much time taken up that way and you ruled that shouldn't be done in that fashion.

I wanted to receive it in this way but we weren't able to do it within the time limits prescribed by the rules.

Commr. Aitchison: Of course we want the facts. This will be Exhibit 216.

(Exhibit No. 216, Witness Heywood, received in evidence.)

Mr. Eshelman: Mr. Chairman, one other thing. We had not expected to be reached this soon. Mr. Heywood's exhibit was distributed this morning. Mr. Heywood can be available later for cross-examination if any feel that the time has been too short for examination.

Mr. Norman: I never saw it until this moment, Mr. Chairman, and I would like to have some time.

Mr. Eshelman: That is perfectly agreeable to us.

Mr. Grubbs: Will objections to the receipt of the exhibits [fol. 4930] be reserved until after the cross-examination?

Commr. Aitchison: I said without objection they would be received.

Mr. Grubbs: And I arose, your Honor, at that time and Mr. Eshelman asked me to restrain myself for a few minutes.

Commr. Aitchison: You have an objection to make?

Mr. Grubbs: I may have one after cross-examination, yes, sir.

Commr. Aitchison: Very well. I will withdraw the receipt in evidence of Exhibit 215.

(Exhibit 215, Witness Heywood, withdrawn from evidence by Commr. Aitchison.)

Commr. Aitchison: You may stand aside, then.

(Witness excused.)

Fred Carpi was sworn as a witness and testified as follows:

Direct examination.—

By Mr. Eshelman:

Q. Have you prepared a statement of testimony in rebuttal of certain testimony at the Columbus hearing and in supplementation of Mr. Heywood's Exhibit 215?

A. I have.

Q. And in connection therewith have you also prepared an exhibit consisting of two sheets?

A. Yes, sir.

Q. And are these true and correct to the best of your knowledge?

[fol. 4931] Commr. Aitchison: Before you answer that, you better qualify the witness, Mr. Eshelman.

Mr. Eshelman: I beg your pardon.

Q. Mr. Carpi, what is your connection with Pennsylvania Railroad Company?

A. I am Assistant to the General Traffic Manager.

Q. And what length of experience have you had in traffic matters?

A. Since 1929 I have been successively Division Freight Agent, Assistant General Freight Agent, Traffic Manager, General Freight Agent, and my position is Assistant General Traffic Manager.

Q. In connection with your present position have you given considerable time and study to matters particularly concerned with the less carload traffic?

A. Yes, sir, intensive study.

Q. Did you answer the question as to whether your statement of testimony and the exhibit which you have prepared are true and correct?

A. I did.

Mr. Eshelman: Mr. Chairman, we would ask, if there is no objection, that the statement of testimony be copied in as Mr. Carpi's testimony, and that the exhibit be received as the next exhibit. They happen to be stapled together.

Commr. Aitchison: We will have to unstaple them.

[fol. 4932] Mr. Norman: Has that exhibit been distributed?

Mr. Eshelman: I might say, Mr. Chairman, that this exhibit was distributed this morning, we not expecting to get on the stand this early, and I am perfectly agreeable to have Mr. Carpi remain over until tomorrow morning if any wish. I would like to get him away tomorrow afternoon, if possible, as he has to be in Chicago the following day.

Commr. Aitchison: Well, this exhibit has been identified and there will be no ruling on the offer, and without objection the statement may be copied as being his testimony.

(Exhibit No. 217, Witness Carpi marked for identification.)

Statement of Testimony of Mr. Fred Carpi

My testimony will deal in rebuttal with the proposal of Witness Waring, made at the Columbus hearing on his own behalf and on that of the American Trucking Associations, Inc., that the present less than carload rates of the railroads should be increased. In the respect, my testimony will also supplement that by Mr. Heywood in connection with pages 1 to 5 of his Exhibit No. 215.

I (1) As shown by the graphic comparisons in Mr. Heywood's Exhibit No. 215, the less carload rates in Official territory at present are compensatory. This becomes more evident when there is taken into account the distribution of less carload revenue as among the various classes. Sheet [fol. 4933] 1, of my Exhibit No. 217, exemplifies that situation.

It discloses the distribution of less carload revenue by class rate groupings for two test periods in 1925 and 1939, respectively.

It will be observed that in 1939, almost 69 per cent of the revenue was obtained from traffic accorded ratings 65 per cent of first class or higher. This would generally include traffic accorded third class or higher ratings. Over 41 per cent of the revenue during the same period was obtained from rates in excess of 79 per cent of first class, which would generally include traffic rates second class or higher. We have shown the same information for a test period in 1925 to indicate that the higher classes have always contributed the greater proportion of the revenue.

Similar tests made on the Pennsylvania Railroad at different times have shown substantially the same results as those shown in the exhibit for Official territory.

For example, an analysis of local less carload class-rated traffic for the first week of June, 1931, indicated that 48.76 per cent of the revenue was derived from traffic rates second class or higher, and 76.25 per cent from traffic rated third class, Rule 25, or higher.

A similar check for the three days, April 7, 8, 9, 1936, showed that 40.59 per cent of the revenue was derived from traffic rated second class or higher, and 62.17 per cent from [fol. 4934] third class, Rule 25, and higher.

A check made of all less carload class-rated traffic terminated by the Pennsylvania Railroad for the week of September 8-14, 1939, indicated that over 42 per cent of the revenue was obtained from traffic rated second class or higher, and 66.68 per cent from third class, Rule 25, and higher.

The foregoing facts make it abundantly clear that within Official territory the revenues obtained from traffic rated third class and higher constitute substantially more than half of the total less carload revenues.

The traffic analysis made by the A. A. R. Merchandise Committee developed that within Official territory shipments of less carload freight of 10,000 pounds and under moved at an average rate of 72.3 cents per 100 pounds.

The same study disclosed that 43.1 per cent of this tonnage was for hauls under 300 miles, and that 58.8 per cent was for hauls under 400 miles.

The average rate mentioned, as well as the scales of class rates depicted on pages 1 to 4 of Mr. Heywood's exhibit 215 were those in effect prior to the general increase of 6 per cent authorized in Ex Parte No. 148.

Any consideration of the remunerative character of the class rates as applied to less carload traffic should take into account the fact that when pick-up or delivery is rendered there becomes applicable a 45-cent minimum rate, [fol. 4935] which the Interstate Commerce Commission prescribed in Pick-up and Delivery, in Official Territory, 218 I. C. C. 441, and which is portrayed on Mr. Heywood's Exhibit No. 215 as a heavy black horizontal line as the 45-cent level.

If the graphic comparisons contained in Mr. Heywood's Exhibit No. 215 are related to the distribution of less carload revenue as among the several classes, it will be seen that there is no substance for any contention that the present less carload rates are a burden on other traffic.

(2) In considering the remunerativeness of less carload traffic, the common error is to predicate conclusions on antiquated practices and average loadings in the distant past. The only proper test is to take into account results obtained in modern times.

By extensive and expanding use of trucks in gathering and distribution service the railroads have made astounding progress in heavier loading. For example, on the

Pennsylvania Railroad the average loading on less carload traffic at stations has shown remarkable results, as follows:

Year	L.C.L. Average Tons Per car
1933	3.64
1934	4.81
1935	4.93
1936	6.18
[fol. 4936]	
1937	6.63
1938	6.59
1939	6.89
1940	7.08
1941	8.04
1942	10.15
1943 (January)	11.67

I do not have the corresponding loading figures for the Official territory railroads because such figures are not reported to the Commission. However, the O. D. T. makes public the loading results reported to it for Class I roads.

Based upon such figures for October, 1942, as made public in the O. D. T. release of December 15, 1942, I have determined that the average loading for the Official territory roads is close to that of the Pennsylvania.

Thus, for Official territory roads the average loading in that month was 10.61 tons as compared with 11.60 tons for the Pennsylvania alone.

The issuance of General Order O. D. T. No. 1 by the Office of Defense Transportation has undoubtedly spurred the campaign for heavier loading, but, it is submitted that even if this mandatory order had not been issued substantial progress would have continued.

When the Pennsylvania Railroad has completed its program of substituting trucks in gathering and distribution [fol. 4937] service it expects to obtain an average load which in the normal or post-war periods will range from 10 to 13 tons.

The size of the box car is also a factor affecting the average load. Between many points the volume available daily is greater than can be accommodated in one car. As a result "overflow" cars are used. With the tendency towards construction of larger and more spacious equipment the number of overflow cars should diminish and average loadings should be further increased.

(3) Over the years the higher class rates have received greater increases than the rates on the lower classes and the adoption of any proposal to increase the less carload rates would only accentuate this condition.

On Sheet 2 of my exhibit there has been set forth in tabular form an historical statement of class rates from New York to Chicago during the period of January 1, 1915, to March 18, 1942, inclusive.

As will appear therefrom the fifth and sixth class rates, which are usually regarded as carload classes, were on March 18, 1942, just about double what they were on January 1, 1915.

On the other hand, during the same period the first three classes were increased from 75, 65, and 50 cents, to 177, 151, and 124 cents, or 136 per cent, 132 per cent and 148 per cent respectively. Thus, there has been a greater increase both in amount and percentagewise in the higher classes than in [fol. 4938] the lower classes.

As a general proposition, the actual difference in the spread between less carload and carload ratings during the past 30 years has just about doubled.

(4) The practicability of any proposal to increase less carload rates would depend in part upon the value of the service to the shipper. Thus, the railroads are frequently faced with the necessity of making their rates so as to conform in some measure to the charges or costs for which the shippers can obtain the needed service or its equivalent, either by the use of contract or private carriers or by other arrangements.

The greater actual increase in less carload rates than on carload rates has had a tendency to decentralize industry. In order to escape the high less carload rates, some have devised methods of distribution which have deprived the railroads of substantial revenue. Such considerations frequently limit the level of the rates which will permit traffic to move freely.

II. The suggestion on the part of Mr. Waring and the American Trucking Associations, Inc., that the less carload rates of the railroads be increased, and the absence on their part of any concurrent suggestions for a similar increase in carload rates, would seem to contemplate different basic scales for less carload and carload rates. The Official lines are opposed to any such proposal.

The suggestion for separate class rate scales for less [fol. 4939] carload and carload traffic would apparently have to rest upon relatively minor differences in costs and other conditions.

From a practical traffic man's standpoint, a slight or even an appreciable difference in costs cannot be made controlling in the fixation of rates, particularly in scales of class rates where uniformity in structure is desirable for purposes of securing greater simplicity in tariff publication and use.

Separate rate scales for l.c.l. and carload traffic would be burdensome to shipper and carrier alike. One of the main differences between carload and less carload traffic relates to the size of the shipment.

In countless instances, it is necessary for the shipping public and the railroads to ascertain both the less carload and carload rates in order to comply with the long standing classification provision that the charge on the less carload shipment must not exceed the charge based on the carload rate and minimum.

Furthermore, in determining the measure of the carload rate on a particular commodity the less carload rate cannot be ignored and obviously the opposite would be true in determining the measure of the less carload rate. For this purpose it is a convenience to deal with class rate scales on uniform bases and contained in the same tariff tables. Separate scales of less carload class rates would necessarily make such tabulations more complex or require refer- [fol. 4940] ence to other tables or other tariffs.

At best, the rate structure of any territory is complex and this situation has been the subject of continuing efforts over the years both on the part of the carriers and on the part of regulatory bodies, particularly the Interstate Commerce Commission, to obtain a simpler and more readily understood basis of rates. Separate structures of class rates for carload and less carload quantities would introduce an unnecessary and complicating refinement which in the end would serve no practical purpose.

Commr. Aitchison: You may stand aside, subject to further cross examination.

(Witness excused.)

Commr. Aitchison: Whom do we hear next for the Official Lines?

Mr. Healy: That is all we have at this time, Mr. Commissioner, except the printer made a mistake in Exhibit 61. Section 1, Sheet 1, the correct figure is 226.

The exhibit now shows the number of first class carload ratings as 26. The correct figure is 226.

That is all we have at this time, Mr. Chairman. Thank you.

Mr. Bell: May I call Dr. Duncan?

Commr. Aitchison: We will take Dr. Duncan at this time.

Mr. Bell: Dr. Duncan, will you take the stand?

[fol. 4941] Dr. C. S. Duncan, previously sworn, testified as follows:

Direct examination.

Mr. Bell: I may say that Dr. Duncan's statement consisting of a little less than 13 pages was distributed to everybody the first thing this morning.

Commr. Aitchison: Proceed.

By Mr. Bell:

Q. Dr. Duncan, you testified at the Columbus hearing in this case?

A. Yes, sir.

Q. And at the conclusion of the hearing certain work sheets underlying Exhibit 104 introduced by Dr. Frederick of Austin, Texas, were furnished us.

A. After the hearing, yes, sir.

Q. And you have since examined those work sheets and the exhibit and Dr. Frederick's testimony?

A. I have.

Q. Have you prepared a statement, a brief statement, which you would like to orally state on the record in reply to Dr. Frederick?

A. I have.

Q. Will you proceed to give it?

A. In response to a question asked me respecting Dr. Frederick's testimony and Exhibit 104 in this case, I stated in my testimony at the Columbus hearing that I had read [fol. 4942] the transcript of testimony and had examined Exhibit 104 but had not had opportunity to see the work sheets from which this exhibit was compiled. Since the Columbus hearing I have had opportunity to examine these work sheets, which are in five bindings, one each for five Texas industries and set out in Exhibit 104 as follows:

Walker's Austex Chili Company, Austin, Texas, pages 2 and 3.

Brenham Cotton Mills, Inc., Brenham, Texas, page 4.

Superior Products Company, Dallas, Texas, page 5.

Sche-Rose Manufacturing Company, Dallas, Texas, page 6.

Round Rock White Lime Company, Round Rock, Texas, page 7.

I find that the work sheets cover the actual freight bills paid on shipments, both outbound and inbound, from stated origins and destinations.

Q. That is, those were the statements. You haven't been able to check the freight bills?

A. I haven't been able to check the freight bills.

Q. Proceed.

A. There are copious references to tariffs from which calculations have been made as to what the freight charges would have been had the shipments moved under calculated Official territory rates. These figures appear in Exhibit 104.

I have not examined the basis of these calculations, nor has any tariff expert among us had the time which would be required to check the calculations. I am not, therefore, [fol. 4943] in a position to comment on the accuracy of the calculated Official territory rates, except as to one instance. What I shall have to say will deal with other features of the work sheets.

I shall state very briefly the substance of the general and opinion testimony of Dr. Frederick before analyzing the showing of these five industries, called typical of the industries in the Southwestern territory, as set forth in Exhibit 104, in the light of the data revealed in the work sheets.

Dr. Frederick testified that the operations of these five industries are restricted in their activities, in their earnings, or markets by class rate discriminations. (Transcript, page 2105.) He later testified on cross examination that he was not trying to match up the situation of these companies with any competitor at all, that all he was trying to do was to show that here are five concerns in Texas which, due to the rate situation, had to pay more than he thought they should have paid for rail transportation service and that he was not viewing the situation of these industries from the standpoint of competitive markets (transcript, page 2111).

In response to a question as to whether or not Exhibit 104 had been prepared without any consideration whatever for any actual competition, Dr. Frederick stated that what he meant there by "competitive conditions was whether one or the other of these companies might sell more, perhaps in [fol. 4944] another area, if there were lower rates and that such competitive conditions had not been taken into consideration. He said that Exhibit 104 is merely a statement of what these companies did pay (transcript, 2114).

He testified that he was not saying that the freight rate is a deterrent to these people doing business but all he was saying is that, due to the freight rates these people have to pay, they pay too much (transcript, page 2112). Here are his own words:

"All I am saying is that, due to the freight rates these people have to pay, they pay too much. Whether they ship to Mountain Pacific Territory or whether they ship to Southern Territory or whether most of their traffic is within Southwestern Territory is immaterial from the standpoint of the profit and loss statement of the company." (ibid)

Commr. Aitchison: Is it necessary to have this witness testify as to what another witness testified, to the extent of several pages?

Mr. Bell: I think it is important, Mr. Chairman, in order to fully comprehend the significance of what follows. This is a very brief summary of Dr. Frederick's statement.

Commr. Aitchison: It does not seem to be very brief, and it is unnecessary for one witness to testify to what another witness has testified.

Mr. Bell: This is merely——

[fol. 4945] Commr. Aitchison (interposing): The record speaks for itself, Mr. Bell, and I have ruled.

Mr. Bell: What was the ruling?

Commr. Aitchison: The ruling is, it is not proper for Dr. Duncan to give an extensive resume of the testimony of a witness already in the record.

Mr. Bell: Unless I am very much mistaken that has previously been done, but what part of it do you desire copied?

Commr. Aitchison: I don't desire any of it copied. I think it is improper and incompetent for a man to attempt——

Mr. Bell (interposing): This man——

Commr. Aitchison (interposing): Will you permit me to make the record, Mr. Bell?

Mr. Bell: Yes, sir.

Commr. Aitchison: Kindly take your seat until I finish and then I will give you an opportunity to express yourself.

It is improper for a witness to make an extensive statement under oath as part of his testimony as to what he has deduced from the reading of the transcript of the testimony of another witness. The transcript speaks for itself.

Mr. Bell: And he is referring to the pages of the transcript where it can be found, and I submit that in order to fully understand his subsequent analysis of these exhibits and work sheets it is important that this statement be introduced into the record.

[fol. 4946] This man is appearing here as an economist and you have given wide latitude to the others who have testified in like character in this case.

Commr. Aitchison: The testimony with respect to the pages he can cite. He has apparently referred to pages 2001, 2113, 2110, 2122, 2116 and 2123. He can comment on this testimony, but it is not necessary for him to testify what the other man testified to.

Mr. Bell: Where do you desire that we start in this 13-page statement?

Commr. Aitchison: He can begin at the top of page 5, I should say—and also he referred to pages 2105, 2111 and 2114. In fact he has referred to all the pages virtually of Dr. Frederick's statement.

Mr. Bell: I don't see how it is going to reply to a witness without at least giving some idea of what the witness said, and I want to say again it is proper that this go into this record.

Commr. Aitchison: This is a statement of facts he is going to give us.

Mr. Bell: And he is giving you a statement of facts.

Commr. Aitchison: And it is not a debate between the witnesses.

Mr. Bell: It is not a debate. I don't see how we can discuss this exhibit or the work sheets unless we are permitted [fol. 4947] to have this go in, unless we are permitted to state what interpretation the witness put on the exhibit, and that is what we are undertaking to do.

Commr. Aitchison: You are not going to be permitted to state it.

Mr. Bell: Well, I don't know what I can do if I am not going to be permitted to have the witness testify.

Commr. Aitchison: Oh, the witness is going to be permitted to testify, and if you don't know how to examine him I will, and I think I can produce everything that is competent in here, in his statement, and that he will be satisfied with it.

Mr. Bell: Of course I may be extremely ignorant, Mr. Chairman, but I thought I was abiding by rules and the past practice in this case, but I won't pursue the matter further; if you desire to examine the witness I have no objection.

Commr. Aitchison: You can start, if you will, at the top of page 5.

Mr. Bell: May I have permission to have this statement copied into the record without it being read?

Commr. Aitchison: You objected very strenuously to that being done at Columbus.

Mr. Bell: There is no use in stating a part of it if it is going to be chopped in two, Mr. Chairman.

I ask permission to have the statement copied into the record.

[fol. 4948] Commr. Aitchison: Dr. Duncan, in your study of the transcript of the testimony of Dr. Frederick did you deduce anything with respect to his testimony except that is written in black and white in the record already?

The Witness: As to what he said, I deduced nothing, but I did not agree with him, so I don't quite understand the question.

Mr. Bell: May I ask the Doctor a question?

By Mr. Bell:

Q. Dr. Duncan, without stating what Dr. Frederick said how can you state what it is you do not agree with, and you apparently are not permitted to state what Dr. Frederick said?

A. I suppose I can say, Mr. Bell, I do not agree with what he said.

Commr. Aitchison: You can also take up the various matters, can't you, as if Dr. Frederick had never existed or it had been somebody else who testified to it, whose testimony you hadn't read?

Mr. Bell: I think we can shorten it up if you will permit the reporter to copy this statement into the record and let me submit Dr. Duncan for cross examination.

I don't see any use, Mr. Chairman, in busting up halfway a 13-page thing. We boiled it down as much as possible in the hope we could present it orally.

Commr. Aitchison: The ruling has applied to two pages of [fol. 4949] your statement.

Mr. Bell: You have cut out the first five, as I understood you.

Commr. Aitchison: Well, it is more than two, that is right, the first four pages.

Mr. Bell: I don't think it would be intelligible if we are to jump in the middle of it and start with it. So far as I am concerned if you will permit the reporter to copy it as if read, that will be satisfactory.

Commr. Aitchison: If there is any discrepancy between what Dr. Frederick testified and what you swear he testified, is it your testimony that your testimony here is more true as to what he testified to than what he testified to as reported by the reporter?

Mr. Bell: You mistook entirely the purpose of the offer. There isn't any doubt about the accuracy of the statements of Dr. Frederick's testimony, but how we are going to discuss in rebuttal what a man said, without saying what he said, I don't know. I may be ignorant, but may I have it copied into the record?

Mr. Bee: I would like to know what interest it is for Dr. Duncan to say Dr. Frederick he did not represent the industries. What testimony does that take care of to put into this record Dr. Duncan's statement that Dr. Frederick said he didn't represent the industry. If he testified to that it is in the record.

[fol. 4950] Mr. Bell: What are we arguing about? Why not copy it into the record?

Mr. Bee: You have got it here. Why copy it into the record?

Mr. Bell: If we could have gotten it down to six pages we would have done it.

Commr. Aitchison: If you don't think it is necessary for us to hear it——

Mr. Bell (interposing): I would like very much for you to hear it, but I don't want it chopped up so it will be unintelligible, so it might just as well — copied into the record as to have part of it eliminated.

I will tell you what it is——

Commr. Aitchison (interposing): You don't need to do that. This may be copied in.

The Witness: Dr. Frederick testified further that he had made no study of the financial condition of the railroads of Texas or of Southwestern Territory, or of their requirements in the light of the difference between the rates in Official territory and the going rates in Texas and the Southwestern territory, (Tr. p. 2100-1) and that while he had only a very general idea of the financial condition of the railroads in Texas from 1931 to 1940, he thought it was not a healthy one. (Tr. p. 2113. He could not say what would be the reduction in rail rates or to what extent the railroads [fol. 4951] would be deprived of revenues if there were an equality established and the same rates were paid in the Southwest as in Official Territory. (Tr. p. 2110)

Although Dr. Frederick referred to the difference between the total charges actually paid by these Texas industries on inbound and outbound freight and the charges which would have been paid under computed Official Territory rates as an economic burden and, as previously stated, said that no competitive conditions had been taken into consideration, he did testify, in response to a question as to whether he was advocating equality or advocating the Official level of rates, that he was advocating one class rate level, mile for mile, the same in all territories. (Tr. 2122)

It should be pointed out in this connection that the witness does not hold steadfastly to his "economic burden" point of view. As stated above, he wants equality even though it means raising rates in Official Territory. The question was asked of the witness (Tr. p. 2116): "If that difference were eliminated by raising the Official rates to the Texas level, then your basis for saying that these concerns paid too high freight charges would be removed, would it not?" The witness answered: "If we have an equal basis with other parts of the country, that would be so. That is correct." The witness admitted also that if Official Territory [fol. 4952] rates were increased, there would be an increase in the amount of freight charges actually paid by these companies to the extent that they enter Official Territory. (ibid.) The freight charges, of course, would remain the same in Texas, in Southwestern, Southern and Western Trunk Line Territories as now if equality were attained by raising Official Territory rates. The total freight charges would be greater than as shown in Exhibit 104, since there would be an increase in inbound freight charges to every company cited, with one exception, for the reason that Official Territory is the greatest source of inbound traffic and that one company sells 18.3 per cent of its good- in Official Territory.

I may add that Dr. Frederick testified that he did not represent the industries mentioned in Exhibit 104 at these hearings. (Tr. p. 2123)

There seems to me nothing helpful in this kind of reasoning. Either the freight rates in Texas and Southwestern Territory are too high or they are not. They would not be changed except as to the relative position they hold if equality were attained by increasing Official Territory rates and yet, although the witness first states that the believes the charges actually paid are too much, he later expresses the opinion that he would be satisfied if those charges were actually increased, provided it were done by increasing Official Territory rates.

[fol. 4953] As statistical support for his thesis respecting economic burden, Dr. Frederick cited the five companies set out in Exhibit 104, all located in the State of Texas and producing a variety of commodities. It is claimed, as stated, that "these examples in this Exhibit are typical." (Tr. p. 2105) Five examples are certainly very few to be called typical of the industries of the Southwest.

For these five companies, Exhibit 104 shows the amount of goods, in pounds, shipped inbound and outbound, upon which freight rates were paid, also the actual freight charges paid, a per mile rate calculated for the purpose of showing what the freight charges would have been if the inbound and outbound traffic had moved at the computed per mile rate for Official Territory and, finally, the difference between actual freight charges and these calculated freight charges. The difference between the actual and calculated freight charges is called the "economic burden" or disadvantage borne by the Texas industries and this "economic burden" is said to be what inhibits or restricts or handicaps or prevents industrial development in the Southwest. (Tr. pp. 2102, 2105, 2107)

The total of the freight charges on outbound and on inbound traffic and the difference between this total and the mileage computation on Official basis are stated for each of the companies. Both the total freight charges and the dif- [fol. 4954] ferences are compared to net sales, cost of goods sold, capital stock of the company or invested capital and, in some instances, with wages paid, for the purpose of developing a percentage relationship. Thus, the total freight charges actually paid are found to be a certain percentage of net sales or the cost of goods sold, or capital stock and, in the same way, the differences between actual and computed rates are expressed as a percentage of these same factors. As may be readily seen, there is a great variation in these percentages as among the five companies.

There is no information, either in the Exhibit or in the work sheets, on the very important matter of net profits realized from operations by these five companies. There is nowhere a suggestion as to what percentage freight charges should bear either to net sales or cost of goods sold or other factors in the particular industries.

I believe and I shall undertake to demonstrate from information contained in the work sheets that these five industries are not restricted in their activities, earnings or markets.

Walker's Austex Chili Company, Austin, Texas.

The data on this company as contained in the exhibit are shown on pages 2 and 3. It will be noted from page 3 that in 1941 the net sales of this company amounted to $690,578.24. The cost of goods sold was $444,970.01. The capital stock of the company is $200,000. If the books of the company are kept correctly, as one must suppose they [fol. 4955] are, the cost of goods sold includes inbound freight charges and outbound freight charges, since the total amount of freight paid was taken from actual freight bills. For 1941 this company turned over its capital almost three and one-half times and made a gross or operating profit of 35.6 per cent. The actual net profit for the year is not shown nor can it be ascertained from the work sheets, but a gross profit of 35.6 per cent looks like a successful business.

It can easily be demonstrated from Exhibit No. 104 and the work ~~sheets~~ that the distribution, sale and marketing of the products of these Texas industries are over an extended territory and have not been restricted. Referring to the Walker's Austex Chili Company, Austin, Texas, on pages 2 and 3 of the exhibit it will be seen that the outbound products were shipped to southwestern states, including intrastate in Texas, to states in Southern Territory, Official Territory, Western Trunk Line Territory, Mountain-Pacific Territory, and to Canada. These were both less-carload and carload shipments. The inbound shipments which were carload, were from Texas points, Official Territory points, and Mountain-Pacific Territory points. Texas intrastate rates, Mountain-Pacific rates and Canadian rates are not involved in this investigation, although this computation includes amounts in connection with such transportation. [fol. 4956] I generalize here upon this statement. The same situation respecting territories exists in connection with Brenham Cotton Mills, Inc., on page 4, the Superior Products Company on page 5, with the exception of the Canadian traffic, and the Sche-Rose Manufacturing Company on page 6, with the exception of Canadian traffic. Outbound shipments to New Mexico are shown on page 7 covering the Round Rock White Lime Company. However, more detailed information is set out in the work sheets to which I will now refer.

The work sheets for the Walker's Austex Chili Company show that in 1941 this concern sold and shipped its products, consisting of canned food and seasoning, to numerous points in 33 states, with one shipment to Canada. There were about 200 shipments to 57 points intrastate in Texas from this concern at Austin in 1941, for which the total difference in freight charges computed as previously stated, is $372.38. This concern, in 1941, sold and distributed its products to numerous points in the States of Texas, Arkansas, Louisiana, Oklahoma, Alabama, Florida, Georgia, Kentucky, Mississippi, Tennessee, Virginia, Illinois, Indiana, Maryland, Michigan, Ohio, West Virginia, New York, Colorado, Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, Wisconsin, New Mexico, Arizona, Utah, Wyoming, Idaho and California. This Texas company, realizing a gross profit of 35.6 per cent and reaching 33 of the 48 states of the Union, it seems [fol. 4957] to me, can not be said to be suffering from any economic disadvantage. Certainly its distribution has not been restricted. The total freight charges actually paid on inbound and outbound shipments were only 8.5 per cent of net sales. This cannot be called an economic burden in any way restrictive in view of the financial and distribution showing.

Brenham Cotton Mills. The second company treated in the same way is the Brenham Cotton Mills, located at Brenham, Texas. Data are given on page 4 of Exhibit No. 104. It may be noted from these data that 54.1 per cent of the raw materials or inbound traffic comes from Official Territory and Official Territory takes 34.1 per cent of the finished product. The net sales of this company in 1941 amounted to $635,576.45 and the cost of goods sold was $561,743.18. The capital stock was $150,000. There was a capital stock turnover for the year of more than four times. A gross profit of 11.5 per cent was realized in that year. The total freight paid on both inbound and outbound shipments amounted to less than 5 per cent of net sales.

Examination of the work sheets shows that with few exceptions the inbound shipments consisted of textile machinery and apparatus, electric motors, etc., a fact which indicates that the plant was being expanded during 1941. The inbound freight charges on such shipments are of course not representative of ordinary conditions. No less than 40 [fol. 4958] shipments of this character were made from Atlanta, Georgia, and 13 shipments of textile machinery were from Biddeford, Maine. Other shipments were made from Charlotte, North Carolina, from Milford and Boston, Massachusetts. They were all charged into this one year and yet the total cost of freight, inbound and outbound, was less than 5 per cent of net sales.

As shown by the work sheets, the Brenham Cotton Mills, in 1941 sold and distributed its product to numerous points in the State of Texas, and points in the State of Arkansas, Louisiana, Oklahoma, Connecticut, Illinois, Indiana, Maryland, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Florida, Georgia, Kentucky, North Carolina, Tennessee, Colorado, Iowa, Kansas, Minnesota, Missouri, Nebraska, South Dakota, Wisconsin, Arizona, Utah, Wyoming, Oregon, California, and to a point in Canada. There is a total of 32 states of the Union, to numerous points in which this concern distributed its product in 1941. This certainly shows no freight rate barrier or restriction.

Superior Products Company is shown on page 5 of Exhibit No. 104. This company, located in Dallas, Texas, did a considerably larger volume of business than the other companies cited in the exhibit. Net sales in 1941 were $800,364. The cost of goods sold was $503,367. The gross profit was approximately $300,000, or about 37.5 per cent. This includes all freight payments, both inbound and out- [fol. 4959] bound. The capital stock is $50,000 and the turnover for the year 1941 was sixteen times. There is no record of the age of this business but as of 1941 the surplus or undivided profits were about $160,000. From this record the company appears to have done well in the past and to have done very well in the year 1941.

The business of this concern is of a somewhat unique type. It claims to produce 180 different items, among which are toilet preparations, perfumes, furniture polish, paste and ink.

As shown on page 5 of Exhibit No. 104, in 1941, this company produced added value of approximately $300,000 at a labor cost of $8,728. This labor cost is between 9 and 10 per cent of the cost of goods sold and between 6 and 7 per cent of the amount of net sales.

These are very low percentages.

The work sheets show that in 1941 the Superior Products Company sold, shipped and distributed its products to about 455 different points intrastate in the State of Texas and to quite numerous points in the States of Arkansas, Louisiana, Oklahoma, Illinois, Kentucky, Indiana, Michigan, New York, Ohio, West Virginia, Virginia, Colorado, Wyoming, Iowa, Kansas, Missouri, Nebraska, South Dakota, Wisconsin, Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina, Tennessee, New Mexico, Montana, Idaho, Arizona, Utah and California. The sale of the [fol. 4960] products of this company in these 34 states, including the State of Texas, disproves any possible contention that it has been restricted by freight rates or otherwise.

Sche-Rose Manufacturing Company is located in Dallas, Texas. It produces a bread-making compound and ships some chloride of lime. The company is evidently small for, as shown on page 6 of Exhibit No. 104, the total net sales in 1941 were only $26,000. The process of manufacture apparently is simple for wages paid constituted only slightly more than 10 per cent of net sales.

The work sheets show that this concern in 1941 shipped its product to about 70 different points in the State of Texas, the difference in charges on the bases heretofore stated being $377.03. It also shipped its product to points in the states of Oklahoma, Louisiana, Arkansas, Georgia, Florida, Alabama, Mississippi, Michigan, Pennsylvania, Colorado, Iowa, Kansas, New Mexico, Montana and California.

One cannot believe that this is a typical industry. From the meager data given the setup is subject to criticism. For example, in 1941 net sales amount to $26,000, yet office and administrative salaries were $6,500, or 25 per cent of net sales. Wages paid amounted to $2,660, or slightly in excess of 10 per cent of net sales. The capital stock of the company is $25,000, so that the turnover for the year was slightly more than one time. The company is obviously top [fol. 4961] heavy not only with capital stock but with administrative and office salaries. It could pay the entire freight charges of $4,302 on outbound and inbound shipments in 1941 out of these administrative and office salaries and still the relation of these salaries to net sales would not be out of line with other business.

Round Rock White Lime Company is another small company located at Round Rock, Texas, and produces a relatively low value commodity, lime and limestone. As shown on page 7 of the exhibit, the net sales for the year 1939 were $51,118.35, and the capital stock, $90,000. The total weight of outbound shipments was 13,768,420 pounds, and the total actual freight charges on these shipments, $24,044.43. This shows that the average freight rate per ton was slightly less than $3.50. In the column headed "Total Charges When Official Territory Rates Are Applied," the amount is shown as $19,995.41. As previously stated, no check has been made of these charges computed on the so-called Official Territory rate basis, and it cannot be said with certainty what kind of Official Territory rates have been used. However, it is my understanding that only class rates are involved in this case. Page 7 of Exhibit No. 104 shows, as stated, that the total outbound shipments were 13,768,420 pounds. At the estimated Official Territory rate cost of $19,995.41, the rate per ton is $2.90. From this it appears [fol. 4962] evident that Official Territory class rates could not have been used in this computation. As shown by the work sheets, with few exceptions all of this lime moved in carloads. I am not a traffic or a rate man but I am informed by our traffic officials in the Association of American Railroads that this lime does not move on class rates. This instance seems to me to cast some doubt upon the character of rates used in determining the charges alleged to result from application of the Official Territory rate basis in connection with other industries. This and other instances can doubtless be readily checked by the Commission's representatives.

I am, therefore, of the opinion that there is nothing in Exhibit No. 104 or in the work sheets from which it was derived, to support any contention that these industries in Texas are in any way restricted in their markets by freight charges, but that the contrary is true.

[fol. 4963] Chairman Aitchison: Cross-examine.

Mr. Bell: Dr. Duncan is here not only for cross-examination on this testimony he has just given but cross examination of the testimony that he gave at Columbus, in accordance with my agreement with him.

Commr. Aitchison: Any cross-examination, Mr. Smelker?

Mr. Smelker: No cross-exmationation.

Mr. McCarthy: I have one or two questions I would like to ask.

Commr. Aitchison: Proceed, Mr. McCarthy.

Cross-examination:

By Mr. Charles McCarthy:

Q. Doctor, in referring to pages here I am going to refer to the pages in the mimeographed statement which was distributed at the Columbus hearing.

Mr. Bell: You are going to talk about his Columbus testimony?

Mr. McCarthy: That is right.

Mr. Bell: Have you got a copy of your statement there?

The Witness: Yes, sir.

By Mr. McCarthy:

Q. I would first like to refer to page 28 of your statement in which you make the statement that "the lower average annual earnings of workers in the manufacturing industries, especially in the South, but only to a lesser extent of the Southwestern and Trunk Line territories, afford a distinct advantage in lower costs of manufacture as compared [fol. 4964] with Official territory."

Is it your idea, Doctor, that low wages and resulting low standards of living constitute an economic asset of the section?

A. No, sir.

Q. You do not suggest then that these lower standards should be put in effect in Official territory so that Official territory can compete more advantageously with the South?

A. No, sir.

Q. Is it not a fact, Doctor, that low wages are simply symptoms of economic ills?

A. That may be; that may be.

Q. And it is not your idea, is it, that workers in the South accept lower wages simply because they want to help the owners of the business?

A. No, it is not.

Q. Dr. Duncan, in the course of your testimony you referred several times to a pamphlet entitled, "Location of Manufactures 1899-1929," by Dr. Thompson. You have referred to that I believe at pages 16 to 18, page 40 and pages 43 to 45 of your statement.

Do you agree generally with the conclusions reached by Dr. Thompson in that pamphlet?

A. I agree generally with the conclusions to which I have referred here, yes, sir.

Q. You are familiar, I suppose, with the rest of the document?

[fol. 4965] A. Yes, I am familiar with it.

Q. I would like to refer to page 40 of your statement in which you quote from page 47 of Mr. Thompson's statement. The last sentence in that quotation as you have it is as follows:

"The extent to which this has taken place is seen in the narrowing of the extremes in wage jobs per 1,000 population—from 34 in 'other areas' to 124 in the primary area (Official Territory) in 1899 to 45 to 106, respectively, in the two types of regions in 1929."

Do the words "Official Teritory" appear in Mr. Thompson's pamphlet?

A. No, they do not. I think the testimony that I gave explains that I put in those two words.

Q. I see.

A. And that I thought, generally speaking, the outline of the report of Mr. Thompson was in accord with the outline in Official territory, not exactly.

Q. Do you have the report with you?

A. No, I didn't bring it; I am sorry.

Q. I have a copy of it here. I will ask you if that is the report to which you referred?

A. This is the report to which I referred.

Q. Will you turn to page 47 and tell me whether you correctly quoted from Mr. Thompson.

Isn't it a fact that instead of "primary area," Mr. [fol. 4966] Thompson says "primary areas;" that the word is pleural. That is the third full paragraph on page 47, the last sentence.

Mr. Bell: The paragraph ending with "1929," about the middle of page 47.

The Witness: Yes, I see it. I was trying to find the word "areas"—"and in areas of concentration;" is that the one?

Q. I am referring to the last sentence, "The extent to which this has taken place is seen in the narrowing of the extremes in wage jobs per 1,000 population—from 34 in the 'other areas' and 124 in the primary areas in 1899, to 45 and 106, respectively, in the two types of regions in 1929."

A. You are correct; it should be "areas."

I notice another error I noticed before, and that is the fourth word of the quotation it is "the effect of redistributions of industry." It is pleural—"redistributions of industry."

Those are certainly unintentional errors.

Q. I am sure of that, Doctor, but now I want to ask you another question.

Isn't it a fact that the primary areas that Mr. Thompson is talking about are the 97 cities which at that time had a population of 100,00 or more, no matter what territory they are located in, and not Official territory?

A. He referred to both.

[fol. 4967] Q. Isn't it a fact when he uses the term "primary areas" he is referring to the 97 cities having a population of over 100,000?

A. I think that is not correct.

Q. Let me read to you, then, Doctor, beginning the last full paragraph page 46. This is rather an extensive quotation, if the Commission please, but I would like to have it all in the record anyway:

"A type of industrial redistribution essentially different in character from those sectional shifts described above is seen in the changes in the distribution of wage jobs in urban, suburban, and other areas. In *other* to observe such movements data are shown for (a) the 93 cities having 100,000 inhabitants or more, (b) the related industrial areas adjoining these cities, and (c) the remainder of the country —referred to in the report as (a) 'areas of primary concentration,' (b) 'areas of secondary concentration,' and (c) 'all other areas,' respectively. Movement of an industry from one geographic division to another may, of course, indicate a desire to remove from a crowded urban location to one in a suburban or rural neighborhood, but such a regional move is likely to be made primarily in order to take advantage of more convenient supplies of materials, better coverage of the market, or more satisfactory labor conditions. On the other hand, to leave an area of primary concentration for a site in an adjoining secondary area [fol. 4968] usually indicates a desire chiefly for more manufacturing space, lower taxes, etc., in the less congested area. While it not infrequently happens that a plant removes from a primary area of one geographic division to a secondary area of another division in order to gain both kinds of advantages, nevertheless, in general, the two types of relocation are quite distinct in motive and effect.

"Some dispersion of industry is disclosed in the statistics for the areas of concentration. The primary areas, which as a group had about 45 per cent of the nation's factory wage jobs in 1899, did not quite hold that proportion through the following 30 years of rapid industrial expansion, their share having dropped to 44 per cent in 1929. These large urban areas did more than approximately maintain their 1899 share of the country's population. Their portion of that total increased in three decades from 22 to about 30 per cent. In the secondary regions adjoining the large centers industry grew relatively more than it did in the centers themselves, increasing the share of the total wage jobs reported in these outlying areas from 18 to 21 per cent. In all the more industrialized divisions, except the East South Central—six in all—the secondary areas built up their share of the total industry.

"The primary and second areas, in which approximately two-thirds of all factory wage jobs are to be found today, account for only 3 per cent of the land area of the nation. [fol. 4969] The remaining 97 per cent is occupied by what are here termed 'other areas.' Although this vast region suffered a very considerable loss in its share of the total population by reason of the heavy migration to the large cities, it maintained slightly more than one-third of the nation's industry with but a small loss in percentage.

"A group of 287 manufacturing plants in the largest 50 cities, those reported as relocated in 1928 or 1929, reflected so strong a tendency toward decentralization as to suggest the possibility that data, if available, might indicate a recently increasing momentum away from the largest urban centers. The movements of these plants brought decided gains in wage jobs to the 'other areas,' and lesser, but nevertheless real gains to the regions of secondary concentration."

Now, Doctor, then comes your quotation on page 40. In the light of what went before do you still contend that primary areas means Official territory or were you mistaken in your use of it?

A. No. As I said before, and as you have read into the record, I think quite clearly he discusses both the items you have in mind, the concentration of industry in the large cities and in the general areas, and I have demonstrated later from the figures Mr. Thompson showed that the basis of this conclusion is found in the statistical data which it gathered.

Q. Doctor, I am not questioning the fact that in the course [fol. 4970] of this report he has discussed the two types of distribution which you have mentioned, but my question is whether or not when Mr. Thompson uses the term "primary areas" here he means Official territory or whether he is talking about the 97 cities having a population of 100,000 or more?

A. My judgment is that he is talking about the area of concentration and not the cities alone.

Q. Does he use the term "primary areas" as meaning Official territory, or doesn't he? That is a question which can have a yes or no answer.

A. In my judgment he does, yes, practically speaking.

Mr. McCarthy: Very well; that is all.

I would like to introduce, in behalf of the Tennessee Valley Authority, two short quotations from the report of Mr. Thompson. Shall I simply mark them and hand them to the reporter or should they be read into the record?

Commr. Aitchison: Off the record.

(Discussion off the record.)

Mr. Bell: I object to those quotations from that document. I don't know what they are, but I have no objection to anybody referring to the entire book.

Mr. McCarthy: If I recall the record correctly, when Dr. Duncan put in certain quotations from this the Commission ruled that any other party could introduce any other parts of the report.

[fol. 4971] There are several other quotations in the course of that statement.

Commr. Aitchison: As I understand it you took certain data from this brochure and used it as part of your testimony.

The Witness: As part of an exhibit I put in.

Commr. Aitchison: Which was introduced as a part of your testimony.

The Witness: Yes, sir.

Mr. McCollester: May I see the two paragraphs?

Mr. McCarthy: Surely. It is the first full paragraph on page 9 and the last one on page 48.

Mr. Bell: I thought at that time, Mr. Chairman, it was understood, and I believe you so stated, that anyone was at liberty to refer to the entire document. I suppose that still stands if he wants to use part of it in his brief, but why copy a couple of quotations from the entire book out of the general context? We may be required to put in the whole thing.

Commr. Aitchison: He is entitled to put in any portion of it he wants to, not necessarily the whole thing.

That is covered by our rule of practice.

Mr. McCarthy: Then I offer in evidence the first full paragraph on page 9 entitled, "Sectional Shifts," and the last paragraph on page 48. Would the Commission care to have me read that into the record?

[fol. 4972] Commr. Aitchison: You might as well read it or let the reporter copy it.

Mr. Wagner: I also have about a dozen sentences in that document I would like to have copied into the record. I have marked my copy and the reporter can copy them.

Mr. Bell: I would like to know what they are. I don't have a copy of this thing.

Mr. McCarthy: I have marked these quotations.

Mr. Bell: Well, may I be shown the courtesy of seeing a copy of what you propose to introduce?

Mr. McCarthy: I am sorry; pages 9 and 48.

Mr. Bell: May I have a few moments recess to go over this thing with Dr. Duncan and find out what parts we want copied in the record?

Commr. Aitchison: Is there objection to this offer?

Mr. Bell: Yes, I objected to it.

Commr. Aitchison: On what ground?

Mr. Bell: Because they can refer to the entire document.

Commr. Aitchison: Oh, no.

Mr. Bell: And I see no reason for cluttering up the record.

Commr. Aitchison: The Rule of Practice 80 covers it.

Mr. Bell: I am sorry.

Commr. Aitchison: "Unless it is desired to read such matter into the record, and the officer so directs, true copies [fol. 4973] in proper form of the material and relevant matter taken from the document may be received as an exhibit, but other parties shall be afforded an opportunity to introduce in evidence, in like manner, other portions of such document if found to be material and relevant."

I understand it was read into the record, the portion that Dr. Duncan referred to, but other parties should be afforded an opportunity to introduce in evidence in like manner other portions of such document if found to be material and relevant. The document itself will not be received, so they may offer in like manner, reading into the record just as Dr. Duncan did.

Mr. Bell: Do you want him to read this document into the record?

Commr. Aitchison: He has asked that that be done.

Mr. Bell: Then may I check it to see what else goes into the record?

Commr. Aitchison: Oh, yes. You may have that opportunity. The hearing isn't closed.

Mr. Bell: Is this the time it is being introduced as part of Dr. Duncan's cross-examination?

Commr. Aitchison: These two paragraphs are.

Mr. Bell: With the understanding that I likewise can read the book into the record after I examine what he puts in.

Mark the copy that goes in so we can examine it and find what you are putting in.

[fol. 4974] Mr. McCarthy: Page 9, the first full paragraph:

"Sectional Shifts.—While there has been a lively interest in the growth of industry in the South and West, the fact remains that only the East North Central division has been able thus far to challenge seriously the historical industrial supremacy of the manufacturing East, composed of the New England and Middle Atlantic divisions (Table 3). In these three divisions occurred the major part of the sectional redistribution of industry which took place from 1899 to 1929. Together they reported 75 per cent of all factory wage jobs at the beginning of the century and 70.2 per cent 13 years later. The combined share for New England and the three States of the Middle Atlantic division dropped from 52.2 to 41.4 per cent of the total for the country. While considerable growth, as measured by rate of increase, took place in the six other divisions as a group, their total increase in wage jobs during the 13-year period was less than that for the single East North Central division."

Mr. McCollester: I would like to have, in connection with that paragraph, the immediately following paragraph.

Commr. Aitchison: You can put it in.

Mr. McCollester: I thought it might be more convenient to have it all together.

Commr. Aitchison: Mr. McCollester is offering the following paragraph.

[fol. 4975] Mr. McCarthy: All right; this is a very short one. I don't mind him putting it in here.

Mr. McCollester: "At each Census from 1899 to 1929, wage jobs, expressed as a percentage of the total for the United States, exceeded the corresponding percentate of population only in the New England, the Middle Atlantic, and the East North Central divisions. In these three highly industrialized divisions changes in the industry proportions were considerable as compared with those in population. A pronounced decrease in the percentage of wage jobs in the Middle Atlantic division accompanied a small increase in its proportion of the total population. In the East North Central division the opposite change took place, a slight decrease in its population percentage being accompanied by a large increase in its percentage of wage jobs. On the principal industrial frontiers—South Atlantic, East South Central, West South Central, and Pacific—the percentage of the total wage jobs increased, but only in the westernmost two of these divisions did corresponding changes take place in population."

Commr. Aitchison: You may continue, Mr. McCarthy.

Mr. McCarthy: Page 48, the last paragraph:

"This brief study has dealt only in a broad way with the subject of the location of manufactures since the beginning of the century. Practically no consideration has been given to the forces which have brought about industrial migration [fol. 4976] and determined location, although some quantitative measurement of those influences could possibly be made from data collected by the several divisions of the Bureau of the Census and from other business and statistical organizations. Nor has the subject of the probable economic and social consequences of further decentralization of industry found a place in this primarily descriptive study."

Mr. Bell: Now, what is the question?

Mr. McCarthy: That is all.

Mr. Bell: May I have an opportunity of looking this book over with Dr. Duncan and deciding what we want to put in, if anything?

Commr. Aitchison: Anything further of Dr. Duncan at this time?

Mr. Bell: Not at this time. We desire the privilege of recalling him if we want to put some more of this book in.

Commr. McConnaughey: Doctor, what do you consider the primary reason for the moving of industry in the last 10 years away from the so-called primary larger industrial centers?

The Witness: I consider these factors, in order: The rights of men of energy and vision, the climatic conditions, the availability of labor, and the availability of raw materials.

Commr. McConnaughey: The prime, fundamental reason for industrial leaving?

The Witness: Those are the reasons in the order as I [fol. 4977] would give them.

Chrmn. Alldredge: Doesn't congestion of human beings generally develop certain antidotes by the mere process of congestion?

The Witness: I think that is true, yes.

Chrmn. Alldredge: It is a combination of circumstances really, isn't it, that causes people to disperse from unduly congested areas?

The Witness: Not a single force, obviously not. That is why I gave him several.

Chrmn. Alldredge: Even failure to find parking space, if it becomes monotonous, might become an element, wouldn't it?

The Witness: In moving an industry, if you mean that, no.

Chrmn. Alldredge: Moving people out.

The Witness: Not monotony of trying to find a parking space.

Commr. McConnaughey: In the last 10 years you wouldn't consider labor the fundamental, primary reason for industry moving from the larger cities?

The Witness: The order in which I gave you the forces before are my best judgment. Labor is nothing unless management wants to use it. It has got to arouse that management first, in my opinion.

Mr. Bell: Are you through, Mr. Commissioner?

Chrmn. Alldredge: I started to pursue it, but I won't.

[fol. 4978] Commr. Aitchison: Arouse them to what?

The Witness: Organize them. Organize them and use them.

Commr. Aitchison: You don't give us anywhere in the statement the factor, in the process of relocation, proximity to markets where the product is distributed, if I recall correctly.

The Witness: No, it is in there.

Commr. Aitchison: Where?

The Witness: Always nearness to market. I have discussed that among the factors.

Commr. Aitchison: Well, I caught it as being a division of management, climatic conditions, availability of men, and availability of raw material. Where would availability of market come in that category—if I caught them correctly?

The Witness: I just mean in what I answered the Commissioner here it follows what I have said. My point in the previous testimony was to a considerable extent devoted to this one thesis that these factors which I have enumerated of management, climatic —, labor, raw materials, are stronger factors in determining the location of an industry than nearness to market.

Commr. Aitchison: You put that as a fifth factor?

The Witness: I put that after these others. In some cases there may be another factor.

Commr. Aitchison: What is that?

The Witness: Even such a factor as availability of water [fol. 4979] for the manufacturing process.

Commr. Aitchison: That is availability of raw material, isn't it?

The Witness: No, not the raw material in making the product.

Commr. Aitchison: You wouldn't consider water was raw material, then?

The Witness: Not in the making of any product.

Chrmn. Alldredge: I thought Commissioner McConnaughey asked you for your opinion as to the dispersion of industry from congested areas, and not the attraction of industry to other areas.

The Witness: My understanding of the inquiry, and the record shows, it shows what I thought was the primary factors in the dispersion of industry from a concentrated area.

Commr. McConnaughey: Quite right.

The Witness: Which meant I assumed the industrial advantage. Maybe I was mistaken.

Chrmn: Alldredge: But when it comes to dispersion of industry from congested areas then don't other factors enter the equation, such as the disadvantages of living and conducting business generally, that happen every day?

The Witness: If by dispersion——

Chrmn. Alldredge (interposing): Moving out from a congested area to one which is not congested.

[fol. 4980] The Witness: What you have in mind, you mean the same thing was brought up in all these quotations here; you are right; but that is decentralization of a concentrated urban area, not a sectional group as we were discussing.

Commr. McConnaughey: That is true.

Commr. Aitchison: Anything further?

Mr. Bell: One question, Doctor.

Redirect examination.

By Mr. Bell:

Q. Reference was made to lower wages in the South. Connected with that state whether or not there is a lower living cost in the South.

A. The costs of living are lower in the South than in the East.

Q. So that the purchasing value of the wage earner's dollar may be no substantially different. Isn't that right?

A. That is true.

Commr. Scott: How late does that statement vouch for?

Mr. Bell: Did you say "late"?

Commr. Scott: Yes.

Mr. Bell: You mean downward?

Commr. Scott: Yes.

Mr. Bell: These are extremely abnormal times now.

The Witness: The last figures I saw were for July, 1942.

By Mr. Bell:

Q. Doctor, briefly stated, in your examination of the work sheets underlying Exhibit 104 state whether or not you found that these concerns mentioned in there were distribu- [fol. 4981] ting their products in 34 or 35 States of the Union, and some of them in Canada?

A. That is true.

Q. Was there any indication whatever from the work sheets of a restriction in the markets of these Texas concerns used by Dr. Frederick in his Exhibit 104?

Commr. Aitchison: Isn't that all covered by what is to be copied in?

Mr. Bell: I thought I expressed a desire to have you hear just that part. That is all.

Recross-examination.

By Mr. Bee:

Q. May I ask the Doctor did you find that all those companies were sending to 33 or 34 States?

A. No.

Q. Did you find any of those companies were sending a material part of their output to 33 or 34 States?

A. Yes.

Q. Didn't you find in some instances that only 250 or 260 pounds a year moved to certain States?

Mr. Bell: All of the details are in his statement.

Mr. Bee: Please, will you let the witness answer, Mr. Bell, and not you.

A. As I recall, a small amount, 253 pounds went to Canada.

Q. Yes, sir, and didn't you find like amounts to some of the States?

[fol. 4982] A. Yes, relatively small amounts.

Q. How long did you have Dr. Frederick's work sheets?

A. I?

Q. Yes, sir.

A. A day and a half, I think.

Q. Do you know how long they were in possession of the counsel for the railroads?

A. I wouldn't know that.

Q. If they were in the counsels' possession for more than three months don't you think there was sufficient time to have checked some of the rates if you thought there was anything wrong with any of the rates that Dr. Frederick used?

A. Well, we are pretty busy people.

Q. May I ask you to go to page 7?

A. Of the statement?

Q. Of your statement.

A. Yes.

Q. You say, "If the books of the company are kept correctly, as one must suppose they are, the cost of goods sold includes inbound freight charges and outbound freight charges, since the total amount of freight paid was taken from actual freight bills."

Don't you know that none of the companies in the cost of goods sold include the outbound freight charges?

A. Prepaid freight charges, they ought to.

[fol. 4983] Q. If they are prepaid they may be included?

A. Yes.

Q. But when a man goes to ascertain the cost of his goods and he wouldn't know the destination of his sales, how can he ascertain his freight charges to include them as cost of the goods?

Mr. Bell: I might call your attention to the fact that Exhibit 104 includes both freight charges.

Mr. Bee: It does not say so.

Mr. Bell: Yes, it does, inbound and outbound.

Mr. Bee: There is nothing in the exhibit that makes that statement, Mr. Bell, and the exhibit speaks for itself.

Mr. Bell: I have got it right here.

Mr. Bee: So have I.

Commr. Aitchison: You have got a question that hasn't been answered.

Mr. Bell: Yes, sir.

By Mr. Bee:

Q. I asked, Doctor, how are we going to ascertain the cost of freight charges in figuring the cost of goods when you don't know where your destination is?

A. My understanding is that the freight rates set down here were obtained from freight bills.

Q. Is there anything in Dr. Frederick's statement that shows that he has included both inbound and outbound freight charges in the cost of goods sold?

Your counsel makes the statement definitely that that is [fol. 4984] in the exhibit.

Mr. Bell: I said both inbound and outbound freight charges are shown in the Exhibit 104 as stated to be the ones paid by the concern and compared to what it would have paid had it moved — classification rates.

Mr. Bee: No. Where does it say "paid by the concern"? You put words into the exhibit that do not appear there, Mr. Bell. If you will let the exhibit speak for itself it will be better.

Commr. Aitchison: Apparently there is no necessity for answering your question.

Mr. Bell: All right.

Commr. Aitchison: Anything further, Mr. Bee?

Mr. Bee: That is all.

Commr. Aitchison: Any other cross-examination?

Mr. McCarthy: I have one further question.

Recross-examination.

By Mr. McCarthy:

Q. Dr. Duncan, you say the cost of living is less in the South. Could you tell us about how much less, what the percentage is?

A. I thought I had brought the figures to which I referred along with me, but I do not find them here, so I wouldn't care to answer from recollection.

Q. Are they substantially less?

A. Yes, they are substantially less.

[fol. 4985] Q. Are you familiar with the study of the Bureau of Labor Statistics which covers the estimated cost of living for a four person manual worker's family at maintenance level in 33 large cities as of September 15, 1942?

A. Yes, I have seen that.

Q. Isn't it a fact that except for New York and Washington and to a much lesser degree Cleveland and Detroit, that the figures show only slightly lower costs in the South than in the North?

Commr. Aitchison: That is not the way to get those figures in.

A. I haven't the figures, if it is permissible, that I have copied from the document to which he is referring.

Commr. Aitchison: How long will this cross-examination be?

Mr. McCarthy: I have just one more question if I could ask that.

Commr. Aitchison: All right.

Q. I would like to know, Doctor, whether for instance that report shows that the cost of living in Baltimore was $1,566.34 and in Memphis $1,567.03?

Commr. Aitchison: You are going clear outside the cross-examination. You brought this thing in, this report, that you have got in your hand there and then proceeded to cross-examine him on it by asking first if he knows about it.

Mr. McCarthy: He stated he is familiar with it.

[fol. 4986] Commr. Aitchison: Well, I am familiar with lots of things that aren't so, but that doesn't entitle them to be put in evidence.

The Witness: I don't know whether those figures are correct or not.

Q. You don't know whether those figures are correct or not?

A. No.

Mr. Bell: I have always said that there is one noticeable thing about these commerce cases, you learn so many things that weren't so.

Commr. Aitchison: Doctor, you are excused subject to recall.

The Witness: Thank you.

(Witness excused.)

Commr. Aitchison: We will suspend until 2 o'clock.

(Whereupon, at 12:30 o'clock p. m., a recess was taken until 2 o'clock p. m.)

[fol. 4987] AFTERNOON SESSION 2 p. m.

Commr. Aitchison: Proceed.

Mr. Bell: Mr. Chairman, I merely desire to read a few lines of this printed publication which conclude the two paragraphs mentioned by counsel for the TVA and followed by Mr. McCollester. What I wish to read completes the last paragraph.

"In the East—" This is on page 9 of this document—"In the East North Central Division the opposite change took place, a slight decrease in its population percentage being accompanied by a large increase in its percentage of wage jobs. Of the principal industrial frontiers, South Atlantic, East South Central, West South Central and Pacific, the percentage of the total wage jobs increased, but only in the westernmost two of these divisions did corresponding changes take place in population."

That is all that we desire to add to what has already been said.

Mr. Wagner: If the Commission please, I have several sentences that I would like to get into the record, but I believe that the parties are willing to agree that anyone may refer to any portion of this document on brief, and if so, why that would relieve the record to that extent.

Commr. Aitchison: Well, that doesn't leave us with a very good record. In the event you have to make up a record, you better put it in.

[fol. 4988] Mr. Wagner: If the Commission please, may I leave with the reporter the portion I want to be copied in the record?

Commr. Aitchison: Have you shown it to counsel?

Mr. Wagner: Counsel has had my marked pages during the noon recess.

Mr. Bell: He has, but we better make these marks a little more definite.

Mr. Wagner: My marks are the two perpendicular lines beyond the lines——

Commr. Aitchison: Off the record.

(Discussion off the record.)

Commr. Aitchison: Anything further, Mr. Bell, or Mr. Wagner?

Mr. Bell: No, I think not, if there is no further cross-examination of Dr. Duncan. I regret very much that I did not get the presentation made orally, because I think it would have been quite interesting and shown quite a distribution and no restriction of market.

Mr. Taylor: I will call Mr. Hamilton. Mr. Hamilton has not been sworn, Mr. Examiner.

L. S. Hamilton, was sworn as a witness and testified as follows:

Direct examination:

Mr. Taylor: May we have his exhibit numbered, Mr. Commissioner?

[fol. 4989] Commr. Aitchison: Exhibit No. 218.

(Exhibit No. 218, Witness Hamilton, marked for identification.)

By Mr. Taylor:

Q. Please state your full name.

A. My name is L. S. Hamilton.

Q. Where do you reside, Mr. Hamilton?

A. My address is 516 West Jackson Boulevard, Chicago.

Q. By whom are you employed?

A. Chicago, Milwaukee, St. Paul & Pacific Railroad Company.

Q. I will show you the exhibit identified as 218 and ask you whether or not this exhibit was prepared by you or under your direction.

A. It was.

Mr. Taylor: We offer Exhibit 218 in evidence.

Commr. Aitchison: Without objection it may be received.

(Exhibit No. 218, Witness Hamilton, received in evidence.)

Mr. Taylor: Mr. Chairman, the testimony of this witness and the exhibit were distributed yesterday, and his qualifications and explanations of the exhibit are in the statement. Now, if there is no objection we are perfectly willing that it be copied into the record.

Commr. Aitchison: All right? Any objection?

Testimony of L. S. Hamilton on Behalf of Western Trunk Line Railroads

My name is L. S. Hamilton. My address is 516 W. [fol. 4990] Jackson Boulevard, Chicago, Illinois. I am Assistant General Freight Agent for the Chicago, Milwaukee, St. Paul and Pacific Railroad Company (Henry A. Scandrett, Walter J. Cummings, George I. Height, Trustees). I have been connected with the Traffic Department of the Milwaukee Road since 1919. My first position was Rate Clerk and, later, Chief Clerk in office of the Division Freight Agent, which I occupied for approximately five years; then Chief Clerk to Assistant General Freight Agent, Chicago, for two years; then Chief Clerk to the Assistant Freight Traffic Manager in charge of rates and divisions, Chicago, for seven years; Chief Clerk to Freight Traffic Manager, Chicago, until appointed Assistant General Freight Agent in November, 1940, having supervision of rates on local traffic, also interchange traffic, within Illinois Rate Committee territory, and issuance and distribution of tariffs. Since August, 1941, I have been engaged in preparation of evidence and testimony in connection with freight rate cases before the Interstate Commerce Commission and various State Commissions in the territory east of the Missouri River.

I have been called as a witness in this proceeding on behalf of the railroads operating in Western Trunk Line territory to offer testimony in rebuttal of claims made by witnesses representing commercial interests in Western Trunk Line territory at the Columbus hearing. While the claims of these witnesses for a change in the class rate struc- [fol. 4991] ture to and from the cities or territories they represent were not in every case identical, they were akin to the extent that these witnesses expressed the opinion they should have a lower scale of rates than now exists, not only within the zone in which they are located, but, as well, between their particular area and Official territory.

Witness Tharp initially testified on behalf of the railroads operating in Western territory and expressed the position of those railroads that the existing territorial spreads in rates should not, at this time, be altered.

Witness Townsend expressed the opinion that the Official territory scale of class rates should be extended into the Twin Cities and Southeastern Minnesota on and east of the line of the Omaha Railroad, Minneapolis to the Iowa-Minnesota State Line. Witness Smith of Duluth concurred in *that expression and the extension of the Official scale of* rates to Duluth and stated that he had no objection to extension of the rates to the Minnesota-North Dakota border and to the Missouri River, south.

Witness Sundberg for Iowa does not favor any territorial groupings for the class rate adjustment but expressed the opinion that if there are to be boundaries set up, they might properly be at the Missouri River, the effect of his testimony being that the entire State of Iowa should be included in the Official territory class rate zone.

[fol. 4992] Witness Smith, Waterloo, Iowa, expressed the belief that the inter-territorial class rates between Iowa and Official territory should not exceed those within Official territory, and that between the South and Iowa, the class rate level should not exceed that which may be prescribed between the South and Official territory.

Witness Real, Topeka, Kansas, wants the boundary of Zone 1 pushed westward so that Topeka will be in Zone 1 instead of Zone 2 as at present and that whatever basis of rates may be prescribed as a result of this proceeding for the present Zone 1, be applied within the territory he described on page 1, Section 2 of Exhibit No. 117.

Witness Dyer of Wichita, Kansas prefers a uniform scale throughout the territory involved in this proceeding, but in event that does not come about, he would reroute the Western boundary of Western Trunk Line Zone 2 to include Wichita, and further, if the suggestion of Witness Real of Topeka should result in Zone 1 being extended westward to include Topeka, then the Zone 1 boundary should be rerouted in order to include Wichita.

The principal contention of the Minnesota and Iowa witnesses, which I have heretofore mentioned, for broadening of the Official rate territory to include a part of Minnesota and all of Iowa, is that the industries in those states are in competition with industries in Official territory [fol. 4993] and that consequently they should have the same basis of rates. The witnesses from Topeka and Wichita stressed principally the competition with other cities located in zones further east, particularly Missouri River points located in Zone 1.

While I did not participate in the Western Trunk Line Class Rate Investigation, I. C. C. 17,000, Part 2, nor in the Consolidated Southwestern Cases, I. C. C. 13,535, it is my understanding from review of the reports of the Commission in those proceedings that the contentions of these witnesses are not new and appear to be almost identical with those put forth by witnesses representing the same areas in the proceedings mentioned.

My exhibit has been prepared for the purpose of showing that conditions have not changed since the various zones and rate relationships were established as result of the decisions in the Western Class Rate Investigation, I. C. C. 17,000 Part 2, 164 I. C. C. 1 and 204 I. C. C. 595, sufficiently to justify remaking of zones or any leveling of the class rates. Since this investigation involves class rates only, the exhibit is designed to indicate to the Commission conditions that influence the measure of rates on traffic of that nature within and between the existing zones in W. T. L. territory, and between that territory and Official and Illinois territory.

It will be noted in this exhibit that under Value of Manufactures as reported in the Census of Manufactures that [fol. 4994] certain cities or portsions of the territories are marked with an "x" which indicates that nothing was published because to have done so would reveal the actual or approximate business of some individual enterprise in the city or county. Under these circumstances, we have included in the exhibit all of the available information. This has a tendency to understate the total value of manufactures for any group of cities or portions of territory involved in the exhibit. The extent of the understatement cannot, of course, be determined.

The breakdown of the Value of Manufactures by counties in each of the Zone 1, 2 and 3 States eliminates the amount of undistributed value of manufactures not shown by counties but is included in the value for the State. This tends to decrease the value of manufactures by zones in W. T. L. territory when compared with C. F. A., where values for States of Illinois, Indiana and Ohio have been used in total.

The proportion of undistributed value of manufactures for 1939 to total for each of the W. T. L. territory States used is as follows:

W.T.L. State	Total Value of Manufactures	Undistributed	Ratio to Total
Kansas	$464,353,506	$13,365,306	2.88
Missouri	1,388,056,267	78,120,511	5.63
Nebraska	273,524,581	3,214,417	1.18
Wisconsin	1,604,507,356		
[fol. 4995]			
Minnesota	845,771,514	102,697,945	12.14
Iowa	718,531,801		
North Dakota	43,767,082	4,274,097	9.77
South Dakota	81,171,887	8,579,546	10.57
Total	5,419,683,994	210,251,822	3.88

Class rates have been designed and most generally do apply to consumers' goods and to commodities that have reached a final stage or near to a final state of completion; therefore, such rates are applicable to what we term "high-class traffic." The volume of traffic of that description that may move within, or, from and to a particular area, is necessarily influenced by the extent to which the commodities may be consumed or produced within that area, and the density of population, to a very large extent, controls. A different situation may and often does exist in respect to raw products on which commodity rates generally apply. Those products, such as grain, coal, lumber and others that move in great volume, may be produced in areas where the population is exceedingly thin, and the density of the population, therefore, has little bearing on the volume. These matters always have been and should be taken into consideration in making rates; and, as far back as the history of class rates goes, major consideration has been given to factors that offer information as to the actual or potential volume of traffic. The Commission recognized differences existing in [fol. 4996] transportation conditions within W.T.L. territory in I.C.C. 17,000 Part 2 Investigation, 164 I.C.C. Pages 198 and 199. Also that Illinois territory was more akin to

Official territory as to transportation conditions, including those parts of Wisconsin in Illinois territory, 164 I.C.C 211.

Volume 164 I.C.C. 208, affords access to the solution that the Commission reached on the problem of fusing the inter-territorial rates, and indicates the recognition given to the different transportation conditions as between Official territory, including Illinois territory, as described in that report, and Western Trunk Line territory, as had been recognized in respect to different levels of rates and the fusing of those rates within and between Zones 1, 2 and 3 in W.T.L. territory.

Pages 1 and 2 of my exhibit offer a comparison of the population growth and the value of manufactures between certain cities in Central Freight Association territory and Western Trunk Line territory. The cities named were chosen as representative of the territories in which they are located, and it will be observed that for the cities located in Central Freight Association territory, the total increase in population, 1940 over 1930, was one per cent. For the cities located in Western Trunk Line territory, named on page 2, the increase in population during the same period was 4.8 per cent, indicating that the freight class rate struc- [fol. 4997] ture did not, during that period, retard the growth of those cities as compared with the cities in the alleged more favored area. It will be observed from line 10, page 2, that the population of the Twin City area had an increase of 6.2 per cent which would seem to be an answer to the allegation by Witness Townsend that there has been a loss of industries to that community because of the freight rate adjustment. The population of an urban area would not likely increase if its industries were being drawn away. The same may be said of Des Moines, Iowa and Cedar Rapids, Iowa, lines 11 and 12 of the same page. As proof of a much greater production of manufactures in respect to population in Central Freight Association territory versus Western Trunk Line territory, attention is called to the column "Value Per 1000 of Population—1933 and 1939", pages 1 and 2. Additional data on those pages shows the much greater importance of manufacture in Central Freight Association territory than in Western Trunk Line territory. There is a great difference in industry as between Western Trunk Line territory and Central Freight Association territory. In Western Trunk Line territory, industry is largely agriculture and livestock and production related to those industries which results in a low ratio of class rate traffic; while, in Central Freight Association territory, industry is largely that of the kind that produces manufactured commodities of an entirely different nature and which is, to a major extent, class rate traffic.

[fol. 4998] Page 3 is self-explanatory and pictures some of the differences between Central Freight Association territory and Zones 1, 2 and 3 in Western Trunk Line territory and some of the differences between those zones. The detail of this information is shown on pages 4, 5 and 6. The population per mile of railroad, line 11, page 3, is particularly enlightening.

The fact that, as disclosed on pages 1 and 2, the value of manufactures in Central Freight Association territory increased at a considerably greater ratio than in W.T.L. territory, 1939 over 1933, must be considered in connection with the industrial centers, that is, those centers producing consumers' goods, were more seriously affected by the depression than the communities having a lesser degree of industrialization, and, for this purpose, page 7 of the exhibit has been prepared, which shows for that part of Central Freight Association territory used throughout the exhibit, and taking the year 1929 as representing 100 per cent, that area fell to 38.97 per cent in 1933 and recovered to 78.70 per cent in 1939 contrasted with Zone 1 where the value of manufactures fell to 44.08 per cent in 1933 and recovered to 75.34 per cent in 1939; Zone 2, which dropped to 42.76 per cent in 1933 and recovered to 62.74 per cent in 1939, and Zone 3 which receded to 46.66 per cent in 1933, and, in 1939 recovered to 67.83 per cent of the 1929 production.

There are many factors to be considered in respect to the [fol. 4999] greater increase in manufactures in Central Freight Association territory for the years mentioned as compared with Zones 1, 2 and 3 in Western Trunk Line territory. One of particular significance following the depression was the tremendous recovery of the automobile industry which reached its peak around 1929 and 1940, and it cannot be overlooked that the greater production of automobiles, parts and accessories is in Central Freight Association territory. Another factor of some significance is that with the end of prohibition in 1934, the distilling and brewing industry came back into the picture, and, since the location of the larger of that type of industry is in Central Freight Association territory, including Illinois, the increase in manufactures, 1939 over 1933, is further augmented. A striking example is Peoria, Illinois, Line 20, page 1, of my exhibit, which shows a ratio of 283.2, and Evansville, Indiana, line 30, a ratio of 212.3.

Pages 9 to 28 of my exhibit furnishes detailed information in respect to population and value of manufactures for the areas included in W.T.L. Zones 1, 2 and 3, in the States of Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska and Kansas. A recapitulation of this information is set forth in condensed form on page 6, contrasted with similar date for that part of Central Freight Association territory which has been referred to heretofore. These figures have been separated as to those [fol. 5000] for Central Freight Association territory and for Zones 1, 2 and 3 of W.T.L. territory. It should be observed that in a general investigation of this nature the average conditions in a territory should be considered. In Central Freight Association territory, as described on page 6, lines 9 to 14, population per mile of railroad in 1940 was 749. The value of manufactures per mile of railroad in 1939 was $505,494. In Zone 1, Western Trunk Line territory for the same years, population per mile of railroad, 313—value of manufactures $92,579. Zone 2 population per mile of railroad, 280; values of manufactures $64,754. Zone 3, population per mile of railroad, 203; value of manufactures $24,954. In this connection, value of manufactures per 1,000 population, as shown in the last column on page 6, should have consideration, the total for Central Freight Association territory being, for 1939 per 1,000 of population as of 1940, $674,969; Western Trunk Line territory Zone 1, $295,521; Zone 2, $230,995; Zone 3, $122,845. The foregoing depicts some of the average conditions in these territories and, as was stated by the Commission in report in I.C.C. Docket 17,000, Part 2, 164 I.C.C. 198: "Differences considered in fixing zone boundaries are the averages, throughout the areas, of traffic and population densities, operating conditions, jobbing and other commercial and industrial competitive situations, and the rate bases prescribed in other case. Although those conditions rarely change abruptly, zone boundaries must be fixed some- [fol. 5001] where, and thus to some extent arbitrarily but based upon mature deliberation and informed judgment."

In setting forth the figures and averages as indicated in my exhibit, the lines of the rate zones have been strictly observed to the extent possible in showing population and value of manufactures; therefore, St. Louis, Missouri, as an example, is included in Zone 1, and Kansas City, Kansas, is included in Zone 2; likewise, Omaha, Nebraska. But St. Louis, Missouri, if shipping to or receiving class rate traffic from points in the east, has the Central Freight Association rate scale. If shipping westward or receiving freight from the west, the Western Trunk Line scale of rates applies. Kansas City, Kansas, and Omaha, Nebraska, if shipping eastward or receiving freight from the east, have rates made on basis of the mileage traversed through Zone 1 territory, but, if the movement is from or to points west, the rates are made on the basis prescribed for the zones applying in that direction. This is mentioned for the reason that the average figures for Zone 1 as to population and the value of manufactures is increased by including, for example, St. Louis, Missouri, in Zone 1, and, likewise, the figures for Zone 2 are inflated by including Kansas City, Kansas, and Omaha, Nebraska. Other situations could be mentioned but these are cited as examples and for the reason that those more heavily populated and heavier producing communities which are located on the border [fol. 5002] line might as well have been included in this exhibit, in the zone having the lower rates, but by strictly following, from a statistical point of view, the boundaries of the zones as prescribed by the Commission in I.C.C. 17,000, Part 2, the more thinly populated and less productive areas in respect to the showing which we are making in this presentation are, to some extent, favored. In other words, if Kansas City, Kansas, which is located immediately adjacent to the western boundary of Zone 1 with population of 121,458 and value of manufactures of $167,228,236, was taken out of the total shown for Zone 2 on page 26, the averages in population per square mile and the value of manufactures for that zone would be greatly reduced. Kansas City, Kansas, is in Wyandotte County and the average population per square mile for that county is 960.7 for 1940, whereas the average for Zone 2 in the State of Kansas is 38, including Wyandotte County. The value of manufactures for Wyandotte County in 1939 was approximately $177,000,000 compared with the total in Zone 2 of Kansas, including Wyandotte County, of approximately $259,000,000.

The maps reproduced on pages 30, 31, 32 and 33 are complementary to the statistics by counties as shown on pages 9 to 28 inclusive, and are for the purpose of presenting a picture of the existing zones when considered with the statistical data mentioned of traffic conditions in detail within those zones.

[fol. 5003] It is the belief of the Western Trunk Line railroads that the information contained in my exhibit fully justifies the position heretofore taken that existing conditions do not warrant any alteration of the present class rate structure. Without going into further detail, the exhibit, in our opinion, definitely shows the great contrast in conditions as between Official territory and Western Trunk Line territory, and the considerable differences on the average as between the presently existing zones in W.T.L. territory which, we believe, graphically pictures the conditions that justify the higher lever of rates in Zone 1, of W.T.L. territory than applies in Official territory and progressively higher rates in Zones 2 and 3 of W.T.L. territory.

Mr. Taylor: You may cross-examine.

Commr. Aitchison: Any cross-examination? Apparently not.

Mr. Taylor: That is all, Mr. Hamilton.

Mr. Barron: Mr. Chairman, we have one more witness for the Southwest, Mr. Roberts, of Dallas. His exhibits were expressed last Friday. Unfortunately they have not been received, and with the permission of your Honor, we would like to put Mr. Roberts on some time tomorrow, if these exhibits are received in time to be distributed before he testifies.

Commr. Aitchison: All right. You call the matter up again then tomorrow.

[fol. 5004] Mr. Barron: Yes, sir, I will.

Mr. Hughes: Mr. Chairman, that concludes for the present the presentation of the Western lines.

Mr. McCollester: I have a witness I could call at any time, Mr. Chairman.

Commr. Aitchison: All right.

George B. Robinson, previously sworn as a witness testified as follows:

Direct examination.

By Mr. McCollester:

Q. You are the same George B. Robinson who testified on this hearing, in this proceeding?

A. Yes, sir.

Q. You are connected with the Division of Commerce of the State of New York?

A. I am.

Q. In what capacity?

A. Director of the Bureau of Planning of the Division of Commerce.

Q. For the purposes of this proceeding you prepared and identified, did you not, an exhibit which was marked as No. 160 and received in evidence, which was a reproduction of excerpts from publications relating to industrial progress in the South?

A. I did.

Q. Have you prepared a similar exhibit reproducing por- [fol. 5005] tions of later publications in order to bring the issue more nearly down to date?

A. I have.

Q. Is that the yellow covered document that you have before you?

A. It is.

Mr. McCollester: May that be marked, Mr. Commissioner?

Commr. Aitchison: Exhibit 219.

(Exhibit No. 219, Witness Robinson, marked for identification.)

Commr. Aitchison: These are all from the Manufacturers Record, aren't they?

The Witness: And from the Year Book of Manufacturers, the Blue Book of Southern Progress, an annual publication of the Manufacturers Record Publishing Company, which also publishes the Manufacturers Record.

Commr. Aitchison: Well, that is one of the documents that was referred to by a gentleman—I have forgotten his name.

Mr. McCollester: That is right; the editor of the Manufacturers Record.

Q. You have produced portions of the publication in the same way that you did in your Exhibit 160; is that correct?

A. Yes, sir.

Mr. McCollester: We offer Exhibit 219 in evidence.

Commr. Aitchison: Without objection it is received.

[fol. 5006] (Exhibit No. 219, Witness Robinson, Received in evidence.)

Mr. McCollester: You may cross-examine.

Cross-examination.

By Mr. Norman:

Q. On page 4, headed "Diversified Manufacturing in the South" what is included "in the South" there?

A. The South includes those States which are named, starting on page 10, at the top of the columns, in the "Economic Summary by States 1941."

It includes Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia and West Virginia.

Q. On page 9, for example, that is consolidated as to all of those States; is that right?

A. I understand that is a summary table of the following data by States for the region that is designated as the South by the Blue Book of Southern Progress.

Q. And the purpose of this exhibit is to show the extent to which manufacturing has developed in the South?

A. Yes, sir.

Q. Now, another witness for the State of New York has testified that the South ought to develop its manufacturing before it asks for rates on manufactured articles comparable to those where the development has taken place,

[fol. 5007] Mr. McCollester: I don't know of any witness who testified to that effect.

Mr. Norman: Dr. Van Meter certainly did so testify.

Q. I would just like to ask you how much further you think the South should have to develop its manufacturing before it got to that place?

Mr. McCollester: Well, I object to that as not proper cross-examination

Commr. Aitchison: I think it goes beyond the scope of the direct examination a great deal. He has not testified——

Mr. Norman: He what?

Commr. Aitchison: He has not made any deadline.

Mr. Norman: I know he has not made any deadline. That is what I am asking him to draw.

Mr. McCollester: You are cross-examining him on Dr. Van Meter's testimony.

Mr. Norman: Well, I will ask him this question then.

Q. Do you think the facts shown by your exhibit establish that the South has so progressed with its industry and manufacturing as to be in the class where it is entitled to rates on manufactured articles compared with those in other territories?

Mr. McCollester: I object, because the witness has not been offered as the witness to testify at all about freight rates, or how freight rates should be made.

Mr. Norman: I am not asking him about any freight rates.

[fol. 5008] Commr. Aitchison: This objection is sustained. This testimony, if it is material and relevant here at all is an impeachment or for the purpose of enabling us to give proper weight to the testimony of the editor of the Manufacturing Record, who testified as a witness in this proceeding.

Mr. Norman: The point is, Mr. Chairman, that they take both horns of their dilemma when it comes to the South. They say first you must build your mouse trap; you haven't built your mouse trap and therefore you are not entitled to rates on manufactured articles; and then, in the very next breath, representing the same interests, they come along and say, just what you have done, that you have developed your manufacturing to a point that it is just amazing. Now, one or the other, it seems to me, must be in possession of the facts.

Mr. McCollester: I don't think I need to argue the point.

Commr. Aitchison: No. I has been ruled on.

Mr. McCollester: All right.

Mr. Norman: That is all.

Mr. McCollester: That is all, Mr. Robinson.

Mr. Norman: Mr. Commissioner, I have been taken by surprise here. I had no idea I would be reached until tomorrow.

Commr. Aitchison: Is anybody else prepared to go on?

Mr. Norman: Mr. Henderson can go on, but he has——

Commr. Aitchison: Off the record.

(Discussion off the record.)

[fol. 5009] Commr. Aitchison: You may proceed.

T. M. Henderson, was sworn as a witness and testified as follows:

Direct examination.

By Mr. Norman:

Q. State your name and residence.

A. My name is T. M. Henderson; residence, Nashville, Tennessee.

I am Commissioner of the Nashville Freight Bureau (organized in 1910 as the Traffic Bureau of Nashville), which position I have held for the past 32 years. Prior to my connection with the Nashville Freight Bureau I was employed in the traffic departments of the Southern Carriers for a period of about 10 years in the capacity of rate clerk, chief rate clerk, and chief clerk, and my traffic experience covers a period of approximately 43 years.

I am a registered Practitioner before the Interstate Commerce Commission, holding certificate dated August 12, 1929, and am a member of the Association of Practitioners before the Interstate Commerce Commission and one of the regional vice presidents of that association.

I have been a member of the Board of Governors of the Southern Traffic League since its organization, June, 1918, and have served one term as president, several terms as chairman of its Board of Governors, and have been executive secretary of the League since April, 1930.

I am a member of the Traffic Committee, employed by the [fol. 5010] Southern Governors Conference, to prepare and present the rate evidence in these proceedings.

I appear in rebuttal of statements made to the effect that these proceedings are the result of politics, and that Southern industry is not supporting the effort to secure an equality of class rates and ratings with the class rates and ratings in Official Classification territory, and in rebuttal of statements that the establishment of commodity, or so-called column, rates to Official Classification territory, on the same level as rates within the Official territory can, and should, be obtained through individual or specific adjustments, inasmuch as the Official Classification lines, since the decision of the Commission in the case known as the Governors' Commodity Case, 235 I. C. C. 255-350, have not declined to join the Southern carriers in rates to Official territory made on the Official territory level.

I will show that organizations representing a large proportion of the manufacturing industry in the South are now, and have in the past, fully supported the position of the Southern Governors in their efforts to obtain a parity of class rates with the class rates within Official territory and, in fact, the movement to secure this parity of rates originated with the jobbing and manufacturing interests in the South, and not with the Southern Governors.

I will also show that as a practical matter the trouble can [fol. 5011] not be cured by individual or piecemeal adjustments.

In order to properly present this matter it will be necessary to give an outline of the membership and purposes of these organizations, with a brief history of their efforts to secure relief from the present class rate adjustment within, and from the South.

The Nashville Freight Bureau is a non-profit, voluntary association of merchants and manufacturers, incorporated under the laws of the State of Tennessee, with the principal place of business at Nashville, Tennessee. Its activities are directed toward the promotion and fostering of the commercial interest of its members and the City of Nashville, as a whole, in the matter of transportation charges, rules, and practices.

The Southern Traffic League is a corporation existing under the laws of the State of Georgia, with its principal office at Nashville, Tennessee. It is a non-profit, southern traffic organization, having in its membership many of the largest and most important shippers and traffic organizations in the South.

As Commissioner of the Nashville Freight Bureau I act in the capacity of general traffic manager, or traffic consultant, for its members; handling rate adjustments with the carriers and rate committees of the carriers, formal and informal complaints before the Interstate Commerce Commission and the Railroad and Public Utilities Commission of the State of Tennessee.

The membership of the Nashville Freight Bureau includes [fol. 5012] practically every line of industry in Nashville, such as manufacturers of paper boxes; distributors of paper and paper articles; wholesale hardware dealers; dealers automobile accessories; producers of sand and gravel; manufacturers of brick and dealers in building material; retail department stores, manufacturers of lumber and hardwood flooring; dealers in farm implements; manufacturers of stoves and related articles; producers of cereal products; feed manufacturers; wholesale grocers; manufacturers of bed springs and mattresses; printers and dealers in office supplies; wholesale druggists; iron and steep fabricators; public utilities, manufacturers and dealers in machines and supplies; manufacturers of caskets; publishers of newspapers; cold storage concerns, ice manufacturers; wholesale dry goods and notions; contractors; producers of stone; manufacturers of candy; manufacturers of wood and metal culvert; plumbing and heating supply companies; manufacturers of work clothes and shirts; oil refiners and large consumers of coal.

Commr. Splawn: You mean, industrial consumption of coal?

The Witness: I didn't hear you.

Commr. Splawn: You mean, consumption of coal in the industries?

The Witness: That is right, and by the city of Nashville itself, in its various departments.

The City of Nashville, as a municipality, and the Cham- [fol. 5013] ber of Commerce of Nashville, are members of the Bureau, so it can be fairly said that the Bureau represents every commercial and industrial interest in the city.

The membership of the Southern Traffic League is confined to actual shippers and bona fide traffic and transportation organizations, Chambers of Commerce, and so forth, so that the League represents the commercial and industrial interests more fully than would be indicated by the numerical membership. For example, I have no individual membership in the League; the Nashville Freight Bureau is a member, and I have shown the wide and varied commercial and industrial interest represented in the membership of the Bureau.

I am the representative of the Nashville Freight Bureau in the activities of the League.

The same is true of a number of other organizations, such as the Atlanta Freight Bureau, the Chattanooga Manufacturers Association, the Charlotte Shippers and Manufacturers Association, the Cotton Manufacturers Associations of South Carolina, the North Carolina Cotton Manufacturers Association, the Georgia-Alabama Textile Traffic Association, the Southern Furniture Manufacturers Association, the Southern Newspaper Publishers Association, the Growers and Shippers League of Florida, the Harlan, Hazard and Southern Appalachian Coal Operators Association, the Jacksonville Traffic Bureau, the Memphis Freight Bureau, the Tampa Traffic Association and other similar organi- [fol. 5014] zations, the Port Authorities of the States of South Carolina, Florida, Virginia and North Carolina. There is also included in the membership individual concerns engaged in the business of manufacturing, processing and distributing, grain and grain products, lumber, cement, textiles, canned goods, cotton and paper bags, brick, clay, clay products, sand, gravel, chemicals, paper, cigarettes, tobacco, vegetable oils, and other commodities.

The members are located in Atlanta, Georgia; Birmingham, Alabama; Charleston, South Carolina; Charlotte, North Carolina; Chattanooga, Tennessee; Chicago, Illinois, Cincinnati, Ohio; Clinton, Iowa; Danville, Virginia; Enka, North Carolina; Greensboro, North Carolina; Griffin, Georgia; Hamilton, Ohio; Hartsville, South Carolina; High Point, North Carolina; Indianapolis, Indiana; Jacksonville, Florida; Kannapolis, North Carolina; Knoxville, Tennessee; Miami, Florida; Mobile, Alabama; Nashville, Tennessee; New Orleans, Louisiana; New York, New York; Norfolk, Virginia; Orlando, Florida; Pisgah Forest, North Carolina; Richmond, Virginia; St. Louis, Missouri; Salisbury, North Carolina; Savannah, Georgia; Tampa, Florida; Toccoa, Georgia; Wilmington, Delaware; Wilmington, North Carolina; and Winston-Salem, North Carolina.

Speaking first with respect to the position and activities of the Southern Traffic League. The rates prescribed by the Interstate Commerce Commission in the Southern [fol. 5015] Class Rate Investigation, Docket 13,494, 100

I. C. C. 513, decided July 7, 1925, and Supplemental Reports, 109 I. C. C. 300, decided April 12, 1926, 113 I. C. C. 200, decided July 19, 1926, and 128 I. C. C. 567, decided July 19, 1927, were never satisfactory to the traffic men representing the commercial and industrial interests in Southern territory.

These rates are considerably higher than advocated by the Southern Traffic League, in Docket 13,494, for application in the Southern territory and between Southern and Official territory.

These rates were considered and discussed by the members of the Southern Traffic League for several years, and at a membership meeting of the League, held in Atlanta, Georgia, March 21, 1934, the following six-point program was adopted:

1. To secure a reduction in the class rate level in the South.

2. To secure a readjustment and reduction in the interterritorial rates from Southern to Official Classification territory.

3. To continue participation and activities in the Consolidated Southwestern Cases until they are finally disposed of.

4. To secure an equality of rates from the South to Southwestern and Western Trunk Line territories, with the rates from Official to Southwestern and Western Trunk Line territories.

[fol. 5016] 5. To bring about a simplification and liberalization of the rules and regulations, and packing requirements of the Consolidated Classification.

6. To bring about a more expeditious handling of rate proposals by the Southern Freight Association and other standing rate committees of the carriers.

This program was considered and unanimously approved, by the members at subsequent meetings of the League.

In an effort to carry out the first part of the program of the League, adopted at Atlanta, Georgia, March 21, 1934, the Board of Governors, in March, 1934, asked for an immediate conference with the executives of the Southern carriers, but it was not until May 24, 1935, that we were able to arrange the conference, which was held in Atlanta, Georgia, on that date.

The Southern carriers advised that they would not consider a revision of the class rate structure.

The Southern Railroad and Public Utilities Commissions became interested, and after several meetings between the Board of Governors of the Southern Traffic League and the Southern Railroad and Public Utilities Commissioners, Mr. J. P. Wilhoit, at that time chairman of the Public Service Commission of Georgia, arranged for another conference with the carriers' executives, when the executives of the Southern carriers were again requested to give consideration to a downward revision of the class rates [fol. 5017] within the South, and the southern carriers again declined to consider any revision in the then existing mileage scale.

Upon the second refusal of the Southern carriers to consider a revision of the Southern Class Rate scale, the Board of Governors of the League held a special meeting at Atlanta, Georgia, September 3, 1935, and concluded to join the Southern Railroadand Public Utilities Commissions, in a petition to the Interstate Commerce Commission to institute a general investigation of class rates, and this action of the Board was unanimously approved at a membership meeting of the League at Greensboro, North Carolina, September 18, 1935.

The scope of the investigation was discussed at a number of meetings of the League, joint meetings of the League and Southern Railroad and Public Utilities Commissioners and interested shippers, not members of the League, and after all of the discussions, it was concluded to limit the petition for the investigation to class rates within the Southern territory, eliminating, at that time and in these proceedings, interterritorial class rates and intra and interterritorial commodity, or so-called column, rates.

Petitions, seeking the investigation as outlined, were filed on September 25, 1936, by the Southern Traffic League, the Association of Southern Railroad and Public Utilities Commissions, and by most of the Commissions individually. [fol. 5018] Similar petitions were filed by the North Carolina Traffic League and a number of the individual members of the Southern Traffic League.

Petitions were filed by the rail carriers, and by shippers outside Southern territory, to have the scope of the proceedings enlarged to include interterritorial class rates, between the Southern and Official territory, which were submitted to all parties.

The League and others, parties to the original petitions, filed answers, urging that the investigation be confined to class rates within Southern territory, and protesting against any broadening of the issues as set out in the original petitions. Our objections were overruled and the Commissions instituted Southern Class Rate Investigation, Docket No. 27655,

We insisted that the investigation be limited to the class rates within Southern Territory because we felt that the high level of class rates within the Southern Territory was the root of the evil and the foundation of the whole trouble. It was our thought that the investigation of these rates would be a fairly simple matter, involving a relatively small record and could be disposed of in a relatively short time, and that with reasonable class rates within the South, reasonable interterritorial class rates would automatically follow.

Our efforts to secure a revision in the class rates received much publicity in the newspapers; the Southern Governors [fol. 5019] became interested; had several meetings with the Southern Railroad and Public Utilities Commissions and the Board of Governors of the League, and at a meeting in Atlanta, Georgia, May 11, 1937, the Southern Governors took the matter in their hands and concluded to file a separate complaint involving certain commodities, which are included in Docket No. 27746, State of Alabama, et al., vs. the New York Central Railroad Company, et al., reported in 235 I. C. C. 255. This case was placed in the hands of a special committee of three Southern Governors, of which Honorable Bibb Graves, at that time Governor of Alabama, was Chairman.

The Southern Class Rate Investigation, Docket 27655, was placed in the hands of a special committee of three Southern Governors of which Honorable Gordon Browning, at that time Governor of Tennessee, was Chairman.

The Southern Traffic League intervened in favor of complainants in the Governors' Commodity Case, Docket No. 27746, but the League, as such, took no active part in the case, because the attorneys employed by the Governors, employed rate experts, statisticians, and so forth, to prepare the necessary data and made their own arrangements for commercial witnesses.

Both traffic men employed by the Governors in that case, were members of the Southern Traffic League, but were not employed as representing the League. They were authorized, however, to testify that the League advocated the [fol. 5020] rates sought, that is, the same level as within Official territory.

While these cases were on the docket of the Commission, and before the commodity rate case was heard, numerous petitions were filed by interests in the East to consolidate Docket No. 27746 and the Class Rate Case, Docket 27655, and the Southern Traffic League, and others, filed briefs in opposition to the consolidation, and the petitions for the consolidation were denied.

The Governors' Committee, in charge of the Class Rate Investigation, Docket No. 27655, employed counsel and made plans for the presentation of that case, but the hearing was delayed, from time to time, and the committee in charge finally concluded that the time was not opportune for the presentation of the class rate case, and on request of counsel, representing the Governors, these proceedings were discontinued, without prejudice to future consideration, by order of the Commission dated April 11, 1938.

At a membership meeting of the Southern Traffic League, held in Charlotte, North Carolina, March 15, 1939, at which members of the Railroad and Public Utilities Commissions of Tennessee, North Carolina and Florida were present, the League unanimously adopted a resolution to request the Interstate Commerce Commission to reinstate the Class Rate Investigation, and a special committee of the League was appointed to personally present the petition to the Inter- [fol. 5021] state Commerce Commission.

Commr. Aitchison: May I interpose there? Now, down to this time, if I have followed your narrative correctly, nothing has been indicated which showed that you were interested in getting a uniformity of classification as between the two territories, other than covered by Point 5 in the six-point program adopted in 1934; is that correct?

The Witness: Mr. Chairman, our idea at that time was to take, as we thought, the quick course to secure uniformity; in other words, we felt if we could get an equal level of rates and classification within the South, that automatically we would get it interterritorially; in other words, if the rates within the South were on a parity with the Eastern scale, the rates and classifications the same, there could be no argument in our minds about having interterritorial rates on the same basis.

Commr. Aitchison: But I have not caught anything yet in your presentation which would indicate that you had in mind getting the same classification in the two territories.

The Witness: Well, it was not mentioned, but the equality of the rate was what we had in mind.

Commr. Aitchison: At that time the same disparity existed; did it not, with respect to different consists of the classes below first, in the Official and Southern classifications, both carried in the consolidated classification.

[fol. 5022] The Witness: That is right, yes. As I say, while the classification, as I recall it, was not considered in detail and was not included in the program, the whole idea was to secure a parity of rates, and to that, we would necessarily have to have a uniform classification. What I mean to say, the whole idea back of the program was to have an equality of rates, and without an equality of classification we could not get an equality of rates.

Commr. Aitchison: That implied also a uniformity then under your points, with the Western classification as well.

The Witness: Yes, sir.

Commr. Aitchison: Well, I don't want to interrupt you now further on that, but you can be thinking about it. I want to ask you later if you did not at one time have an opportunity in the South to get the Western classification applied in that territory, and there was so much opposition to it that it was withdrawn? I will ask you about that later, but in your subconscious mind you can be thinking about it in the meantime.

Mr. Grubbs: If the Commission please, while there is a lull here, there is a problem troubling me that I think ought to be raised. As I understand the nature of this testimony, it is presented as rebuttal to the testimony that was presented by the Southern railroads.

Commr. Aitchison: By Mr. Ribe and Mr. Ridell and others.

Mr. Grubbs: Yes, sir. Now, as I understand the rules [fol. 5023] of procedure, unless there is some special ruling to open and close the case, the Southern railroads opened the case and then presented rebuttal. and now this comes, it seems to me, in the nature of surrebuttal.

Commr. Aitchison: All right. Well, let him have surrejoinder. We won't have any trouble when we get done with this. We will see that you all have an opportunity to be heard.

Mr. Grubbs: That is all I want to know, if we will have an opportunity, in the event we see fit, to reply to the statements that are being made at this time. Thank you, your Honor.

Commr. Aitchison: You will have reasonable opportunity.

Mr. Norman: There should be some here at this hearing.

Commr. Aitchison: Well, we will later, after that.

Mr. Norman: And besides, I want to joint out that counsel says that the Southern railroads introduced their case first. We all know what kind of a case they introduced. They just didn't introduce. They waited until we went on the stand and then came forward with their case.

Commr. Aitchison: Well, so long as we get the facts out of here, we will act in the future and hope we act advisedly, and it is not so important as to the order in which we get those facts.

Mr. Norman: All right.

By Mr. Norman:

Q. Proceed, Mr. Henderson.

[fol. 5024] A. This committee, with a committee representing the Southern Governors and the Southern Railroad and Public Utilities Commissions, arranged for a conference with the Interstate Commerce Commission, Washington, D. C., May 31, 1939, when the Commission was asked to reinstate the investigation, and again urged to confine the investigation to class rates within the Southern territory. At that conference we were assured that our requests would be given consideration, but that the Commission, at that time, could not commit itself to confine its investigation to the limits requested by the League, the Southern Governors and Southern Railroad and Public Utilities Commissions.

Following our conference, the Commission issued its order of August 1, 1939, instituting a general investigation of the class rates, to, from and between all points in the United States, East of the Rocky Mountains, Docket No. 28300, and at the same time, instituted, its investigation in Consolidated Freight Classification, Docket No. 28310, and Motor Carrier Classification, Docket No. MC-C 150.

In our Conference in Washington, D. C., May 31, 1939, we requested the Commission, in its study of the class rates within the Southern territory, to provide the following information for the record:

1. Cost studies in Southern and Official territories.

2. Classification analyses of ratings in the Southern and [fol. 5025] Official classifications, and exceptions.

3. Appropriate revenue tests.

4. Appropriate analyses of traffic, including character of traffic, traffic flows, and the determination of commodities moving on class rates and upon the basis of percentages of the first class rates.

The original notice to the public, and order against the railroads, indicated that the Commission would supply certain information, which it has done, and required the railroads to furnith other information, which was later eliminated from the order.

The menbership of the Southern Traffic League was unanimous in its opinion that there should be an investigation of class rates, for the purpose of putting the rates within the South, and the interterritorial rates between the South and the North, on a parity with the class rates in Eastern or Official Classification territory, to remove these rate barriers.

During all of its discussions and considerations of the question, extending over a period of six years, there was no dissent from this position, and it was not until the formation of the Southeast-Southwest Shippers' Conference at Birmingham, Alabama, April 5, 1940, that any difference of opinion arose.

The Southeast-Southwest Shippers Conference is an organization, the membership of which is composed almost exclusively of the producers and shippers of raw materials, [fol. 5026] semi-manufactured products, and completely manufactured articles, the rates on which have been established on a satisfactory basis, through negotiations with the carriers, or by orders of the Interstate Commerce Commission. (See State of Alabama, et al., vs. NYC R. R., et al., 235 I. C. C. 255-350 and cases cited therein.)

This group has little, if any, interest in class rates or classification ratings.

Several members of the League affiliated themselves with the Southeast-Southwest Shippers' Conference, and as a result of the Birmingham meeting, April 5, 1940, a difference of opinion did arise, with the membership of the Southern Traffic League.

As a result of this difference of opinion the Southeast-Southwest Shippers' Conference called a meeting in New Orleans, Louisiana, May 17, 1940, and Mr. W. A. Gunn, President, T. M. Henderson, Executive Secretary, and E. L. Hart, Traffic Manager, Atlanta Freight Bureau, all members of the Board of Governors of the League, were invited to attend, and discuss the difference of opinion, in an effort to iron out these differences, and present to the Commission a program satisfactory to all interests.

At the New Orleans Meeting the following resolutions were adopted by the Southeast-Southwest Shippers' Conference:

"Whereas, the prepared statement of President Gunn, Southern Traffic League, shows that the policies of the [fol. 5027] Southern Traffic League are in accord with the principles *an*nunciated by this group at its Birmingham, Alabama, meeting, on April 5, 1940.

"Therefore, Be it Resolved that we request the Southern and Southwestern Traffic Leagues to urge the Southern Governors' Conference and the Interstate Commerce Commission that the Class Rate Investigation exclude from consideration all carload rates regardless of how published, whether specific commodity, column, percentage of first class, or classification ratings."

The resolution was submitted to the members of the Southern Traffic League for a mail vote and a majority voted against same.

The resolution was again considered at a membership meeting of the League, in Greensboro, North Carolina, September, 1940, and was again defeated by a majority vote of the members present.

In Docket 13494, 100 I. C. C. 612, decided July 7, 1935, Chairman Eastman said:

"The rates in issue are class rates applicable, not to a particular commodity, but to a multitude of different kinds of relatively high-grade traffic. Neither points of origin nor points of destination are restricted. In Southern territory big shippers and little shippers, great cities and small towns, are alike interested in class rates, and there are no natural conditions affecting production or consumption [fol. 5028] which divide them into groups so far as such traffic is concerned.

Commr. Aitchison: Am I to judge from that that our then Chairman, Commissioner Eastman, was in error? You say that the members of the Southeast-Southwest Shippers' Conference are not interested in the class rates.

The Witness: I didn't understand you.

Commr. Aitchison: I am just asking whether or not Commissioner Eastman was in error, or there is some conflict in your statement at the top of page 15 that the Southeast-Southwest Shippers' Conference has little, if any, interest in the class rates.

The Witness: Well, that group has not, and they are the ones that are opposing this investigation.

Mr. Norman: But, that does not negative the idea that there are big shippers who do have an interest in it, and that is what Mr. Eastman says.

Commr. Aitchison: Big and little both, he says.

Mr. Norman: Yes; well, they are big and little, both, even though they can't all be big.

Commr. Aitchison: Well, the fair inference from what Commissioner Eastman then said was that everybody in the South was interested in class rates.

The Witness: Well, that is one purpose of the testimony, in rebuttal of statements that have been made, that industry in the South is not interested in class rates. We say it is.

[fol. 5029] Commr. Aitchison: All except those of them that you have described at the top of page 15.

The Witness: The Southeast-Southwest Shippers' Conference; yes, sir, who do not ship on class rates.

Commr. Aitchison: All right. Clearly Mr. Eastman must have been wrong then in saying "there are no natural conditions affecting production or consumption which divide them into groups so far as such traffic is concerned."

The Witness: Well, so far as class rate traffic was concerned.

Commr. Aitchison: Yes.

The Witness: Of course, there are some big shippers that ship on class rates, and they are interested in the class rate adjustment. There are other big shippers who do not use class rates and they are not interested, but our point is that the big shippers and the little shippers, the big cities and small cities in the South, are vitally interested in the class rate adjustment.

Mr. McCollester: Except for those who are members of the Southeast-Southwest Conference.

The Witness: I said there are big shippers and little shippers in the South that are vitally interested in the rates.

Mr. Grubbs: So as not to interrupt Mr. Henderson when he begins to take up his next paragraph, I notice an argument begins at this point, and I would like to object to the [fol. 5030] argument that proceeds from this point on.

The Witness: I don't see any argument.

Mr. Norman: Well, the very next sentence says "There is, therefore, no foundation for the statements made by certain commercial traffic men in the South," and so forth.

By Mr. Norman:

Q. That is a statement of fact, is it not?
A. Yes, sir.

Commr. Aitchison: It all bears on something that none of you have read, and that is the question whether there is the demand from business and industry in the South for a revision of class rates, and also a question which is implicit as to whether it is in the best interests of the business and industry in the South that there should be a revision, whether they demand it or not. There has been testimony with respect to that very matter, and clearly Mr. Henderson is entitled to give us the benefit of his experience and knowledge of the history and the present conditions with respect to whether there is this demand which has been mentioned. Proceed.

A. (Continuing) The foregoing clearly indicates the general interests in, and the importance of, the measures and relationship of class rates to, from, and between, points in the Southern territory. There is, therefore, no foundation for the statements made by certain commercial traffic men in the South, and by witnesses of the carriers, that there is no demand from business and industry in the South for a revision of class rates, to remove rate barriers and dis-[fol. 5031] criminations, and to establish a parity of class rates and a uniform classification, within the South and between the Southern and Eastern territories.

Commr. Splawn: Is that demand, Mr. Henderson, limited to between the South and Eastern territory?

The Witness: Well, no. I think the Southwest have put in their——

Commr. Splawn: I mean, so far as the South is concerned, is the only interest in the South in class rates, in the rates within the South and between the South and Official territory?

The Witness: No. Our interest is between the South and Southwest and Western Trunk Line as well. Our greater interest is between the South and Official.

Commr. Splawn: What is the position of your people as to this question of parity or equality of rates that you were speaking of in the first part of this statement? Do you want that applied throughout the territory involved in this investigation?

The Witness: Yes; we have no objection to that. Our principal interest, as I say, is in the rates between the Official and the Southern territories, but we concede that the people in the West and Southwest are entitled to like treatment, and we have no quarrel with that at all.

By Mr. Norman:

Q. Is it not also the position of the southern interests that they desire a parity of rates with Official Territory to and [fol. 5032] from these other territories?

A. Oh, yes; that is very definite, and that was one of the points in the original program of the Southern Traffic League.

Mr. McCollester: May I just observe—you may have covered it, but I failed to note in any thing that precedes the bottom of page 16, anything to support the very last part of that sentence at the bottom of page 16, that there is a demand for a parity of rates between the Southern and Western territories. It would seem to me that your whole history was to the effect that the southern interests were concerned with revising the class rates within the South and wanted the revision confined to a revision within the South, and I don't find any mention before that of anything to do with the rates between the South and Eastern territories.

Commr. Aitchison: Well, you look at the top of page 7, Point 2.

Mr. McCollester: Right. I will take it back.

By Mr. Norman:

Q. Proceed, Mr. Henderson.

A. In supplemental report, 109 I. C. C. 323, decided July 19, 1926, Chairman Eastman said:

> "We are also persuaded that any attempt at a final solution of the interterritorial rate problem, at least so far as southern border territory is concerned, should be postponed pending the outcome of the Eastern Class Rate Investigation. The entire interterritorial adjustment will [fol. 5033] therefore be held for such further consideration of all the issues relating thereto as may seem appropriate, after further hearings, following our decision in that investigation."

No further consideration, or modification, of the interterritorial adjustment has been made since the outcome of the Eastern Class Rate Investigation, 164 I. C. C. 314-483, Docket 15879, decided May 13, 1930.

The program of the League to secure a reduction in the class rate level in the South, and a readjustment and reduction in the interterritorial class rates from Southern to Official Classification territory, was adopted March 2, 1934.

In "Class Rates Within the State of Georgia," 209 I. C. C. 602, Docket No. 26699, decided July 9, 1935, Commissioner Splawn, in a concurring opinion said:

> "In 1925, the Commission, in Docket No. 13494, Southern Class Rate Investigation, 100 I. C. C. 513 prescribed maximum reasonable rates for goods moving on class rates between points in Southern territory. Recently the adjustment of rates within, from, and to Southern territory has been subject to several attacks. I believe the Commission should reexamine the entire rate structure in this territory in view of the substantial changes in conditions which have taken place within the past eight years."

Petitions to the Interstate Commerce Commission, seeking an investigation of the class rates, were filed on Sep-

[fol. 5034] tember 25, 1936, by the Southern Traffic League, the Association of Southern Railroads and Public Utilities Commissions, by most of the Commissions individually, the North Carolina Traffic League and a number of individual members of the Southern Traffic League.

The Southern Governors Conference was organized at a meeting held in Atlanta, Georgia, May 11, 1937, at which time it was decided to file the commodity rate case, Docket No. 27746, by a committee headed by Honorable Bibb Graves, at that time Governor of Alabama, and to prosecute the class rate case, then pending, Docket No. 27665, under a committee headed by Honorable Gordon Browning, at that time Governor of Tennessee.

It will be noted that the Southern Governors did not come into the picture until eleven years after Chairman Eastman said that a final solution of the interterritorial class rates should follow the outcome of the Eastern Class Rate Investigation; seven years after the decision in the Eastern Class Rate Investigation; three years after the Southern Traffic League Committee itself to a program to have the class rates within the South and between the South and the East revised and reduced; three years after the Southern Traffic League requested a conference with the executives of the Southern carriers to consider such a revision; two years after Commissioner Splawn expressed the opinion that the Commission should re-examine the entire class rate structure in Southern territory; two years after the first con-[fol. 5035] ference the Southern Traffic League had with the traffic executives of the Southern Carriers with this end in view; two years after joint conferences between the Southern Traffic League and Southern State Public Utilities Commissions with the executives of the Southern carriers; two years after the Southern carriers twice declined to make any readjustment of the class rates; about one year after the Southern Traffic League, the Southern State Public Utilities Commissions and various traffic organizations in the South filed petitions with the Interstate Commerce Commission to institute an investigation of the class rates within Southern territory, and several months after the first investigation, Docket 27655, was instituted.

There is, therefore, no foundation for any conclusion, or statement, that these proceedings are the result of politics or that any politics are involved.

My own experience demonstrates the impracticability, in fact the impossibility, of handling commodity, or so-called column, adjustments individually, or removing the trouble by piecemeal adjustments.

First, we have to convince the lines serving Nashville that the competition exists, and the rates requested are necessary to meet the competition, before the matter is placed on the docket of the Southern Freight Association, and I will show later that it is not always possible to do this.

[fol. 5036] We then have to convince all the other carriers in the Southern territory that the proposed rates are proper and necessary.

When this is done the proposal has to go to the rate committees in the Official territory and they must be convinced—and this is always difficult and sometimes impossible, before the Southern carriers can authorize the publication of the rates.

When this is done, it takes an additional 45 to 60 days to have the rates published and made effective.

In the meantime, Southern manufacturers are unable to submit bids, on a competitive basis, with the manufacturers in Official Classification territory having lower rates.

For more than a year some of our manufacturers have been receiving invitations for bids, at delivered prices, on ammunition or shell shipping boxes, to destinations in the Official Classification territory.

The rating applicable on the kind, or type, of box on which we are being asked to submit bids is contained in Item 5800, page 30, Consolidated Freight Classification 15, which reads as follows:

"Boxes, ammunition or smokeless powder shipping, NOIBN, loose or in packages, minimum 24,000 pounds."

Boxes, described above, are rated fifth class, 45 per cent of first class, in the Southern Classification and 45 per cent [fol. 5037] of first in the Official Classification, and this rating applies interterritorially, from the South to Official territory.

The southern manufacturers pay 45 per cent of index 139 rates, whereas, the manufacturers in Official territory, shipping to points in Official territory, pay 45 per cent of index 100 rates.

Commr. Aitchison: These shipments were to be for the Government, were they?

The Witness: Yes, sir.

Commr. Aitchison: And were they delivered prices?

The Witness: That is the way the bids were sent out, yes, sir.

Commr. Aitchison: Would there be any matter of land grant rates involved there?

The Witness: Well, from Nashville I don't believe there would be to any point hardly in Official territory.

Commr. Aitchison: I see.

The Witness. There might be a few, but very little.

Commr. Aitchison: All right.

Q. (Continuing:) I have been handling, constantly, with the railroads, for more than a year, insisting that rates be established from Nashville to Official territory on a competitive basis.

At the March, 1942, meeting of the Southern Freight Association, 30 per cent of first class from the South to [fol. 5038] Official Classification territory and Southwestern Freight Bureau territory was approved on:

"Boxes, ammunition or shell shipping, wooden or wood, reinforced with metal, metal lined or not metal lined, CL, minimum weight 34,000 pounds, subject to Rule 34."

The 30 per cent basis, approved for general application from Southern territory to Official territory, has never been made effective, except to a limited number of points in southern Illinois and Indiana, located on the C. & E. I., I. C., L. & N., and Southern Railway, published in Item 2275A, page 19, of Supplement 36 to Freight Tariff 604, I. C. C. No. 87, issued by B. T. Jones, Agent and in Item 2392B, page 13, of Supplement No. 24 to Freight Tariff No. 90, I. C. C. No. 530, issued by W. S. Mercer, Agent.

I have asked for publication of rates, on this basis, to many specific points, during the past year, but rates from Nashville, Tennessee, on this description of boxes, have actually been published to only thirteen points; Blodgett, Drummond, Elwood, Elwood Ordnance Plant, Kankakee Ordnance Plant, Illinois, effective July 13, 1942, in Supplement 47 to I. C. C. No. 691, issued by R. H. Hoke, Agent, to Freeport and Galesburg, Illinois, effective February 15, 1943, and Hannibal, Missouri, effective February 27, 1943, in supplements 16 and 17 to I. C. C. 826, issued by R. H. Hoke, Agent.

Rates to Connersville, Indiana, Mansfield, Ohio, Marion, [fol. 5039] Ohio, and Muskegon, Michigan, have been published in Supplement No. 19 to I. C. C. No. 826, issued by R. H. Hoke, Agent, effective April 10, 1943.

I would like to call your attention right there to the fact that five of the points, or the rates to five of the points out of the thirteen, do not become effective until April 10, 1943, so there are only rates to eight points that have been made effective although the matter has been constantly up for over a year.

The rate to Mansfield, Ohio, was requested on June 3, 1942, authority for publication was issued by the Southern Freight Association on February 3, 1943, and the rate was published to take effective April 10, 1943.

Rates to Galesburg and Freeport, Illinois were proposed in Southern Freight Association Docket 1165, submittal No. 22708, dated September 1, 1942, and the rates were made effective February 15, 1943.

The same docket and proposal covered rates to Connersville, Indiana, Cleveland, Ohio, Dayton, Ohio, Mansfield, Ohio, Marion, Ohio, and Muskegon, Michigan, but authority for publication of rates to the latter points was not issued at the same time, with authority for publication of the rates to Galesburg and Freeport, Illinois, because, as stated by the L. & N., of the non-concurrance of Illinois Freight and Central Freight Association carriers, however, the concurrance of those carriers was later secured, and [fol. 5040] authority for publication was issued by Southern Freight Association, February 13, 1943, and the rates have been published to take effect April 10, 1943.

On April 29, 1942, I requested publication of rates from Nashville, Tennessee, to Burns City, Indiana; Fort Miflin, Pennsylvania; Hingham, Massachusetts, and Ione Island, New York.

On January 12, 1943, I requested publication of rates to Easton, Pennsylvania.

On January 20, 1943, I requested the publication of rates to Cumberland, Maryland.

Many other requests for rates to specific points have been made, but as previously stated, rates to only thirteen points have been published and it was not until February 20, 1943, that the L. & N. Railroad filed its proposal No. 14013 with the Southern Freight Association, suggesting the establishment of commodity rates from Nashville, Tennessee, to a representative list of destinations in the Official territory, 32 points in all, and this proposal appears on Southern Freight Association Docket 1191, under submittal No. 29552, dated March 2, 1943, and so far no authority has been issued for the publication of the proposed rate.

On September 2, 1942; I asked that competitive rates be established to apply on:

"Boxes, ammunition or shell shipping, wooden, with metal [fol. 5041] tops and bottoms, but not metal lined, minimum weight 34,000 pounds."

It was not until March 8, 1943, that the L. & N. Railroad filed with the Southern Freight Association, its proposal 14022, suggesting the establishment of rates to representative list of destinations in the Official territory, 50 points on the kind, or type, of boxes on which we requested rates on September 2, 1942. This proposal appears on Southern Freight Association Docket No. 1192, submittal 29602, dated March 9, 1943, and has not been acted on and no rates have been published.

One of our manufacturers recently received an invitation to bid on steel automobile truck bodies, delivered at Metuchen, New Jersey.

The rate from Nashville is second class, 85 per cent of first class, $2.10 per hundred pounds, minimum 10,000 pounds.

The competition to be met was at Detroit, Michigan, from which point the rates are: 72 per cent of first class, $1.03, minimum 10,000 pounds; 52 per cent of first class, 74 cents, minimum 20,000 pounds; 37 per cent of first class, 53 cents, minimum 30,000 pounds.

On November 9, 1942, I requested the Nashville lines to establish rates from Nashville to Metuchen, on steel truck bodies on a competitive basis, that is, the same rate per mile from Nashville to Metuchen as in effect from Detroit to [fol. 5042] Metuchen, which would hove made the rates from Nashville minimum 10,000 pounds, $1.37 per hundred pounds; minimum 20,000 pounds, 99 cents per hundred pounds; minimum 30,000 pounds 70 cents per hundred pounds.

It will be noted that the lowest rate, and the only rate, from Nashville, to Metuchen, subject to a minimum of 10,-

000 pounds, is 204 per cent of the highest rate from Detroit to Metuchen, subject to a minimum 10,000 pounds; the rate from Nashville is 284 per cent of the rate from Detroit, subject to a minimum of 20,000 pounds, and 396 per cent of the rate from Detroit, subject to a minimum of 30,000 pounds.

On December 19, 1942, under his file 46164-C, Mr. F. A. Burke, General Freight Agent of the N. C. & St. L. Railway, Nashville, Tennessee, advised me that this matter had been carefully considered, and that he had been unable to develop competitive conditions which would warrant the establishment of the rates sought, and he was, therefore, sorry that he was unable to comply with my request in this instance.

Mr. Burke sent a copy of this letter to Mr. C. D. Quinn, General Freight Agent, L. & N. Railroad, Louisville, Kentucky, referring to his file Den-11348-50, and to Mr. O. S. Blackman, General Freight Agent, T.C. Railway, Nashville, Tennessee, referring to his file 32728019-B, and on December 23, 1942, I received from Mr. Quinn, and on December 31, 1932, I received from Mr. Blackman, advice to the same effect.

[fol. 5043] I, of course, have no way of knowing what investigation these gentlemen made, or how they arrived at their conclusions, but I do know that no representative of any railroad called on me for any information, other than that contained in my letter of November 9, 1942, advising the Nashville lines of the fact that the Nashville manufacturer had to meet Detroit competition and the rates necessary to meet that competition, and no representative of any railroad called on the manufacturer, who had received the invitation to bid on this contract, for any information concerning the competition he had to meet, or the rates necessary to meet such competition.

From my long experience in handling those adjustments that I have referred to, I think it shows conclusively that this situation cannot be handled by piecemeal and individual rates. Those rates are out of line, and the manufacturers have been unable to meet competition for over a year, and still we are without any rates; so that it just cannot be handled by piecemeal.

Coming now to the interests and the activities of the Nashville Freight Bureau in these proceedings.

When the Southern Traffic League adopted its program, March, 1934, I reported to the Board of Directors of the

Nashville Freight Bureau the action of the League, and I was instructed by a unanimous vote of the Board to cooperate to the fullest extent with the League, and others, in the [fol. 5044] effort to secure a revision of the class rates and the application of a uniform classification, to remove the rate barriers between the Southern and the Eastern territory, reflected in the Class Rate Adjustment.

This matter has been discussed at every meeting of the Board of Directors, Nashville Freight Bureau, since March, 1934, and in every annual report to the membership since that date, and there has been no change in these instructions.

Some of our members, particularly druggists and dry goods concerns, the manufacturers of cotton work clothing and shirts, candy and cereals, complain bitterly, and constantly, about the present situation, and about the delay in removing these rate barriers and handicaps.

These concerns ship on class rates and principally in less-carload lots.

Drugs, linoleum, cotton work clothing and shirts, candy and cereal products, in less-carload lots, are uniformly rated in Southern and Official Classification territories, and interterritorially.

Drugs, linoleum, cotton work clothing and shirts, in less-carload lots are rated 70 per cent of first class, but Southern manufacturers and distributors pay 70 per cent of index 139 rates, whereas, the manufacturers and distributors in Official Classification territory pay 70 per cent of index 100 rates.

Candy is rated 57 per cent of first class in Southern and [fol. 5045] Official territories and interterritorially, but the Southern manufacturers pay 57 per cent of index 139 rates, whereas, the manufacturers in Official territory pay 57 per cent of index 100 rates.

A concrete example is in the rates from Nashville, Tennessee, and St. Louis, Missouri, to Evansville, Indiana.

The short line distance, via the Louisville and Nashville Railroad, from St. Louis is 164 miles and from Nashville, via the same railroad, the L. & N., is 156 miles, and the rate on drugs, cotton work clothing and shirts, linoleum, LCL, from Nashville to Evansville is 69 cents and from St. Louis to Evansville is 54 cents.

The Nashville candy manufacturer pays 56 cents, whereas, his competitor at St. Louis, pays 43 cents per hundred points.

The manufacturer of cereal products is confronted with a worse situation. He ships 95 per cent of his products in less carload, and cereal products in less carload, move from Nashville and from Battle Creek, Michigan, where his principle competitor is located, on fourth class rates.

But from Nashville, 4th class is 55 per cent of index 139 rates, whereas, 4th class from Battle Creek is 50 per cent of index 100 rates. The Nashville manufacturer pays 60 cents per hundred pounds, on cereal products in less carloads to Louisville, Kentucky, a distance of 187 miles, and his competitor, at Battle Creek, pays 49 cents per hun- [fol. 5046] dred pounds to Louisville, Kentucky, a distance of 314 miles.

The Nashville shippers cannot compete, at border points in their own territory, with their competitors in Official territory, at the same border points, although the distances from Nashville are substantially less, and the disadvantage rapidly increases as they try to go into the Official Classification territory, beyond the border points.

I, therefore, repeat that there is no foundation for the statements that there is no demand, from business and industry, for the establishment of a parity of class rates and a uniform classification, within the South and between the Southern and Eastern territories, to remove these rate barriers and discriminations.

Many members of the Nashville Freight Bureau ship on carload commodity, or so-called column, rates and on carload and less carload class rates.

We have a vital interest in the rates on many basic commodities or raw materials.

We have had numerous complaints before the Interstate Commerce Commission, involving the rates on coal, logs, lumber, grain and grain products, pig iron and other commodities, and our interests in freight rates is not confined to the class rate adjustment, but we feel that the merchants and manufacturers who ship largely, or even partially, on class rates are just as much entitled to reasonable and non- [fol. 5047] discriminatory rates as those members who ship principally on carload commodity, or so-called column, rates.

Mr. Norman: That concludes your statement, Mr. Henderson?

The Witness: Yes, sir.

Mr. Norman: You may cross examine.

Commr. Aitchison: I am not sure that your statement covered this: You pointed out that in the last, I believe it was, supplemental report in the Southern Class Rate Case, Chairman Eastman indicated that the interterritorial class rate matter ought to be considered after the Official line scale had been made.

The Witness: Yes, sir.

Commr. Aitchison: Well, after that scale had been prescribed in Official territory, there was a further hearing on that, was there not; or, at least, there was a further report?

The Witness: In the Southern Class Rate Case?

Commr. Aitchison: No; in the Eastern case.

The Witness: I don't recall.

Commr. Aitchison: You gentlemen can correct me, if I am in error.

Mr. Eshelman: My recollection is that the supplemental report in the Eastern Class Rate case dealt with a New Jersey situation primarily. My recollection is — was 172, but I can't be sure. However, it would not deal with interterritorial rates to the South.

[fol. 5048] Mr. Grubbs: It dealt with the terminal groups.

Commr. Aitchison: Also, wasn't there an extension of the scale?

Mr. Eshelman: There may be; I am not certain.

Commr. Aitchison: Well, after the Eastern Scale finally was determined by the Commission, what steps were taken by the interests in the South, whom you are speaking for, to have the Southern Class Rate Case reopened, in order to finish the job which Chairman Eastman had indicated should await the disposition of the Eastern scale?

The Witness: Well, I don't recall that there was anything done up to 1934, when the Southern Traffic League undertook to get some revision through the carrier by voluntary action.

Commr. Aitchison: Now, why was that?

The Witness: Well, I just couldn't tell you, Mr. Chairman, why.

Mr. Norman: Well, there wasn't very much time between those two dates, was there?

Mr. Barron: That citation was 171 I. C. C. 481.

Commr. Aitchison: January 13, 1931, was the date of the decision, which made various modifications and findings.

The Witness: I couldn't tell you why it was not done sooner, other than the Southern Traffic League never had money enough to do much. We just had to do the best we could. That was probably the controlling reason.

[fol. 5049] Commr. Aitchison: Well now, passing that and going back to the other question which I indicated, you were active in the traffic work in the South during the period of Federal control?

The Witness: How is that, sir?

Commr. Aitchison: You were active in the Traffic Bureau in the South during the period of Federal control?

The Witness: Yes, sir.

Commr. Aitchison: Do you remember the Director General submitting for consideration to the rate regulatory bodies and the commercial interests certain scales which he proposed and asked for comments on them?

The Witness: Yes; I remember the scale being sent out.

Commr. Aitchison: Do you recall that in the case of the South he suggested two scales, alternatives; one was based on the Southern classification and the other based on an extension of the Western Classification to cover the South?

The Witness: I think that is right, but I don't recall any of the details of the scale.

Commr. Aitchison: Now, I wonder if you happen to know, and if you don't, you just say so, why that suggestion with respect to the extension of the Western Classification to cover the South, and the substitution of the Western Classification for the Southern Classification, met with such disfavor that the Director General dropped the proposition?

The Witness: Well, my recollection of it is that the pro-[illegible] 5050] posal of the Director General would substan[illegible]y increase our class rates.

Commr. Aitchison: That is correct, as I recall it, if I may be permitted to do a little testifying. There was quite a substantial increase in rates, but he later made one anyhow.

The Witness: Well, we couldn't do anything about that. He didn't ask us about that.

Commr. Aitchison: Well, we are looking for light. Now, there was a time when seemingly, barring the matter of the level of the rates, the proposal was made to the South which would have resulted in there being but two classifications resulting in the country instead of three, and my understanding is that there was so much opposition to it that the Director General withdrew the request which he had made to the State Commissions for consideration, and also a request to this Commission for its advice.

The Witness: Well, I think that is correct, but the reason for it, as I say, as I recall it, was that he proposed substantial increases in our Southern rates, although it may have been uniform between the South and the West, we would have been further out of line with the East than we were then. It would have made the relative position with the Eastern territory worse than it was. True, he offered us an equality and a uniform classification with the Western territory, but he made our situation with respect to Official [fol. 5051] territory worse than it would have been and worse than it is now or worse than it was at that time.

Commr. Aitchison: I just wanted whatever explanation you could give for the benefit of the record.

The Witness: That is my recollection of it.

Commr. McConnaughey: Mr. Henderson, you said you wanted the sameness of rates to exist all over the United States, that is, all of the territory involved in this investigation; that is correct, is it?

The Witness: Yes. We are in favor of that.

Commr. McConnaughey: And you want that sameness of all rates to be lower so as to correspond to the present Official territory rates; is that it?

The Witness: Well, we have suggested that, because it was the best thing we could figure out after considering all the scales and constructing a lot of scales. We are more interested or concerned with the parity than we are with the absolute level. Now, we suggested to the Commission the way to bring that about is to apply the Eastern Class Scale. If the Commission thinks that something higher than that is necessary for uniform application, why I don't think we would find any complaint with it; just so it is uniformly applied and covered by uniform classification.

Commr. McConnaghey: And you want that regardless of what the economical effect might be upon industry in the [fol. 5052] country as a whole or upon the carriers?

The Witness: My own opinion is it would be beneficial to industry, particularly in the South.

Commr. McConnaughey: And the carriers?

The Witness: Yes. I think in the long run it would be beneficial to the carriers.

Commr. McConnaughey: That is all.

Commr. Aitchison: Cross-examine.

Mr. Grubbs: I wonder if it would be possible to defer cross-examination of this witness. I ask that only if it meets the convenience of the witness and the Commission.

Mr. Norman: The witness will be available tomorrow, if it is desired.

Commr. Aitchison: Anybody else prepared to cross-examine?

Cross-examination.

By Mr. Barron:

Q. Mr. Henderson, when did this Southeast-Southwest Shippers' Conference get together for the purpose of authorizing your appearing in this case?

A. For what?

Q. For the purpose of appearing in this proceeding.

A. Well, I think the organizational meeting was held in Birmingham in March, 1940. Let me see. I have the exact date here—or April, I believe.

Q. Well, you show on sheet 15 of your statement that there was a meeting at New Orleans.

[fol. 5053] A. That was the second meeting. Their organizational meeting was in Birmingham.

Mr. Norman: That is not his question, I don't think.

Mr. Barron: No.

By Mr. Barron:

Q. I just want to know when they decided to join together in prosecuting this case for the common benefit of the Southwest and the Southeast, as you put it.

A. I didn't say they joined for the benefit of prosecuting it for the benefit of the Southeast and the Southwest. The organizational meeting was/decided to oppose the investigation altogether.

Q. That is the investigation. Now, do you know whether or not there was any meeting of the Southwestern shippers or State Commissions, such as Oklahoma, Texas and Arkansas, with the Southern Governors Committee?

A. You mean, during the pendency of these proceedings?

Q. Yes, sir.

A. Why, I think they had several meetings.

Q. Well, when did you decide that you would join hands with them, if you did join hands with them, in the prosecution of this case?

A. Well, we had already decided to prosecute the case; in fact, we had gotten the Commission to institute an investigation of the class rates within the South and between the South and the East.

[fol. 5054] I understand.

A. The investigation had been instituted at the request of the Southern Traffic League and the Railroad and Public Utilities Commissions. Now, later on the Governors organized their conference and they decided to take charge of the handling of it, and we were very glad to have them do it, and we have joined with them in all their efforts to get it done.

Q. Did that include the Governors of the Southwestern States?

A. Well, originally I think it was just the Governors of the Southern States.

Q. And subsequently the Southwest came in with you; is that right?

A. Well, I am not in a position to say what the Governors did in their organizational meetings. All I know was what was done at the Southern Governors Conference.

Mr. Norman: Mr. McDonald is going to take the stand a little later, and he can explain about that.

Mr. Barron: All right.

Mr. Norman: I don't think Mr. Henderson knows about that.

By Mr. Barron:

Q. Mr. Henderson, you are not speaking here for any Southwestern interests, are you, or the Southeast?

A. No. I am just speaking for the South.

Q. Now, in one of your statements on sheet 19, you say this: "There is, therefore, no foundation for any conclusion, or statement, that these proceedings are the result of politics or that any politics are involved." You are only [fols. 5055-56] making that statement on behalf of the Southern interests, are you not?

A. Yes. I am making that statement because I have shown prior to that that these proceedings were instituted long before the Southern Governors Conference ever was formed.

Q. But you didn't have in mind any interests in the Southwest when you made that statement, did you?

A. No. I am not familiar with politics out there, or what brought it on.

Mr. Barron: All right. Thank you.

By Mr. Real:

Q. Mr. Henderson, since you prepared that *prepared* statement, have you made any study of the exhibit introduced by Dr. Aitchison at this hearing?

A. Since I prepared this?

Q. Yes, sir.

A. No. I just finished this last week.

Q. Would the destination level of freight rates and the destination classifications and exceptions thereto cure the competitive situation that you are complaining of?

A. You mean by "destination" different levels north and southbound?

Q. The destination level of rates and the destination classifications and exceptions.

A. Well, I guess it would.

Mr. Real: Thank you. That is all.

[fol. 5057] The Witness: Because our principal interest is in the northbound rates. It may not be satisfactory to the Eastern interests, though.

Commr. Aithison: Mr. Widell.

By Mr. Widell:

Q. Mr. Henderson, on page 14 of your statement about the Southeast-Southwest Shippers' Conference——

A. Yes, sir.

Q. —you referred there to the discussions and considerations of the question and that over a period of six years there was no dissent from this position.

A. In the Southern Traffic League.

Q. Until the formation of this conference that I speak of. Is it not a fact, Mr. Henderson, that in the Southern Traffic League meetings that antedated the April 5, 1940, meeting of the Southeast-Southwest Shippers' Conference, that there was a lot of difference of opinion regarding the advisability and whether it was to the best interests to Southern industry?

A. There was not, in the meeting of the Southern Traffic League.

Q. You mean that the minutes of the Southern Traffic League will not show that there were opposing votes against this Class Rate investigation?

A. It never was put to a vote until after the March, 1940, meeting in Birmingham.

Q. But if there were dissents, it would appear in the [fol. 5058] minutes of the meeting, wouldn't it?

A. Yes, it would have, but there were not so it doesn't appear in the minutes.

Q. Well, do your minutes of your meetings merely show "passed" without any regard to the number of votes that might have been cast against it?

A. Mr. Widell, there was never any opposition in this proceeding until after the formation of the Southeast-Southwest Conference in 1940. Of course, the thing was discussed from different angles at different times.

Q. You mean then that this conference in April, 1940, just sort of sprung up without any previous consideration of this question?

A. No. I think you called a meeting for the purpose of opposing this investigation. That is my understanding of it. It didn't spring up until you sprung it.

Q. Of course, you understand that I could not form a conference of this kind all by myself, don't you?

A. Well, of course, you had to have somebody there with you.

Q. Now, if the others considered it of enough importance, there must have been some dissenting opinion regarding this in the South prior to April, 1940.

A. Mr. Widell, all of the members of the Southeast-Southwest Conference are not members of the Southern Traffic League, and a lot of them never have been members.

[fol. 5059] Q. And a lot of them have resigned since?

A. Only two.

Q. Only two have resigned from the Southern Traffic League since April, 1940?

A. On account of this investigation, yes—or three.

Q. Three. Who are they?

A. I don't think that is any of your particular business.

Commr. Aitchison: Well, I don't think it is of much interest to us, but we have been washing this linen here for quite a while and possibly the best thing to do is to get it out of your system, but let us not get personal about it.

The Witness: If you want me to answer the question——

Commr. Aitchison: No.

By Mr. Widell:

Q. On page 15 you say "This group has little, if any, interest in class rates or classification ratings." Now, is that just your own personal opinion, or do you know what all the interests of the various groups are?

A. I saw a list of those who attended the organizational meeting in Birmingham and I saw, of course, a list of those who attended the conference in New Orleans, and from the nature of the business I know that most of them are not interested in class rates.

Q. Take the Tennessee Products Corporation which, as you know, is one of the largest industrial concerns in the State of Tennessee, are they not interested in class rates?

[fol. 5060] A. I don't doubt but what they ship some stuff on the class rates, but their major interest, I would say, is in the carload commodity rates, on the raw materials.

Q. Have you made any personal study on the class rates of any of these shippers who are members of the Southeast-Southwest Shippers Conference?

A. No, I have not. I just take it from the nature of their business that their principal interest is in the commodity rates, and class rates are more or less a minor consideration with them.

Q. Now, you were present at the meeting in New Orleans in May, 1940, were you not?

A. Yes; I was there.

Q. And to which you make reference on page 15 of your statement. Is it not a fact, Mr. Henderson, that you and the other members of the Southern Traffic League were favorably disposed to the resolution that you cite here?

A. No; It is not a fact. We are not even a member of that organization. All we did was to agree to submit that to the members of the League, for ~~their vote.~~

Q. Don't you remember that you and Mr. Hart refrained from voting, for reasons that you thought were special for yourselves, and that Mr. Gunn did vote for this?

A. Well, I refrained from voting because I was not a member of the Southeast-Southwest Conference, and I didn't [fol. 5061] see that I had any right on a resolution they offered.

Q. But you know it to be a fact that Mr. Gunn did vote on it favorably, do you not?

A. I think he did; I am not sure, but he was not a member of the organization.

Q. President of the Southern Traffic League?

A. Yes.

Q. And he was at that time?

A. That is right, but he is not a member of the Southeast-Southwest Shippers' Conference; never has been and had no vote coming to him.

Q. In that open meeting, though, he voted for it?

A. Well, he may have. I think he did, but if he was not a member of the organization, he didn't have any business voting.

Mr. Widell: Thank you.

By Mr. McCollester:

Q. After the Commission's decision in the Eastern Class Rate case, do you know whether or not there was a proposal or whether or not the subject was discussed of reopening the Southern case for the purpose of dealing with the interterritorial rates?

A. I don't recall it, if it was.

Q. You don't recall any discussions on the subject with Southern interests who opposed a reopening of the proceeding for the purpose of dealing with the interterritorial rate situation?

[fol. 5062] A. No; I don't. I don't think I was present. If I was, I have forgotten.

Q. Was there any proposal that you recall following the Eastern case for reopening the Southern case, to reconsider the rate situation within the South?

A. None that I am familiar with, except the one I mentioned, where we asked the Southern carriers to revise those rates and then went to the Commission with it. The one I mentioned in my statement was the only one I know.

Q. Was that the time when you went to the Commission and then it was suggested that the interterritorial rates should be brought into it, and then the proposal to revise the Southern rate situation was dropped? Do you recall anything like that?

A. No. In our petition to the Commission we confined it to an investigation of the class rates within the South, for the reasons that I stated.

Q. And you did not go through with that, did you?

A. Well, we are going through with it now.

Q. Well, at that time wasn't it dropped because there was a proposal—I am not sure whether it originated with the Commission or not—that it should be broadened to take in *the interterritorial rates?*

A. Well, it was broadened to take in the interterritorial rates in the beginning.

[fol. 5063] Commr. Aitchison: Well, you don't want to leave the impression that the Commission made any suggestion about what should be done, do you?

The Witness: Well, I don't know where the suggestion came from. I think it came from the Eastern shippers and the Eastern railroads, probably, but our original petition to the Commission was limited to an investigation of the class rates within the South. Now, as I recall it, the petitions were filed by the Eastern shippers and by the Eastern railroads to broaden the issue and include the interterritorial rates.

By Mr. McCollester:

Q. So you now remember that there was a proposal to broaden the inquiry to include the interterritorial rates?

A. I thought you asked me whether we had any proposal like that.

Q. No; I asked you whether there was a proposal.

A. Well, it is stated in my statement——

Commr. Aitchison: He said that in his statement, Mr. McCollester.

The Witness: I said the only proposal that I know of was the one I mentioned in my statement.

Q. When that proposal was made, the Southern shippers withdrew their request for a re-examination of the level within the South, or the rates within the South?

A. No, sir; we did not.

[fol. 5064] Q. Now, Mr. Henderson, on page 19 of your exhibit you have this—which has already been quoted to you on cross examination—statement to the effect that there is no foundation for any conclusion or statement that these proceedings are the result of politics or that any politics are involved. What proceedings have you reference to there when you use the words "these proceedings"?

A. Well, Docket 28,300 and 28,310, that we are considering here.

Q. Well, are you testifying then simply to the effect that the Interstate Commerce Commission has not instituted these proceedings as the result of politics?

A. Well, I don't think I said that the Interstate Commerce Commission—

Q. I don't either, therefore why do you find it necessary to say that the proceedings are not the result of politics?

A. Because the statement has been made that the Governors' action in this case is dictated by politics, and I say it is not. It was started before the Governors got into the case.

Q. Well, what action was started before the Governors got into the case?

A. To bring about an investigation of the class rates within the South, which would add up to these proceedings we have here now.

Q. How far back do you go for the origin then of Docket [fol. 5065] 28,300? Do you go back of the Southern Governors case?

A. Yes. I say that the demand came from the shippers and came in 1934, long before the Governors got into the case, so that there is no foundation for the statement that the Southern Governors started these proceedings or are in them for political reasons.

Commr. Aitchison: Well, I think we have gone just about far enough with politics in this case, and it is about time to drop it.

Mr. McColester: I am satisfied with that, Mr. Commissioner.

Commr. Aitchison: This case is going to be decided on the basis of the record and according to the Commission's best lights, regardless of political considerations.

Mr. McCollester: We certainly feel confident of that, Mr. Commissioner.

Mr. Norman: Your Governors didn't seem to have.

Mr. McCollester: Well, our point——

Commr. Aitchison: Suppose we drop politics. Now, let us quit on that.

Mr. McCollester: Well, he kept on talking about it.

Mr. Norman: I would like to have politics dropped, Mr. Commissioner, from the newspapers and from the Hill, so far as freight rates are concerned, and leave the subject of freight rates to this Commission to decide on the evidence. That is all we ask.

[fol. 5066] Mr. McCollester: Well, you are going to get it.

Commr. Aitchison: Well, that makes it unanimous.

Mr. McCollester: Right.

The Witness: Mr. Chairman, I would like to say since the remark has been made that my reference to politics was not with respect to this Commission but with respect to the Southern Governors wholly. That was what I had in mind.

Commr. Aitchison: I think that is quite clear.

By Mr. McCollester:

Q. Now, Mr. Henderson, you said that Nashville shippers cannot compete at border points in their own territory with their competitors in Official territory. Do you mean to say that Nashville shippers make no shipments to border points and sell no goods at border points where those goods may also be produced in Official territory?

A. Well, in order to do it they have to shrink the profits or make freight allowances. What I had in mind was that they are not an a basis of equal competition in their own territory.

Q. Well, you don't mean that they don't compete, though, do you?

A. Well, they sell some stuff up there; yes.

Mr. McCollester: That is all.

Mr. Grubb: Since everybody else cross examined Mr. Henderson, I will not ask that he come back for me especially, and I will undertake to ask him the questions that I have.

Commr. Aitchison: Go ahead, Mr. Grubbs.

[fol. 5067] By Mr. Grubbs:

Q. Mr. Henderson, I am not sure that I understand the statement on page 5 of your prepared statement. It is the statement that commences on the seven line. You say: "I am the representative of the Nashville Freight Bureau in the activities of the League."

Then you say: "The same is true of a number of other organizations, such as——"

Just what does that mean?

A. Well, that means that the members of the Atlanta Freight Bureau, or the membership of the Atlanta Freight Bureau covers a large number of individual concerns, manufacturers and shippers, just as the Nashville Freight Bureau does; and, the Atlanta Freight Bureau itself is a member of the League. Mr. Hart is the representative of the Atlanta Freight Bureau.

Q. Do you mean to say that you are a representative of the Atlanta Freight Bureau in the activities of the League?

A. Oh, no.

Q. I see.

A. Certainly not.

Q. Now, you talk about steel truck bodies. Who is it that manufactures steel truck bodies at Nashville?

A. Phillips & Burdorff Manufacturing Company.

Q. That concern is normally a manufacturer of stoves, I believe, is it not?

A. Well, that is their principal peace time activity.

[fol. 5068] Q. Yes. And, this manufacturer of truck bodies is incident to the war effort, isn't it?

A. Yes. Nevertheless, they are entitled to get war contracts, I think, on an equal basis with other people.

Q. How many truck bodies are produced per month by this concern?

A. Well, I don't know. The whole job was a million dollar contract; I don't know how many truck bodies.

Q. Isn't it true that this concern received in the latter part of 1942 an order for 1500 truck bodies to go to Metuchen?

A. They made bids on a delivered price and also supplemented it with a bid f.o.b. Nashville. Now, the railroads refused to do anything about the rates. They got the contract on an f.o.b. price at Nashville. The Government ships the truck chassis into Nashville and they put them on the truck and the trucks are driven away.

Q, Yes. Well, first of all didn't this concern obtain a contract in which the Government obligated itself to pay the freight charges?

A. No, sir. They got it on a basis of price f.o.b. Nashville.

Q. It was not provided that they were to move on Government bill of lading?

A. It was not provided for them to move at all. It was an f.o.b. price Nashville. The bodies were attached to the chassis and the Government is driving the trucks away.

[fol. 5069] Commr. Aitchison: Where were these trucks to be delivered to?

The Witness: Methuchen, New Jersey.

Chrmn. Alldredge: The Government drives them away from Nashville to New Jersey?

The Witness: They ship the chassis there and the bodies are attached and driven away. I presume; I don't know.

By Mr. Grubbs:

Q. They drive them all to Methuchen, or not?

A. That is where they asked for the delivered price of the bodies.

Q. Where do the chassis come from?

A. I don't know.

Q. Do you know whether they are all driven away; the complete truck?

A. So far all of them have been.

Q. Do you know how many of them have been driven away?

A. No; I do not, but all that have been completed have been driven away.

Q. Now, the other illustration you gave was ammunition or shell shipping boxes.

A. Yes, sir.

Q. Who is the manufacturer that you have in mind?

A. Well, the manufacturer who received the invitation to bid was another stove manufacturer, Graham & Dudley, but they didn't bid. They didn't have any rates.

[fol. 5070] Q. There isn't any production at present by Graham & Dudley?

A. I don't think they have received a single contract.

Q. Isn't it true that you have a manufacturer in Nashville that ships a great many shell boxes; a manufacturer by the name of A. O. Loveman?

A. Not of the type referred to here, with metal tops and bottoms. He is shipping one type of box.

Q. He is a large shipper, isn't he?

A. Yes, he ships all kinds of boxes.

Q. Aren't those boxes metal lined?

A. Well, the description reads metal lined or not metal lined. I don't think he ships——

Q. Is he a member of your Bureau?

A. No, he is not. I know he is a manufacturer of different kinds of boxes.

Mr. Grubbs: I believe that is all. Thank you.

Commr. Aitchison: Any further cross examination, Mr. Henderson? Any redirect?

Redirect examination.

By Mr. Norman:

Q. Mr. Henderson, you were asked with reference to the failure to take action after the decision in the Eastern Class Rate case prior to 1934, a period of some two and a half years, I believe it was. Was that not during the depths of the depression?

A. I really don't remember, Mr. Norman. I have been in [fol. 5071] the depression longer than that. I have not gotten out of it. I don't recall, Mr. Norman.

Q. Well, I believe the dates are in the record. I think the Commission can take official notice of the fact that that was the depth of the depression, 1931-1934.

A. You may be right about that.

Commr. Aitchison: Well, I was going to suggest, by reason of Mr. Henderson's long experience, when times are tight and we have a depression on, and the shippers are skating close to the margin of failure, isn't that the time that they look more closely to questions of rate advantage in their behalf or against them?

The Witness: Yes; that is generally true, I think.

Commr. Aitchison: You would expect that they would be most keen along about that time, if that was the depth of the depression?

The Witness: Well, at that time and during that period they didn't have any money to put up to finance a big rate case.

Commr. Aitchison: Well, did they even ask the Commission to reopen, inasmuch as the investigation was one which the Commision had instituted?

The Witness: Well, as I said before, frankly, I don't know why it was not taken up sooner, except one reason was that we didn't have enough money to finance that investigation [fol. 5072] and we didn't want to start one unless we could go through with it.

Commr. Aitchison: I simply want to know why it was that there was apparently that wide period in there from the time of the decision in 171 I. C. C., until the first of these meetings that you have described.

The Witness: Frankly, I just don't know. I couldn't tell you.

Mr. Norman: May Mr. Henderson be excused?

Commr. Aitchison: Yes. You are excused.

(Witness excused.)

Mr. Norman: I will call Mr. Weaver.

O. H. Weaver, was sworn as a witness and testified as follows:

Direct examination.

By Mr. Norman:

Q. Please give us your name and address.

A. O. H. Weaver, Griffin, Georgia.

Q. What is your business, Mr. Weaver?

A. I am an industrial traffic manager representing a group of shippers in Georgia and Florida, which is the Georgia Canners Association. The Georgia Canners Association membership consists of all the fruit and vegetable canneries in the State of Georgia.

Q. You have heard the testimony of Mr. Henderson with reference to the support of industry, for the demand here for a revision of class rates, and I will ask you to state what [fol. 5073] is the position of the Georgia Canners Association in that matter?

A. We are very much interested in this proceeding and have so stated our position to the railroads for a great many years.

Q. Have you been making efforts for years to secure a parity of freight rates into Official territory with those obtaining in Official territory?

A. Yes, sir, but I have not been as fortunate as Mr. Henderson. I have never been able to get my proposal on the docket of the Southern Freight Associatioin. I could not get any further than the general offices of the Southern Railroads.

Mr. Norman: I believe that is all. You may ask him.
Commr. Aitchison: Cross-examine.

Cross-examination.

By Mr. McCollester.

Q. Why didn't you testify here at the Indianapolis hearing?

A. Because it was our intention to file a formal complaint with this Commission at the close of this investigation attacking our canned goods rates to Official territory, but we learned that certain witnesses testifying in this proceeding made the statement that industry as a whole, in the South, was not in sympathy with this proceeding. We didn't think it would be fair to the Commission or to us not to come here today and tell you that we are not satisfied with our adjustment.

Q. Well, are we to infer from that statement that the reason that you did not testify at the first hearing in this [fol. 5074] proceeding, when the complaining shippers testified, that the rates on which you ship are not rates that are involved in this proceeding?

A. Our commodities move on a column basis, but any change—at least, we believe that any change in your class rate scale will affect those column rates.

Q. But you do not consider, that your rates are involved in this particular proceeding?

A. Yes, I do, because if they are related to the first class rate and you change that scale, it will ultimately affect the column rates.

Q. Then why didn't you come before the Commission when the Southern interests presented their case in chief and testify?

A. Because as I stated before, we fully intended to file a formal complaint on canned goods only.

Q. Why do you propose to file a formal complaint on canned goods rather than await the outcome of this investigation?

A. Well, I said that we would file that at the conclusion of this investigation. If relief is not granted in this proceeding, then we will file a formal complaint.

Q. Well, were you informed, as the reason for a formal complaint, that your rates are not involved in this proceeding?

A. No; I was not informed that my rates were not involved.

Q. What sort of canned goods do you ship, or the members of your association?

[fol. 5075] A. What canned goods are shipped?

A. Yes.

A. Asparagus, green beans, tomatoes, peas, turnip greens, spinach, okra, okra and tomatoes, pork and beans, sweet potatoes, peaches, blueberries, pears, blackberries and pimentoes.

Commr. Aitchicon: It sounds like an OPA order.

By Mr. McCollester:

Q. What territory do you ship to?

A. We ship 75 per cent of our canned fruits and vegetables to Southern territory.

Q. Where do you ship the remaining 25 per cent?

A. We ship to the Far West to Western Trunk Line territory, to the Southwest and Official classification territory.

Q. In other words, you ship all over the country?

A. Yes.

Mr. McCollester: That is all.

Commr. Aitchison: Any further cross-examination? You are excused, Mr. Weaver.

(Witness excused.)

Mr. Norman: Mr. Commissioner, as I stated, Mr. Hart's exhibits have not come, and my other two witnesses won't be here until the morning, so if anybody can use up these 15 minutes, it would be very agreeable to me.

Commr. Aitchison: Was anyone desiring to cross-examine Dr. Duncan and had reserved that privilege? I had forgotten. Was there, Mr. Bell?

[fol. 5076] Mr. Bell: I had understood that Dr. Duncan had been excused.

Mr. Smelker: There was still cross-examination of Mr. Heywood and Mr. Carpi.

Commr. Aitchison: Is anybody else prepared to examine either of those gentlemen?

Mr. Smelker: I have no cross-examination.

Mr. McCollester: I would like to ask Mr. Heywood a couple of questions.

Mr. Norman: I do too, but it is not in the nature of cross-examination.

Mr. McCollester: I don't know whether mine is or not.

Commr. Aitchison: Let Mr. Heywood come forward, if he is here. Mr. McCollester, you want him too?

Mr. McCollester: Yes. I have just a couple of questions.

J. L. Heywood, previously sworn, recalled and testified further as follows:

Cross-examination.

By Mr. McCollester.

Q. Mr. Heywood, would you please refer to your Exhibit No. 215, and particularly page 6 of that exhibit. Are we to understand that you, as an accounting official, approve or disapprove or express no view as to the method used by Dr. Edwards in arriving at his computed costs and his figures which you have cited on your sheet of value?

A. I express no views as to his costs.

[fol. 5077] Q. So that these figures here are not offered by you as your views of the true or the base costs?

A. No, sir.

Q. I am not sure that I understood just what you did in the bottom section of that exhibit, but will you look at the middle section on page 6 of the exhibit? I notice, looking across your last two columns, headed "Southern Region Cost per 100 pounds for 300 miles," and then the next one is "Southern Region Cost,"—is the last one the total and the first one divided by the number of tons? I am looking at the middle section.

A. You are speaking of the last two columns?

A. Yes.

A. That is the rate multiplied by the load.

Q. Now, looking at the bottom section there are two headings that I do not understand. The first heading is "Southern Region Cost per Ton, 300 Miles" and then if you will skip over to the third column from that, the heading is "Southern Region Average Cost per Ton at Southern Region Composition." I notice that the figure 3.24 appears in both of those columns.

A. Yes, sir.

Q. What is the difference otherwise between those two columns?

A. The column "Southern Region Average Cost per Ton at Southern Region Composition" is the result of applying the average shown under the first column there under "Composition of Tariff, Five Years, 1937 to 1941." [fol. 5078] Those percentages there of composition are gondola and hopper cars as compared with all other carloads, and apply to the rates in the first column. Likewise, taking the next subject, "Eastern District Including Pocahontas" is also applied to those rates to get the Southern on the basis of the composition of the East, or the South.

Q. Then I will ask you, should we understand that the difference between the left-hand column, which has the figures 2.55, 3.97 and 3.24, and the third column to the right from that, the figures 1.32, 1.92 and 3.24—is the difference between the five-year period and the one-year period; the left-hand being the one-year period?

A. That is true. One is five years. You must give consideration that that is on the composition of the traffic for a five-year period 1937 to 1941, to bring it up to a more current date than Mr. Kennedy left when he put the 10-year period in for 1939. This is exactly the same as Mr. Kennedy's Exhibit 181, only that we have brought it up to the more current five-year period as compared with his ending in 1939 for the 10-year period.

Q. I see. Does this fairly state, based on the five-year period, what your exhibit is designed to show, that because of the difference in the ratio of gondola and hopper cars to all cars in Official territory and in Southern territory, if the Official ratio had been applied to the South, the southern [fol. 5079] cost be lower than that computed by Dr. Edwards?

A. It really is applied here to the southern costs.

Q. And it produces a lower cost than the southern actual ratio of gondolas?

A. I will say this five-year period shows a lower cost for the southern than Mr. Kennedy did for the 10-year period.

Q. But both yours and Mr. Kennedy's show that applying the official ratio of gondolas and hoppers to all types of equipment would lower the southern costs computed on Dr. Edwards' formula, or have I just got that wrong?

A. I don't — as I want to agree exactly with your statement there.

Mr. McCollester: All right. I won't try any more.

Redirect examination.

By Mr. Norman:

Q. Mr. Heywood, as I understand it, you have taken the five-year period ending in 1941 and have included Pocahontas with Official territory; is that right?

A. That is correct, on sheet 6.

Q. On sheet 6.

A. On sheet 7 Pocahontas has been deleted.

Q. And you find, with Pocahontas included for that period, the cost in the South was 98.2 per cent of the cost in Official territory; is that right?

A. That the South cost, yes, is 98.2.

Q. And if you exclude Pocahontas from Official, it would be 91.3?

[fol. 5080] A. That is right.

Q. Now, you said in your testimony you were recasting Mr. Kennedy's testimony. Do you use the same methods of calculation as Mr. Kennedy did? Is that what you mean by that?

A. The same methods were used; yes.

Mr. Norman: That is all.

Recross-examination.

By Mr. McCollester:

Q. Mr. Norman asked you if the result would show the South's cost 98 per cent of Official's costs. You are not offering this explanation——

A. This is simply to show the five-year period, as I said before, current years, with Mr. Kennedy's comparison.

Mr. Norman: And the purpose of that was to show that the South was improving as time went on; is that it?

The Witness: I simply put it here to show you when we get more current data, the story is not the same as Mr. Kennedy showed.

By Mr. Eshelman:

Q. When you say the same method was used as by Mr. Kennedy for consist of traffic, isn't it correct to say there was a use of tons—or, rather, of the consist of traffic as developed in one of Dr. Edwards' exhibits?

A. In his later appendix A. I assume Mr. Norman meant the mathematical method.

Mr. Norman: That is what I did mean.

The Witness: That is what I answered the question on.

[fol. 5081] Commr. Aitchison: Any further examination of Mr. Heywood at this time?

Mr. Smelker: I believe the record shows that his exhibits 215 and 216 are not in.

Mr. Eshelman: Then we ask that they be received.

Commr. Aitchison: Exhibit 216 was received, but not 215. The Commission said it was received, and then retracted that when Mr. Grubbs reserved the right to object. Do you object?

Mr. Grubbs: No objection.

Commr. Aitchison: Exhibit 215 will be received.

(Exhibit No. 215, Witness Heywood, received in evidence.)

Commr. Aitchison: If there is nothing further, Mr. Heywood, you are excused.

(Witness excused.)

Commr. Aitchison: Now, there was another witness to be cross examined.

Mr. Eshelman: Mr. Carpi was to be cross examined.

Commr. Aitchison: Cross examination of Mr. Carpi was reserved. Does anyone desire to ask him any question?

If no one desires to cross examine you, Mr. Carpi, you may be excused.

Mr. Smelker: I believe Exhibit 217 was held up.

Commr. Aitchison: Without objection Exhibit 217 is received.

[fol. 5082] (Exhibit No. 217, Witness Carpi, received in evidence.)

Commr. Aitchison: Any thing further this afternoon? If now, we will suspend until 9:30 in the morning.

(Thereupon at 4:30 o'clock p.m. an adjournment was taken until Wednesday, March 31, 1943, at 9:30 o'clock a.m.)

[fol. 5083] BEFORE THE INTERSTATE COMMERCE COMMISSION

Docket No. 28300

Class Rate Investigation 1939

Docket No. 28310

Consolidated Freight Classification

Main Hearing Room, Interstate Commerce Commission Building, Washington, D. C.

Wednesday, March 31, 1943.

Met, Pursuant to adjournment, at 9:30 o'clock a.m.

Before: Division 2 of the Commission

Hon. Clyde B. Aitchison (Presiding); Hon. J. Haden Alldredge (Chairman of the Commission), Hon. Walter M. Splawn, and a Cooperating Committee of the National Association of Railway and Utilities Commissioners, represented by: Mr. W. H. Scott, of The Public Service Commission of South Carolina; Mr. George McConnaughey, Public Utilities Commission of Ohio; Mr. C. L. Doherty, South Dakota Public Utilities Commission.

Present: Paul O. Carter, Examiner; W. J. Koebel, Ex- [fols. 5084-5084a] aminer; T. L. Haden, Examiner. W. U. Hardie, Director, Bureau of Traffic. J. J. Murphy, Consultant.

Appearances: (As heretofore noted.)

Additional Appearances: Wilbur LaRoe, Jr., Investment Building, Washington, D. C., appearing for Southern Paper Manufacturers Traffic Conference. Thomas E. Grady, 504

Ingraham Building, P. O. Box 2468, Miami, Florida, appearing for Greater Miami Traffic Association.

[fol. 5085] **Proceedings**

Commr. Aitchison: You may proceed.

Mr. LaRoe: If Your Honor please, it has been agreed that I may make a one-minute statement on behalf of Southern Paper Manufacturers Conference, with your approval:

Statement by Mr. Wilbur LaRoe, Jr.

At pages 3856 and 3857 of the record Mr. Oliver, I am sure quite unwittingly, testified that the Southern Paper Industry voluntarily agreed to 110 per cent basis to the North. In the record in that case, which was I. & S. 4413, the principal witness for the paper industry, Mr. C. E. Jones, said, "We also sought this same mile for mile parity to points beyond in Official territory but were unable to obtain the same by voluntary agreement."

It was clear throughout that proceeding that the carriers on paper maintained the 100 per cent level of rates to the Ohio River crossings, and our witnesses therein contended in view of that fact that there would be no justification for a higher basis to the points north.

Thank you very much.

Commr. Aitchison: Whom do we hear next?

Mr. Hollopeter: If the Commissioner please, I have a witness on behalf of Governor Shricker, who is ready to go on this morning.

Commr. Aitchison: We will be glad to hear him.

[fol. 5086] George N. Beamer, was sworn as a witness and testified as follows:

Direct examination:

By Mr. Hollopeter:

Q. Will you state your name for the reporter?

A. George N. Beamer.

Q. Where do you reside?

A. At South Bend, Indiana, and temporarily at Indianapolis.

Q. Do you appear here on behalf of Governor Schricker of Indiana?

A. I do.

Q. Are you connected with the State Government of Indiana at this time?

A. I am.

Q. In what capacity?

A. I am at present Chairman ~~of~~ the Public Service Commission of Indiana.

Q. Have you had previous connection with the State Government?

A. Yes. For two years immediately preceding I was Attorney General of Indiana.

Q. Are you familiar with the Governor's statement which you are going to present, to the extent that you could adopt that for your own testimony in this case?

A. Yes, I am.

Q. Will you proceed then to present the statement for the [fol. 5087] Governor, please?

A. This is the statement of Governor Henry F. Schricker of Indiana.

Mr. Norman: Mr. Commissioner, I do not object really to the statement but I think it ought to be the statement of the witness.

The Witness: I am perfectly willing to adopt it as my statement.

Mr. Hollopeter: He justified to that, Mr. Norman.

Mr. Norman: Then he proceeds to say it is the statement of Governor Schricker.

The Witness: It will not be my purpose here to discuss the technical and involved question of freight rates. I shall leave that to the experts who are able to weigh and evaluate all pertinent factors. I want to say, however, that I appreciate this opportunity to submit to this honorable body this statement on behalf of the great State of Indiana. Since the Governors of some of our sister States have appeared in this proceeding to submit statements on certain economic questions as affecting their respective States, I feel that some statement from our section of the country should be helpful.

I shall present here what may be termed Indiana's side of a complex, economic and transportation problem. I assume that the Governor of any State has so many weighty problems of government pressing for his time that it is [fol. 5088] impossible for him to arrive at any unbiased or judicial determination of all the varied and involved technical angles of freight rates as they are involved here. I have found that to be true in my case and I freely concede the propriety of having a technically trained body of experts such as the Interstate Commerce Commission to carefully consider and evaluate all the facts which all of us may present on all sides and features of this problem.

First, I should desire most emphatically to state that the people of Indiana desire in this controversy only complete fairness and justice based on all the facts and conditions that are involved or have a proper bearing on this freight rate problem. Desiring that for ourselves we just as ardently desire to see exactly the same fairness and justice given to the people of each and every other State and section of the country.

I believe there is a common ground for the establishment of such fairness and justice in this problem and again recognizing the complexity of it, I think that we should all rely explicity on the fairness and integrity of the Interstate Commerce Commission and the orderly process through which we have always obtained justice in this country rather than attempt to stir up passions and prejudices in the various sections of the country on a question that is so technical and involved that it is impossible for the laymen to grasp the significance of the various parts thereof and consequently unable to reach a fair conclusion.

[fol. 5089] From the statements I have observed from various representatives of other sections on this question, I am thoroughly convinced there are two sides to this freight rate problem which should be plainly evident to anyone who is in a position to view the matter with a completely open mind.

Indiana and her surrounding States have their economic problems. Knowing them intimately it is not surprising to me that they are very similar in many respects to most of the problems discussed by the representatives of other States. We recognize the definite effect which freight rates can have on the prosperity and well-being of any State or section of the country. We have in Indiana, as I am sure prevails in almost every other State also, a very grave and serious readjustment problem in our economics when this war is over which we all earnestly hope and pray will be soon.

This, however, only emphasizes the fact that all pertinent evidence on all sides of this problem should be clearly presented to the Commission and then let the Commission be free to reach its just and proper decisions, unhampered by sectional prejudices and passion as they have sometimes been displayed in the press and through other channels.

While as I have previous stated, I have no personal or technical knowledge of freight rates, my information is that there are many instances where the freight rate of a given article for a given distance in Indiana or the surrounding [fol. 5090] States is higher than the corresponding rate in various other sections of the country.

Mr. Norman: I woud like to ask right there if the witness adopts that statement as his own.

Mr. Hollopeter: He says it is his information.

The Witness: Yes, I adopt that.

Mr. Norman: But you have no technical information as to rate matters.

The Witness: No, not personal.

Mr. Norman: All right.

The Witness: I understand further that there are other situations where the reverse of this is true. That is also my information.

I am not in a position to develop or discuss the propriety or impropriety of any of these specific illustrations but from a purely academic standpoint it seems that it must follow, that in any fair and proper pricing of transportation service it ought to be done in a way that would best serve the needs of commerce and industry in the various sections of the country and at the same time to properly maintain sound and healthy transportation facilities.

As the needs of these objectives differ greatly in the different sections of the country it would seem that it would not necessarily follow that any serious fault must lie in the rates structure, merely because of these different [fol. 5091] levels of freight rates. The fault can exist only, it seems, if or when it should be found that these offsetting advantages and disadvantages are not equally or properly balanced. That, of course, again gets back to the judicial question which the Commission alone should determine in light of all the facts.

I would like, therefore, to submit to this honorable body several facts of economic importance that exist with respect to conditions in Indiana.

But a relatively few years ago my State of Indiana was the home of a number of thriving and prosperous manufacturers of pulpboard made from straw, a prevalent raw material in Indiana. This industry provided much employment and produced much of value in the normal commerce at that time. Today practically all of these plants have disappeared from the State. We have only ruins in many places to mark the location of the operations. They disappeared because of the development of the production of board, probably of a better quality, and certainly more economical, from woodpulp produced largely in the South and Southwest.

The disappearance of these operations not only disturbed the labor situation but in many respects affected definitely the revenues of the State through the loss of taxes formerly received from the valuation of the properties. It is not my purpose to indicate that Indiana has any complaint on this situation for we look upon it as one of the natural developments in the country as a whole which become of importance [fol. 5092] to all of us.

It does seem to one uninformed in the technicalities of freight rates that it indicates that not all that has been said elsewhere about the freight rate situation can possibly be true for it certainly did not protect Indiana in the enjoyment of this industry and while it was disappearing in Indiana it was developing to a greatly magnified degree in the South and Southwest.

Another great and important industry in Indiana has been the production, processing and marketing of a building limestone of which the State has an almost unlimited supply and a quality that we are proud to say does not seem to be surpassed anywhere else in the country. That industry has been almost dormant in Indiana in recent years.

My information is that pro-cers of limestone in States to the south of us have often been able to ship their product, directly past Indiana sometimes even into Canada, where I have been informed they have undersold our Indiana producers. This again is not a complaint on the part of Indiana nor a suggestion that the rates are out of line or unfair to us. I am simply reciting this to show the economic situation and it appears to me here that the rates, whatever they may be, are not so favorable to Indiana and so unfavorable to other sections as to protect Indiana unduly in this instance.

[fol. 5093] We also had, in years past, many thriving and prosperous manufacturers of furniture in Indiana. That industry has very definitely been on a decline in the past 15 years and with its decline in Indiana, we observe much expansion in the same industry in the South and Southwest. I do not contend that freight rates alone are the cause of this and again this is not a complaint against the rate situation. I am simply stating the economic fact that the furniture industry in Indiana has not been prosperous and is getting less and less prosperous each year.

I have been informed that whereas we formerly produced much furniture in Indiana, that now most of the furniture sold in Indiana in retail is produced in the South and Southwest. It is reported to me that these manufacturers in these territories normally undersell Indiana manufacturere very frequently in their home markets as well as elsewhere in the country. At least the freight rates have not prevented this desirable improvement in the Southern industry nor has it prevented the very undesirable recession of the same industry in Indiana.

I would call attention to one more industry which formerly thrived and was very prosperous in Indiana, that is the manufacture of heating and cooking stoves.

Without going into the details the story of the Indiana stove industry is precisely the same as that of the furniture, stone and the strawboard industries. The operations [fol. 5094] of these four substantial lines of industry which seem to have been generally lost to Indiana has brought upon us serious implications in the way of disturbance to labor and financial loss.

I do not appear here in the position of blaming any other territory or States who have been more fortunate than we in benefiting by the development of these industries coincidentally with their decline in Indiana. I look upon this as one of our economic problems which we must solve and I have generally found that we can solve our problems more satisfactorily by attacking them directly than by heaping blame and censure on others. I do want to leave with the Commission the facts that Indiana and its surrounding States have not been wholly prosperous nor as successful with their industrial activities as we should have liked to have been.

Because of the serious post-war readjustment that is sure to come, if the Commission shall find readjustments in these rates to be proper as a result of this proceeding we urge that they as carefully weigh the effect of such readjusted rates on our economics, as they should weigh the effect of the present rates on the economics of those sections complaining thereof.

May I again reiterate that being one of the forty-eight States of this great nation, we desire no unfair treatment in freight rates or otherwise imposed upon any of our sister States and likewise we ask no advantage whatever over any of them, but we do insist that complete justice be given to [fol. 5095] all with respect to the entire freight rate structure which so definitely affects the economy of every State.

Our experts in transportation matters, I am sure, will give you the details that should enable you to treat all fairly and equitably and we rely upon the continued integrity of this Commission in determining these issues without fear or favor and upon the facts properly submitted without regard to any other influences.

Q. Have you personally had occasion to confer, together with Governor Schricker, with responsible representatives of the stone, the stove and the furniture industry in Indiana?

A. I have.

Q. And is that the basis for the statement you have made with regard to those industries?

A. That is correct.

Mr. Hollopeter: I believe that is all we have, sir.

Mr. Norman: Just a question or two.

Cross-examination.

By Mr. Norman:

Q. Mr. Beamer, on page 3 of the absentee Governor's statement with reference to furniture it is stated, "I do not contend that freight rates alone are the cause of this."

Do you contend that freight rates are even a contributing cause?

A. I don't recall exactly how that statement was used, [fol. 5096] I mean in reference to the other. You mean because of the dislocation from the North and the increase in the South?

Q. That is right. I take it that is what he is talking about.

A. I don't know that that is a contributing factor.

I do know, of course, that the southern manufacturers are able to undersell the northern manufacturers right in our local community.

For instance, in Indianapolis a manufacturer informs me that southern manufacturers can undersell him on the same furniture right in Indianapolis where he is located.

Q. Inasmuch as he pays no freight rate at all the freight rates can't be a contributing factor, could they?

A. I would think not, not in that particular instance.

Q. Do you claim that there has been any unfairness to Indiana in the freight rate structure as it exists?

A. No, there is no contention that there has been.

Q. And you don't contend that the decline of any one of these four industries you have referred to has been due to any unfair adjustment on freight rates?

A. No, I simply make the point the industry has declined in Indiana, even though other sections of the country claim we have advantages in freight rates.

The freight rate advantage which we may have, if any, has not kept these industries from seeking their natural advantages.

Q. In other words the tariff is not high enough?

[fol. 5097] A. No, we don't contend that.

Mr. Norman: That is all.

Commr. Aitchison: The rates on stoves and on stone have both been pretty thoroughly investigated by this Commission, you may recall, don't you?

The Witness: I don't know about that personally, no.

The only points we were attempting to make were that if there is any advantage in the stone, so far as Indiana is concerned, they can still undersell us in markets further to the north.

Chrmn. Alldredge: Well, I don't want to pursue the inquiry, but it is a fact, isn't it, that Indiana produces the stone that also ships into the South?

The Witness: I don't know. I presume on occasion they do. We think we have a better quality than anybody else.

Mr. Norman: You have almost a monopoly in the Washington market, haven't you?

The Witness: I don't know. We have had some pretty good representation down here. We have been pretty good salesmen upon occasion, but I don't know that it has been true in recent years.

Commr. Aitchison: I think we ought to have an understanding that Mr. Hollopeter probably recalls we did deal with this Bedford stone case at very great length. I remember the agony we had in conference over it.

[fol. 5098] The Witness: I think we should make it clear we are not complaining about the situation.

Commr. Aitchison: I am simply trying to show those rates have been pretty well fixed, and of course stoves were in the Southern Governors' Case.

Mr. Hollopeter: We agree with you that they have been fixed. I don't know that we can go all the way, but the purpose of the Governor's statement here was simply to show, as the witness has stated, that whatever the rate adjustment has been it has not been responsible or has not protected Indiana unduly in the maintenance of these industries, and he doesn't attempt to make any complaint, and that doesn't mean, I think, that he admits the rates are entirely proper. I don't want that to appear that way.

Commr. Aitchison: And I take it also there isn't much question but what the stone and stoves at least move on commodity rates, rather than on class rates.

Mr. Hollopeter: Yes, I think the Governor didn't attempt to go into that. He simply conferred with the industry.

Commr. Aitchison: I am wondering as to whether the stone and stoves move on——

Mr. Hollopeter (interposing): The stone moves on commodity rates and the stoves I believe are on a percentage class which are perhaps considered commodity.

Commr. Aitchison: And how about furniture in Official [fol. 5099] territory?

Mr. Hollopeter: Furniture is largely commodity—no, it is a class, I should say.

Commr. Aitchison: And from the South?

Mr. Hollopeter: That is on a class basis but it has been fixed by the Commission some years ago.

Commr. Aitchison: In both territories?

Mr. Hollopeter: Yes, in the general furniture case, perhaps 10 or 15 years ago.

That is all we have for Indiana, your Honor.

Commr. Aitchison: You may be excused.

(Witness excused.)

Commr. Aitchison: Mr. Norman, are you ready to go ahead?

Mr. Norman: Mr. Hillyer has a witness from Florida he would like to put on now.

Commr. Aitchison: Proceed, Mr. Hillyer.

T. C. Maurer, previously sworn, recalled and testified further as follows:

Direct examination.

By Mr. Hillyer:

Q. Mr. Maurer, in the testimony of Mr. Wolford for the Seaboard Air Line Railway, he points, with perhaps pardonable pride, to the fact that some 67 new industries have been located in the Southeast on the Seaboard Air Line Railway during the years 1939 to 1941.

I want to inquire as to these products, whether they move [fol. 5100] on class or commodity rates generally, and generally in what territories:

The products of sawmills, what rates do the products of sawmills take?

A. They take commodity rates as a general rule, and move in Southern territory.

Q. Planing mills?

A. Commodity rates.

Q. Building supplies?

A. They, for the most part, are commodity rates.

Q. Do building supplies ordinarily move from the Jacksonville area into the northern States?

A. No, sir; that is a local proposition.

Q. What type of rates are charged on products of crate mills?

A. Commodity rate.

Commr. Scott: What kind of mills?

Mr. Hillyer: Crate mills—c-r-a-t-e.

Q. Do crate materials take the lumber rates?

A. Yes, sir, they do.

Q. Is that true also of barrel staves?

A. Yes, sir.

Q. Where are the products of the crate mills in the Southeast distributed?

A. Generally speaking, in the local territory for the fruit and vegetable industry.

[fol. 5101] Q. Next Mr. Wolford mentions sulphite pulp. What basis of rate is used for sulphite pulp?

A. Sulphite pulp is manufactured at one pulp mill point in Southern territory Sulphate pulp is manufactured pretty generally at all the paper manufacturing points.

That commodity moves generally into Official territory. However, on wood pulp today there are only one or two through rates. The balance of the rates are based on either Ohio River transportation in traffic moving into Central territory, or Virginia cities combination on traffic moving into Eastern territory.

In other words we have been attempting to obtain a through basis of rates on wood pulp comparable to the level of rates in effect in Official territory for some years, but have been unsuccessful up to this time, although I must say that there is a proposal now before the Official lines seeking to publish a through line of rates.

Q. Where is the sulphite pulp mill located?

A. At Fernandina, Florida.

Q. Isn't there one in Jacksonville?

A. Yes, sir.

Q. Are you the regularly employed traffic manager for that mill?

A. I am, yes, sir.

Q. Is sulphate pulp a finished product sold for consump-
[fol. 5102] tion or is it a product used for further assembly or manufacture?

A. It is a raw material and of course has no use in its state as pulp. It is converted into paper either by direct use of the pulp or mixing it with other materials such as scrap paper and scrap board and things of that nature.

Q. What basis of rates is applied to sulphate of alumina?

A. Sulphate of alumina is another commodity that moves locally within Official territory. Another name for it commonly is papermakers' alum and is used quite extensively in the paper industry.

It moves on exceptions to class rates, and the movement within the South, that is the movement is more or less confined to points within the South, and does not move from the South to Official territory as a general proposition, although there may be some sporadic movements.

It is also used in the purification of water and moves locally from such points as East Point, Georgia to Carolina cities for use in their water supply.

Q. From your knowledge of these industries in your section will you say that these are war industries or are permanently or established industries?

A. I would say they are all stable and permanent industries. They are not war industries.

Q. Do any of the products of these 67 new industries that you know of move generally at class rates from the South into the North?

[fol. 5103] A. No, sir, I can't see any that do.

Q. For a number of years were you employed by the Florida East Coast Railway?

A. Yes, sir, I was.

Q. In the Traffic Department?

A. Yes, sir.

Q. Did you hear the testimony of Mr. Parsons yesterday?

A. I did, yes, sir.

Q. You are familiar with the fact that the Florida East Coast has to meet the competition of direct coastwise steamship lines, intercoastal waterways, trucks and the Seaboard Air Line Railway?

A. That is correct, yes, sir.

Q. What is the basis of the first class and other class rates between Jacksonville and Miami, the main termini of the Florida East Coast?

Commr. Aitchison: Intrastate, you mean?

Mr. Hillyer: Yes, intra or inter.

A. Intrastate the rates are very much lower than the K-2 scale. Interstate they would be on the basis of the K-2 plus L-4, 13494 scales.

By Mr. Hillyer:

Q. The interstate would only apply in the nature of proportional rates on business coming from beyond?

A. Yes, sir, that is correct.

[fol. 5104] Q. In your opinion would it be practicable for the Florida East Coast Railway to maintain the Florida arbitraries in addition to the K-2 scale on its traffic between Jacksonville and Miami?

A. As to competitive points I would say it would be impossible, impracticable to do that, and especially to do so at non-competitive points, but there again you have the competition with water and truck lines that would, I believe, make it impossible to maintain anything approaching the level of the K-2, L-2 scale.

Q. Do the truck lines of Florida maintain class rates including the L-2 arbitraries on interstate or intrastate movement?

A. No, sir.

Mr. Hillyer: That is all on direct.
Commr. Aitchison: Cross examine.

Cross-examination.

By Mr. Norman:

Q. Prior to the discontinuance of operation by the coastwise lines did wood pulp move in very considerable volume by water from the South to the North?

A. Just to the North Atlantic ports.

The large movement from the South to the North by water would be wood pulp board; that is a step further along in board manufacture than wood pulp.

Probably the largest movements from the South (and when I say the South I speak of the southern paper manu-[fol. 5105] facturing points), probably the largest movement would be to such points as Chicago, Chillicothe, Canton, and points like that, where the wood pulp is prepared for some type of paper or board.

Q. Have you undertaken in your statement to deal with all of the 67 industries which Mr. Wolford enumerated?

A. No, sir, and I merely commented on those that Mr. Hillyer talked about.

Mr. Norman: That is all.

Mr. Hillyer: That is all.

Commr. Aitchison: You are excused.

(Witness excused.)

[fol. 5106] Mr. Norman: If the Division please, Mr. Walter McDonald has a statement he wishes to make on behalf of Southern Public Service Commissions.

Commr. Aitchison: We will be glad to hear him. Is this a statement in the nature of testimony?

Mr. Norman: Yes, it is in the nature of testimony.

Commr. Aitchison: Have you been sworn, Mr. McDonald?

Mr. McDonald: I have not, sir.

Walter R. McDonald, was sworn as a witness and testified as follows:

Direct examination.

The Witness: Mr. Chairman, my name is Walter R. McDonald. I have been a member of the Georgia Public Service Commission since January 1, 1923, with the exception of two years that I was prevented from serving by reason of an Executive Order, and was reelected again during that time I was out. I have been Chairman of the Commission since August, 1937.

My official residence is in Atlanta, of course, and by reason of that pivotal location my fellow Commissioners in the South have kept me in the position of President of the Southeastern Association of Railroads and Utilities Commissioners, a voluntary organization of State Commissions made up for the purpose of joint and cooperative action in rate matters of common interest to all the members of the associations, and it is made up of the Commissions of the States of Alabama, Florida, Georgia, Louisiana, Mississippi, North [fol. 5107] Carolina, South Carolina, Tennessee, Kentucky and Virginia.

I am here today speaking for all those State Commissions except the last two.

Commr. Aitchison: Which were they?

The Witness: Virginia and Kentucky, the interest in those two States being divided in this case.

We have interested ourselves in this proceeding by reason of the statutory injunction in all of our States that requires the State Commissions to both file and prosecute complaints before the Federal Commissions in the matters of rates deemed to be discriminatory; that is, interstate rates deemed to be discriminatory to our people.

We also are here responsive to the shipping demand, the demands of shippers of our section who are dissatisfied with their freight rate adjustment as we have it.

Our people have never been quite satisfied with the class rate adjustment in Docket 13,494.

I went on the Georgia Commission just at the close of that case, just before the tentative order came out, and was on the Commission when it was finally adopted and put in intrastate in my own State.

Commr. Aitchison: Are you going to throw any light on the question I was asking yesterday, why when the Eastern Class Rate case was decided there was no action?

[fol. 5108] The Witness: I think so. I recall, with some chagrin, it was even in intrastate that our State carriers in publishing the rates intrastate labeled them—published with a big red flag—"published by order of the Georgia Public Service Commission."

I recall also my fellow worker, Hugh White, of the Alabama Commission came over to Atlanta as far back as 1927 and addressed a large dinner meeting, and his talk was on the inter-territorial freight rate barriers, and it would have been quite an argument in this very proceeding here today.

The question you raised as to why the South had not moved, following the suggestion made in 1926 by Mr. Eastman, would be probably manifold, but the main reason would be, we have been on the defensive all of the time.

Your Class Rate case was—the Eastern Class Rate case, if I remember right, was decided in the early part of 1930.

Then in 1931 we were confronted with the Ex Parte 103 proceeding.

I have asked several around the room here this morning: it is my recollection it was in 1931 that proceeding was commenced, and we had that to deal with then for several years during the depression, and then when our Class Rate case was finally brought in 1935 it was appealed for the very reason Ex Parte 115 had gone on the same question: Mr. Wilbur LaRoe had been employed to prosecute that case, and I understood—I was not a party to it at the time—

[fol. 5109] but I understood it was very largely on his advice, under the contention of the carriers, they shouldn't proceed with it.

Commr. Aitchison: The Eastern Class Rate case decision was January 15, 1931.

The Witness: That was 1931. I was thinking it was 1930. The Ex Parte 103 commenced in 1931 also, I believe in the fall of 1931.

That has been the main reason, because we have been resisting increases, and another main reason is that the Southern Commissions are not very heavily staffed. We haven't had the money or the facilities to organize the investigation, and then another reason would probably be, in my opinion, that the trucks afforded a measure of relief along through that period.

Now that the rates are stabilized and we have gotten them filed on exactly the level with the rail carriers, they ceased to be of much benefit in that respect.

But certainly there has been and is general dissatisfaction in the South with the present rate adjustment.

Mr. Widell's statement at Columbus that he was of the South and spoke for the South reminds me of the old Scotch lady that saw the troops marching along and her son Jim was among them, and she said, "Look, Jim is the only man in the company that is in step," and he does not speak for any organization except his Southeast-Southwest—I don't know who they are exactly, except some commodity shippers [fol. 5110] —but he left the impression he was speaking for the Southern States Industrial Council.

In spite of the fact that we have known that there is considerable railroad influence in that Council it has not gone on record as being opposed to this proceeding.

I received word in the early part of 1941, in March, 1941, that they would have a meeting in Atlanta of their board of directors; that they would consider this matter, and I knew that Mr. Widell was seeking to get a resolution condemning our action in pressing this proceeding.

I wrote to all the members of the board and asked them for an opportunity—I explained in that letter our position and asked for an opportunity to appear before them and make our position more clear to them, and they afforded that opportunity.

I was compelled to come to Washington and couldn't go before them, but Mr. J. O. Henry, our rate expert for the

Tennessee Commission, and Mr. Bachman, of Atlanta, did appear.

I received a letter following that meeting from Tyre Taylor enclosing a resolution in which he stated the Council had decided to remain neutral.

The entire resolution was adopted April 10th and said, "Transportation being vital to all industry and commerce is properly subject to Federal Government regulation; but that regulation should be sensible; should not invade the field of management and should apply alike to all forms of public carriers. The Council advises regulation of all forms [fol. 5111]. of transportation by the Interstate Commerce Commission. It also proposes to continue its interest in rate matters affecting its constituency, keeping in mind the interest of shippers, consumers, and transportation agencies alike. The Council recognizes, however, that each industry is the best judge of where its interests lie in this case, and that representing southern industry as a whole the Council cannot properly champion the cause of any member group to the prejudice of any other group. Accordingly where there is a substantial conflict of interests within the Council it will remain neutral."

Mr. Widell wasn't satisfied with his efforts there so he organized a forum under the guidance of Mr. J. U. Barr of New Orleans, that held a meeting over in Birmingham, Alabama, on the 10th day of December, 1941. This resolution was adopted April 10, 1941, and they invited several people to come and take part in that forum.

I accepted the invitation and went over and appeared on the program with Mr. J. E. Tilford of the L. & N. and Mr. Vogtle, both of those gentlemen of the L. & N., and at the conclusion of that meeting, which had been certainly called and planned for the purpose of adopting resolutions, adjourned without doing anything except reporting its proceedings, so I say there is no organized interest in the South that is opposed to it.

[fol. 5112] As Mr. Henderson has outlined, the State Commissions have worked with the shipper bureaus, members of the Southern Traffic League, and others.

Briefly, I would like to say in answer to Mr. Oliver's Chamber of Commerce speech before the Commission that he depicted a South that we couldn't recognize. I told him after his testimony that he reminded me of the old lady that had gone to the funeral and they had a new parson in town, and in the midst of the obituary she punched the boy and said, "Go up and look and see if we ain't at the wrong funeral," because I wouldn't recognize the South that Mr. Oliver painted to you.

The statement that railroads made adjustments as soon as they found out anything was needed, that they would make it just specifically—we had a livestock adjustment which you gentlemen have corrected. That was the result of an investigation that was forced on my State under a Thirteenth Section case, and it was a rate adjustment that had been put in between the railroads and the packers and wasn't designed to help the South. It was the highest rate scale in the whole nation, and when we organized under this same association I speak for here today to attack those rates the first thing we did was to contact the carriers and asked them to name the place that suited their convenience to talk to them about it, and they named Washington, so we all came to Washington and they listened to us and said nothing; said they would report to us, and we [fol. 5113] had a hard time getting an answer, and individually they would send somebody to our State Commissions to tell us we were wrong about it and that we shouldn't do anything about it, and nothing was done, and we were compelled to fight the thing all through.

We had a wine industry that started on a large scale in Georgia. One of them has hung on because he had a pretty good local business, but one was compelled to leave because we couldn't get any adjustment on those wine rates, and we do not have the policy he depicted here of getting any adjustment with carriers.

There was one other statement he made that I feel in justice I should answer, and I would like to say this too, that while I agree with everything that Mr. Henderson has said, I think the Governors would not agree with his stand that they did not commence until 1937, the 11th day of May, 1937.

As a matter of fact, the minutes of that organization show they had started back just about as early as the Southern Traffic League in 1934 trying to do something about bringing about an adjustment.

Chrmn. Alldredge: When was it they began?

The Witness: The first meeting was in 1934. The occasion was a dinner down in what we call in Georgia the "The

Little White House," and following that meeting in 1935 they met again in Montgomery, Alabama, but it is correct that in 1937 was when they took action definitely and [fol. 5114] organized and commenced to get the means of prosecuting the cases, and at that meeting there was a division of thought as to whether or not we should attack the commodity rates or the class rates, and growing out of that division the Governor of my own State—it seems I have a habit of developing this sort of thing—wanted to start forthwith and do the job, and he organized him a separate group to just correct it forthwith, and by main strength and awkwardness, but the other groups divided as to the class rate and the commodity rates.

Governor Graves of Alabama was the dominant figure in the whole conference, and much more active, so he pressed forward with the commodity case.

Mr. Oliver ridiculed the idea that they started out with a lot of complainants—and he pointed that out as a reason why the people in the South were not objecting—and then ended up with 14 or 15 commodities.

That complaint was filed, as I say, without consultation with any industry, and Governor Graves just sailed in and got him up a complaint and filed it and then went back to see who was going along with him, and those who were willing to provide finances and to furnish testimony stayed in the case and otherwise they were stricken.

Then, too, this is also correct, under the decisions and rulings herein before the Commission, if they were not shipping without the territory, namely, not discriminated [fol. 5115] against, they had no case in a Third Section case, so they couldn't proceed, and we had a good many that were in that predicament.

As I explained, the Class Rate case, which was later appealed because of the fact that the other case preceded, and the advice of counsel that it was not timely to present the Class Rate case when the carriers were compelled to be asking for additional revenues.

We are here, as I say, again responsive to the shippers of our section before this, the proper forum, and asking that the uniform system of rates be published for all the section that is involved in this entire proceeding.

Thank you, sir.

Commr. Aitchison: Are you convinced that the application of either the Official Classification or the Western

Classification in the South would meet the needs of consumers?

The Witness: Well, only by this, Mr. Chairman, that it has worked in the North and if fits commerce in the North it would fit it in the South.

Commr. Aitchison: The Official?

The Witness: Yes, the Official, and if it succeeded and worked in Official Territory there is no sound reason why it wouldn't in the South. I am convinced that it would.

Commr. Aitchison: What about the Western Classification?

The Witness: Well, I don't think that it has proven to be as successful as the Official Classification, so I still [fol. 5116] — we would fare better under Official Classification.

They have had many exceptions out there, as we have. We have gotten to where everything out there moves under exceptions.

I would like to say this, in further answer to the question as to why the South didn't do something about this, I would like to call attention to the fact that both North Carolina and Georgia undertook to correct the question intrastate but didn't get by with it by reason of the resistance of the carriers.

Commr. Aitchison: Is that all, Mr. Norman?

Mr. Norman: Beg pardon?

Commr. Aitchison: Is that all?

Mr. Norman: Oh, I have some witnesses.

Commr. Aitchison: I thought you were calling witnesses. Is that all you have?

The Witness: That is all.

Commr. Aitchison: Cross examine.

Cross-examination.

By Mr. Gwathmey:

Q. Mr. McDonald, I have one or two questions.

Does livestock move within the South or between the South and other territories on class rates?

A. I told about the livestock case, Mr. Gwathmey, to illustrate that the carriers did not, as Mr. Oliver had said, [fol. 5117] correct every complaint that was indicated to them. You evidently didn't follow my statement.

Q. I don't think you have answered my question either.

A. It does not in the South.

Q. Is your Commission advocating uniformity as between the North and the South, not on only class rate traffic but on other traffic.

A. Absolutely.

Q. Does that include not only manufactured articles, but raw articles?

A. It does.

Q. Does that include both state and interstate traffic?

A. It does. We have demonstrated in the Georgia Commission I think quite a spirit of going along with the interstate adjustments, a great many times when we haven't liked it.

Q. You recall, I suppose——

A. (Interposing:) I am just bragging on that.

Q. (Continuing:) —that there is a case pending before the Commission right now involving road aggregate rates.

A. That particular case has been to this Commission several times and to the Supreme Court of the United States.

Q. Under a 13th Section proceeding.

A. That is right. That is a rather local situation down there between the industrial interests of Alabama and Georgia that brings that about more than anything else.

[fol. 5118] Q. As a matter of fact, the railroads in Georgia have been, you might say, fussing with the Georgia Commission about that matter for about twenty years, haven't they, the 13th Section proceedings, off and on?

A. I think the southern railroads have.

Q. The Southern Railway?

A. The Georgia carriers have gone with us but it has been the Southern Railway that has pressed it.

Q. Just one more question, Mr. Chairman.

You have discussed at some length what positions have been taken or have not been taken at conferences held between the railroads and the various shipper organizations.

Does the Georgia Public Service Commission make it a practice to participate in conferences between the railroads and the shippers looking to the establishment of freight rates?

A. Do we make it a practice?

Q. Yes, sir.

A. We have conferred with the shippers and the carriers, yes.

Q. I spoke of joint conferences between shippers and railroads.

A. Yes.

Mr. Gwathmey: Thank you.

The Witness: We have, ever since I have been on the Commission; it has been quite a practice. We confer with rail representatives very, very frequently, more even than we do with the shippers, and we very often bring together [fol. 5119] the shippers and the carriers.

In the last few years we have been trying very hard to work out something on watermelon rates. We have had a good many meetings of the shippers and carriers in that case.

Cross-examination.

By Mr. Grubbs:

Q. I believe you were at the Indianapolis hearing.

A. Yes, I was.

Q. And you listened to the testimony of Governors Cooper and Holland at that time?

A. I did.

Q. You recall, I take it, what Governor Holland said on several occasions to the effect that the Southern governors did not want to hurt the railroads in this proceeding and wanted them to have rates that would yield to them a fair profit. Do you take any different view?

A. Absolutely not. We are just as interested in the railroads and their success as you are, and we feel very definitely in this proceeding that this being the main factor that has prevented the economic development of the South that you will reap the same benefit that the whole South will.

If we had the per capita income in the South of the Official Territory's per capita income, the South alone would produce a market one-half again as large as the foreign trade of 1938, and you would benefit right along with us.

[fol. 5120] Mr. Grubbs: Thank you.

Cross-examination.

By Mr. Clark:

Q. You live in Atlanta.

A. That is my official residence. My legal residence is in Augusta, your home town.

Q. That is right. You are familiar with Atlanta?

A. Very, very familiar.

Q. You agree with me that it is the outstanding city in the South?

A. It is.

Q. The Southern Railway has more lines in there than any other railroad?

A. Absolutely, and we are very proud of it.

Q. We haven't hurt Atlanta.

A. Not at all. We are very proud of the Southern Railway.

Mr. Clark: That is all.

Cross-examination.

By Mr. McCollester:

Q. Mr. McDonald, do the Southern State Commissions advocate that parity should be brought about by establishing the Southern basis of class rates within Official Territory?

A. We haven't proposed that in this proceeding.

Q. Would you favor it?

A. Well, we haven't proposed that, and I don't know that it is my province here to suggest how we should solve [fol. 5121] the problem. We have proposed that we have your level.

Q. In other words, you are proposing how you should solve the problem by proposing the Official level in the South.

A. That has been suggested, yes.

Q. Have you given any consideration to whether the Commission here should not, if it is to achieve parity, do so by increasing the Official level to the Southern classification.

A. We would think so. We have always contended that the costs in the South are no higher than they are in the North, and we feel that fact is well-established, and we can see no reason for that sort of reasoning. I said that the costs in the South——

Mr. McCollester: We know what you mean.

By Mr. McCollester:

Q. In other words, you don't think that the Official Territory class rates are too low?

A. No, we do not.

Q. Do you think that the Official Territory raw material rates are too high?

A. Well, we are not seeking to hold any advantage, if we have any, on the commodity rates.

We feel like the entire structure should be equalized. We are not asking for any advantage.

Q. Do you think there would be any opposition in the South to establishing rates on the pig iron from the Birmingham district to Atlanta on the basis that prevails on the movement of pig iron from the Buffalo furnaces to Albany, New York?

[fol. 5122] A. So far as the pig iron adjustment is concerned in the South, if you go into it, it isn't so very different.

We have got rates from Birmingham up to a new plant up at Toccoa—well, answering your question, we are not seeking any advantage. We are not seeking any advantage, and whatever adjustment is made in one section, we want it in our section.

Q. I am afraid you haven't answered my question, and I will ask the reporter to read it.

A. All right; that is the answer; we would not oppose it if that is the adjustment that is finally decided on as the uniform adjustment.

Mr. McCollester: I would like to have my question read to the witness.

(Pending question read.)

A. I don't know the rate. I started to make a statement about comparative rates, and it slipped my mind, and I don't know what that rate is, but if this Commission decides that is the basis that should be uniform, then we want it.

By Mr. McCollester:

Q. My question was, speaking for the Public Service Commission, whether you think there would be objection to the establishment of rates on pig iron from Birmingham to Atlanta on the New York State basis, which just about, if I am informed correctly, would double the rate.

A. I answer you again, we are not seeking any advantage: that if that is decided that it should be the rate in [fol. 5123] Official Territory, then we want that along with parity of everything else in the South.

Q. And you make your industries in Atlanta, that use pig iron, take it and like it.

A. I don't know if I could answer you any more definitely than I already have.

The pig iron adjustment, if that was found to be proper, our industries could live under it as well as yours.

Mr. McCollester: That is all.

Cross-examination.

By Mr. Clark:

Q. Do you think the Atlantic Steel Company would subscribe to that answer you gave to Mr. McCollester?

A. I wouldn't want to presume to say just what they would subscribe to, but knowing those gentlemen as I do, I think they would be willing to meet competition on an equal basis.

I think that you have raised a lot of questions here about pig iron, and Mr. Hart will be on the stand, and I don't want to get into a technical discussion of rates, but we are doing all right with our pig iron rates in the South.

Q. I am very much afraid, Mr. McDonald, that you want your cake and want to eat it to, is what I am coming to.

Go back to my question. Would you mind answering me? Do you think the answer you gave would suit the Atlantic Steel Company, which has a steel operation in Atlanta, Georgia?

A. I answered you before, I am not in a position to [fol. 5124] speak for the Atlantic Steel mill, and do not presume to do so, but industry generally in the South——

Commr. Aitchison (Interposing:) Wait a minute. He hasn't asked about that.

By Mr. Clark:

Q. I only asked about Atlanta. You are speaking here as Chairman of the Georgia Commission, of course, as we all know.

A. That is right.

Q. I don't understand you are speaking for industry generally, are you, any more than you are speaking for the Atlantic Steel Company?

A. I made the statement we were here responsive to the will of the shippers of the South.

Q. Mr. McDonald, the first shipper that I asked you about is a very large and important shipper of your present residence, Atlanta, and you very frankly told me you didn't speak for him. How could you make the general statement you speak for industry in the South?

A. You asked me, Mr. Clark, whether or not I spoke for this particular industry or a specific rate.

Q. Yes, sir.

A. I can say that a great many of our commodity shippers in the South go along with us in this effort with the feeling that it will improve section economically, and that even though they might suffer some loss in it, they are [fol. 5125] entirely willing to go along.

I don't know whether that is the position of the Atlantic Steel Company or not.

Q. I take it your testimony has applied generally.

A. Yes, sir.

Q. Surely you wouldn't undertake to speak for the shippers without the State of Georgia, would you?

A. I am appearing here for the Southeastern Association of Railroad and Utilities Commissioners composed of eight states.

Q. We have heard, of course, Mr. Hart and we have also heard Mr. Widell, and the contrary views of different ones.

Bearing that in mind, do you still say you speak for all the industry in the South? Let's see who you speak for.

A. I stated there is no organized group representing shippers that I know anything about that has gone on record against us, except the Southeast, Southwest shippers—something—that is an organization that has grown up out of resistance to this case.

Q. So there is some difference of opinion in the industry.

A. That much.

Q. Well, there is difference.

A. Yes.

Q. But you don't speak for all industry; isn't that true?

A. I tried to qualify it in my statement. I think I have made it clear.

[fol. 5126] Q. And you have proposed here to take the Official Territory level of class rates and commodity rates. Is that true?

A. Well, I haven't made any such proposal, Mr. Clark.

In answer to the questions here I have undertaken to say whatever the adjustment is, we want the whole adjustment.

Q. There has been much said about costs, so I am going to ask you to start with the premise, for the purpose of this question, that the cost of doing business in transportation would be the same for the two territories, north and south.

You recognize there is a very much larger volume of transportation in Official Territory than in the South, don't you?

A. Yes.

Q. With the difference in volume, the same costs, and the same rate level, don't you know it would have the inevitable effect on the lines of one territory making too much or lines of the other making too little.

A. I don't think it follows at all. You have got entirely different conditions up here—your investment, your cost of terminals——

Q. (Interposing:) That all goes into cost.

A. That is right.

Q. So when we start with the premise of equal cost, it takes care of and wipes out all of those; isn't that right?

A. No, I don't follow any such reasoning.

We have never felt that your premise that density was [fol. 5127] any justification for a different rate level.

Q. Let's analyze that a little further.

Suppose we were in the business of selling tablets to school children, and say I buy them at 4 cents and sell them at 5 cents.

Commr. Aitchison: I think you are getting a little argumentative.

Mr. Clark: This has to be a premise to bring out volume, if your Honor please.

By Mr. Clark:

Q. (Continuing:) Obviously, if you only sold a few tablets a month, or year, no business could live on that, but if you sold them by the tens of carloads you would make a very definite profit, would you not?

A. That follows.

Q. Isn't that a simple example of the effect of volume, applying that simple example to the dense traffic in Official Territory, as compared with the South, don't you know under the same level of rates, class and commodity, the Southern carriers could not live and give the service the South is really entitled to.

A. No, I don't know any such thing. You are a regulated business. You are entitled to a return on your investment, and on the whole, in the South, you have done better than have the carriers in the North.

Q. By virtue of recent years volume; isn't that true?

A. I don't know; I don't think so.

[fol. 5128] Q. Mr. McDonald, don't you know when we have thin traffic years we lines in the South are in very serious financial straits, and with the increased volume we can proceed to bloom, as we are doing at the moment. Doesn't that prove exactly what I am asking you, that volume controls this situation?

A. Of course volume does if you make a higher per cent, but I don't think that ought to control your rate structure, as you have in the past.

Q. My little simple example of the sale and resale of the tablets is illustrative of the situation, isn't it?

A. That is a logical statement, yes.

Mr. Clark: Thank you very much.

Mr. Norman: Well, Mr. McDonald, let's assume that the investment on which a return had to be earned was more, or the traffic was less dense, and taxes lower and various elements of that kind, might not that permit the road having the less density of traffic to make the biggest return on its investment?

The Witness: That was the substantial statement I made a while ago, that I think the conditions in the South are such that they have made more for those reasons, that they haven't the investment and do not have to have the volume in order to make a return on a regulated business.

Commr. Aitchison: It seems to me that Mr. McDonald is getting to the point where he is arguing this case. We are getting into the question of value, and we have some very [fol. 5129] sweeping statements. We have had some more precise testimony, and shouldn't that suffice?

The Witness: I think so.

Mr. Norman: I think that is correct, but I think inasmuch as Mr. Clark was permitted to bring out that side of it, that the other side might just as well be brought out also.

Commr. Aitchison: Let's attempt to get back into the regular line in some way.

Mr. Norman: That is all I have from Mr. McDonald.

Mr. Widell: I have one or two questions.

Commr. Aitchison: Mr. Widell.

Cross-examination.

By Mr. Widell:

Q. Mr. McDonald, on the question of your advocacy of rate parities, or rate equality in all sections of the country, I understand then that you advocate that right straight through from A to Z, classes, commodities, and everything. Is that correct, sir?

A. We are seeking parity in this case.

Q. You are familiar with the stove industry in the South?

Commr. Aitchison: Wait a minute, Mr. McDonald—parity with what? Make that more precise, Mr. McDonald.

The Witness: Well, Mr. Chairman, we recognize, of course, there might be some situations that would require local treatment, and Mr. Widell's statement undertook to commit me to the fact that there wouldn't be any [fol. 5130] exceptions in that rate structure, but as a general broad principle we are seeking parity in all the territories involved in this proceeding.

By Mr. Widell:

Q. In other words, then, on exceptions to the classification in Official Territory and commodity rates to suit the needs of consumers in Official Territory, you mean you desire to have the benefit of all that within the South too.

A. We think if they suit the needs of commerce in Official Territory that they will suit the needs of our people too, and they have proven the fact that they have in the North suited the commerce in the North.

Q. With regard to, say, the stove industry, which is represented in Georgia to quite some extent, are you familiar with the character of the inbound traffic and the outbound traffic of the stove foundries in Georgia?

A. No, I am not.

Q. But you do know, don't you, Mr. McDonald, that on the rates from the stove foundries in the South to destinations in Official Territory the Georgia stove people have the benefit of the northern level generally mile to mile.

A. That is correct. That was one of the things in the Southern Governors Commodity Case.

Q. So they do have that parity, so to speak, today.

Now, then, let me ask you this. You know, don't you, from your general knowledge of what the stove industry [fol. 5131] is in Georgia and in the South, that the inbound movement is generally coke and molding sand, scrap iron and pig iron.

A. That is right.

Q. There are four, say, major inbound raw materials.

A. That is right.

Q. Do you not know, Mr. McDonald, that if the Georgia stove people had to pay the Official level, mile for mile, on coke that their costs, their freight costs on coke would increase substantially.

A. It is my recollection that coke was one of the commodities that was treated ahead of the Southern Governors Rate Case.

Q. Just to refresh your memory, was that not from the South to C. F. A. Territory, Central Territory?

A. Yes, it was.

Q. Where the Commission prescribed the Central Territory rates on traffic from the South to Central Territory?

A. That is right.

Q. Do you recall in that case we demonstrated the general level of coke rates in the South is substantially less than C. F. A.?

A. Yes, that is right.

Q. So that if you did get parity for the stove industry in Georgia, you would have to increase their coke rates, wouldn't you?

A. Yes.

[fol. 5132] Q. Isn't that true also of molding sand?

A. I don't know. We had occasion recently to look at the sand rates, the sand and gravel rates, over the country, but molding sand doesn't move on those scales, does it?

Q. Don't you know molding sand in the South moves on the common sand rates?

A. How does it move in the North?

Q. Don't you know in the North molding sand rates are higher?

A. I didn't know it, but, Mr. Widell, we have put into this record a good many other industries that would have been just the reverse of what you are describing here with your stove industry.

Q. We were just confining it to the stove industry.

A. Yes, but we represent more than the stove industry.

Commr. Aitchison: Let's have one of you at a time. If you must follow that course, please only one of you at a time.

By Mr. Widell:

Q. In the stove industry then your inbound scrap rates would be increased.

Pig iron rate would be increased. Isn't that true?

A. I don't know the adjustments of those rates. I think they would be over some territories and some sections and not in others, but if it is, why we are asking for uniformity.

Q. Let me ask you this——

Mr. Norman (Interposing): Mr. Chairman, I would like to object to this line of cross examination because I think [fol. 5133] they are going into a great many questions that are not here, and when I put a witness on the stand that even wanted to talk about a column rate he wasn't allowed to do it because it was not in issue, and now they are bringing a witness in here and talking about rates on every commodity you can think of.

Commr. Aitchison: It is perfectly obvious we would be able to continue the cross examination along this line until we would be here until Christmas, and still be according to that which has preceded.

I think we will have to ask you to get down to the issues of this case and confine them to that, even in cross examination.

Mr. Widell: The witness' testimony went directly to the question of what he calls rate parities, including class rates, commodity rates, and all other rates,

Commr. Aitchison: He was dealing—I don't want to argue with you, but he was dealing with respect to the position taken down there by the industries. Obviously we can follow the details of these rates unto the utmost relevant facts and still not exhaust our library, but it is not helpful to us, and it is not going to be decisive in this case, and you might just as well save your time and ours.

Mr. Widell: Thank you, sir.

Commr. Aitchison: Mr. Hollopeter.

Cross-examination.

[fol. 5134] By Mr. Hollopeter:

Q. Mr. McDonald, I would just like to have you clarify for the record the meaning that you intended from your repeated statement that you believe it has been proven that the column rates have been proper and adequate to serve industry there. What did you have in mind on that?

A. Well, I simply base that judgment on the fact that you have used it and you haven't gotten away from it with exceptions and column ratings as we have in the South, and then too the fact that industry has prospered under that system of rates.

Q. Would you say the rates on textiles, in connection with the textile industry, were proven to be proper for the northern industries when they have permitted large removal of that industry to another territory? Is that your thought?

A. I think there was an entirely different factor that moved your textile mills than your rates.

Q. That would follow then with other industries which may have passed through the same transition period, would it?

A. It might have.

Q. In other words, the rates were not all-governing and all controlling.

A. No, we have never felt that was our whole trouble in the South. It is just one of the factors.

Mr. Hollopeter: Thank you.

Commr. Aitchison: Any further cross examination. (No response.)

[fol. 5135] You may be excused.

The Witness: Thank you, Mr. Chairman.

(Witness excused.)

Commr. Aitchison: Whom will you have next?

Mr. Norman: I will call Mr. E. L. Hart.

You have been sworn in this case, have you, Mr. Hart?

Mr. Hart: Yes, sir.

E. L. Hart was recalled as a witness and testified as follows:

Direct examination.

By Mr. Norman:

Q. Mr. Hart, you have previously testified in this case?

A. Yes.

Q. You have prepared an exhibit to be filed in connection with your testimony?

A. I have.

Mr. Norman: I would like to have the exhibit marked for identification.

Commr. Aitchison: It may be marked Exhibit No. 220.

(Exhibit 220, Witness Hart, marked for identification.)

By Mr. Norman:

Q. You have prepared certain testimony to be offered in rebuttal of testimony that has been heretofore presented in this proceeding?

A. I have.

Q. I will ask you just to proceed with your testimony.

[fol. 5136] A. Some of the witnesses in this case were accorded considerable latitude when describing their connection with, and knowledge of the class rate structure.

For fear that perhaps this might influence the Commission in the relative weight given their testimony, I should like to supplement the record with respect to my connection with, and knowledge of the present class rate structure—particularly in Southern territory.

My omissions in this respect were not accidental by any means; but, rather, I had hoped thereby to shorten the proceedings.

My railroad experience, or transportation experience, if you wish to put it that way, began in 1905, and terminated in 1921, at which time I became associated with the Atlanta Freight Bureau.

During the period of my employment with the transportation agencies my experience embraced practically everything in railroading, except telegraphing.

I began with the railroads in checking box cars in the yards. I ended my operating career as Chief Clerk in the Division Superintendent's Office.

I then became bitten with the bug of the traffic department, and I switched over to that department and had a number of years experience in rate matters.

So it might be said that I have had pretty varied experi- [fol. 5137] ence so far as railroad experience goes.

Now, I think possibly the record should show the character of the organization with which I am presently employed.

The Atlanta Freight Bureau is a non-profit organization and was organized by the business interests of Atlanta early in the year 1902, some forty-one years ago.

That organization has been very active in transportation matters since that date.

The organization represents 98 per cent approximately of local industry in the Atlanta area, and a very large per cent of what we term foreign industry, or branch plants, or distributing houses of northern concerns.

We also officially represent the City of Atlanta, and the County of Fulton, by virtue of substantial contributions by those Governments to the maintenance fund of the Atlanta Freight Bureau.

The County and City are both represented on our Board of Directors by a member of each governing Board of the City and County, designated by the Mayor and the Chairman of the County Commission from year to year.

Our Board consists of 26 members supplemented by an Executive Committee. The Board is representative of a cross section of business in the Atlanta area, and for that matter, in the State of Georgia.

I referred to the State because our organization does [fol. 5138] represent the entire natural stone industry, that is marble and granite, in the State of Georgia.

Likewise, it represents the stove industry in the State of Georgia.

So, on our Board of Directors are executives of those two industries. I am merely using them as an illustration.

For instance, the stone industry is represented by the Vice-President of the Georgia Marble Company. The stove industry is represented by the President of the Atlanta Stove Works and the Birmingham Stove & Range Company. They own one of the largest stove factories in the South, which is located at Birmingham.

I could go on and enumerate the different industries that are represented but perhaps one other important interest might be referred to and that is furniture.

We are large manufacturers of metal furniture. In fact at one time Atlanta was the second largest furniture manufacturing center in the South.

Q. For metal furniture?

A. For metal furniture. We make considerable wood furniture, and as to mattresses I think Atlanta is the largest single producing center of mattresses in the United States.

The Simmons Company has a very large mattress factory in Atlanta, as does the other mattress manufacturer located at that point.

[fol. 5139] So it can be readily said that I have necessarily and am required to keep informed not only about general matters but rates affecting practically every sort of industry in existence.

The Bureau today includes approximately 275 members. Included in this membership are manufacturers, jobbers, retailers, and such producers as the crushed stone producers and quarries of minerals, so I think that I have a rather broad knowledge of the rate structure that necessarily affects our people.

Our relationship with our members as to the rate adjustment is just as intimate as if we were a part of their organization. It isn't academic by any means. It is a realistic association.

Immediately after becoming associated with the Atlanta Freight Bureau I began work on what was then referred to as the 1921 Georgia Revision, at which time the Southern carriers had before the Georgia and Alabama Commissions the complete revision of their class rates and also certain commodity rates.

It has always been the practice, or certainly has for the past twenty-five or thirty years, of the southern railroads to use the Georgia rates, and to a lesser degree the Alabama rates, as a sort of guinea pig in testing out their interstate adjustments. How Georgia goes, is their slogan, goes the rest of the South with the possible exception of Alabama.

[fol. 5140] The 1921 Revision was more or less a hangover from what was known as the 1917 Revision which was undertaken just prior to the First World War. That was deferred until after the close of the War.

In the 1921 Revision the southern railroads proposed to the Georgia Public Service Commission a complete revision of the class rates based on the rates which they had in mind to establish interstate throughout southern territory. In other words the maximum distance in Georgia of 460 miles represented the Ohio River-Atlantic distance which was the key rate that the southern carriers used in working out their southern class rate investigation.

Therefore the scale submitted to the Georgia Public Service Commission on first class for the maximum distance in Georgia represented the proposed Ohio River-Atlanta first class rate. After all, that was really the beginning of the proceedings that later followed in Docket No. 13494.

I have participated since that date in practically every intrastate and interstate adjustment of any magnitude whatsoever involving rates within and from the South.

I think I can say without contradiction that I am the only man in the room, or maybe that will be in the room, that did not miss a single hearing in Docket No. 13494, including the Presiding Commissioner, Mr. Eastman, and the Examiners. Some of them were absent at times, but I never [fol. 5141] missed a hearing and I don't think any other man has a 100 per cent attendance so I have some conception of what took place during the pendency of Docket No. 13494.

Subsequent to the conclusion of that case I have participated in practically all of our inter-territorial controversies, if I may put it that way.

My exhibits Nos. 88 and 90 were prepared for the purpose of presenting a realistic, rather than an academic picture of the present class rate structure; and in my prepared statement (Exhibit No. 90) and supplemental oral testimony I purposely omitted submitting an extended historical summary concerning the development of the class rate structure, particularly in that section of the country lying east of the Mississippi River; and I so stated on page 1 of my Exhibit No. 90, giving the reason for this omission.

Nevertheless, carrier witnesses, and particularly Witness Bell, for the State of New York have testified in great detail about the history of the Southern rates, all of which is well-known to the Commission. It was discussed at length in the Commission's report in Southern Class Rate Investigation and other subsequent cases.

It is my belief and contention that history has little control over the matter of casting a new rate structure, such as is here under consideration, which after all——

Mr. Grubbs: Pardon me, Mr. Hart.

[fol. 5142] If your Honor please, I think this is an appropriate place for me to register an objection to the statement that has just begun and to serve notice that I feel compelled to register any like protests.

I took two hours last night and two more this morning reading this document through and I believe it violates nearly every rule that has been set up for the submission of evidence, and very largely it is argument. There are very few facts in it.

This statement that he is embarking upon now is certainly argumentative as are the several paragraphs that immediately follow.

Mr. McCollester: Mr. Chairman, may I join in Mr. Grubbs' objection?

I have, of course, full appreciation that in matters before the Commission considerable latitude is and must be allowed to witnesses in discussing the sort of matters that we have here. However, we have reached the rebuttal stage at this time.

So far as the State of New York is concerned if we have presented any facts that are incorrect, or have failed to present complete facts, it is entirely proper for a representative of the South to show our errors and to put in evidence in contradiction or in amplification, and we welcome that, but it is not appropriate to indulge in ar- [fol. 5143] gument at this time, and I submit, your Honor, that 85 per cent of the 36 pages of this document is argument or characterization of the testimony, or remarks that testimony was not offered, or discussion that has no place in testimony.

Let me direct your attention to just a few little things here and there.

Look on page 2, the first paragraph, "No one has thus far testified in the investigation, nor has there been offered probative evidence." That is not rebuttal of anything.

Look at page 6. He there is testifying what Mr. Bell has testified to.

Look at page 9. He says, again talking of Mr. Bell, he "offers little, if any, convincing evidence in this regard." Those are matters for the Commission to decide.

At page 11, "It seems doubtful that Mr. Bell's exhibit No. 164 has any value in the instant proceeding."

Page 16, "Competent evidence introduced by both shipper and railroad witnesses in this case clearly shows"—that is not rebuttal.

And then we end up, Mr. Chairman, beginning about page 32, I think with a peroration that either belongs only in brief, as being argumentative, or if offered as opinion testimony is competent testimony only from a person who—Well, I would say a Doctor of Philosophy or History or Economics. I don't think certainly that Mr. Hart qualifies [fol. 5144] to give opinion testimony if that is what it is, but I think it is really argument and ought to be left for brief.

I would object to the whole thing, Mr. Commissioner, because it is impossible to separate out what is rebuttal from what isn't.

Mr. Bell: I desire to join in the objection made, and in addition to point out that this is a continuous reference to testimony of six different witnesses throughout, containing quotations ad infinimum.

Commr. Aitchison: You were permitted to put them in.

Mr. Bell: I was not permitted to orally put them in.

Commr. Aitchison: They went into the record just the same and they are in the record now.

Mr. Bell: If this witness is permitted to orally state this I ask permission to recall Dr. Duncan and ask to have him put his testimony in orally, without any interruption.

The Witness: Let me make this one statement because I have some responsibility, of course, in this.

I tried at the opening of the hearing to shorten this matter by not going back and rehashing all this ancient history and I made my statements very short and concise and then the northern interests came along and went into all that history; they have opened it up and I merely was trying to more or less rebut that testimony to the extent that I felt it was pertinent to this case. That is all [fol. 5145] I have done. You can call it argument or what you please.

Commr. Aitchison: Well, it is a question whether the argument should be sworn to or not. That is what we have before us.

The Witness: I am just explaining why I did it.

Commr. Aitchison: Mr. Norman, you had something to say?

Mr. Norman: I just wanted to say this, Mr. Commissioner, that if you take this evidence and compare it with Mr. Bell's you will find that this isn't any more argumentative than Mr. Bell's, and when you go to answer a contention that has been made you of course must state what it is you are rebutting and that is what Mr. Hart has done, and in many instances it is opinion evidence that he is answering.

Mr. McCollester: You don't have to state what is not in the record in order to answer what is not in the record.

Mr. Bell: I was under the mistaken idea you had to state what you are rebutting, yourself. I agree with that statement, but the Rule prevented me from orally testifying.

Mr. Norman: If I understand your witness' evidence went in the record.

Commr. Aitchison: It is in the record. We had no objection to the testimony of Mr. Bell. I suppose you mean Mr. Charles E. Bell.

Mr. Norman: Yes, sir, and Mr. Oliver.

Commr. Aitchison: And we do have objection here. We [fol. 5146] want the facts that are here. This is not the time and place for argument. People who ought to hear the argument are not here and should not be compelled to wade through a big transcript in order to get the argument. The best way to straighten this out, it seems to me, is to go off the record and informally go through this statement and for the Bench to indicate the matters which it considers argumentative, and it is up to Mr. Hart to put the rest in.

The Witness: Off the record.

Commr. Aitchison: Off the record.

(Discussion off the record.)

Commr. Aitchison: We will adjourn until 1:30.

(Whereupon, at 11:40 o'clock a. m., a recess was taken until 1:30 of the same day.)

[fol. 5147] **Afternoon Session**

2:00 p. m.

Commr. Aitchison: Proceed.

E. L. Hart resumed the stand and testified further as follows:

Mr. Norman: Mr. Chairman, in view of the fact that this has all been gone over now in very large part, I think it might just be copied into the record as it has been changed.

Mr. Hart of course has some additional testimony that is not contained in that and he will indicate as he goes along where he is reading.

Commr. Aitchison: Very well.

The Witness: I don't recall, Mr. Chairman, just where I was stopped, but in any event I think up to and including the first paragraph of page 9, that we may pass that over without reading it.

Commr. Scott: Pardon me. Do I understand that we are to correct these as he goes along?

Commr. Aitchison: Off the record.

(Discussion off the record.)

The Witness: It is my belief and contention that history has little control over the matter of casting a new rate structure, such as is here under consideration, which after all, is a legislative function that looks to the future, rather than a judicial one that, necessarily, must give due [fol. 5148] consideration to what has been done in the past.

While history is, of course, always interesting, the people for whom I speak are not relying on history to support the contention that the present class rate structure is antiquated and fails to meet the needs of commerce under present conditions, unless it can be said that the historical background of the present rate structure supports such a contention.

In the testimony of Witness Ellison, beginning at page 3486 and continuing through page 3490 of the record, he leaves the impression that perhaps I incorrectly stated the situation with respect to the rates on important classes of traffic which are unrelated to the Index 100, or 1st Class, rate as compared with rates on traffic that are definitely related to such Index 100 first class rate.

Apparently, he missed the point that I was making, i.e., that the patterns of the rate structures in Official and Southern Territories had become almost identical, whereas this was not so prior to Southern Class Rate Investigation, Docket No. 13494, and that, because of this condition, I regarded the problem of unifying the class rate structures in Southern and Official Territories to be much more simple and decidedly less complicated than it would have been at the time the Southern Class Rate Investigation was instituted. The Commission referred to this at some length in its report in that case.

Mr. Ellison goes on to show that, as to the proportion of [fol. 5149] tons originated or carried, as related to the total tonnage of the railroads, the greater percentage moved under rates unrelated to the Index 100 first class rate, which, of course, is true in both Southern and Official Territories, when measured by tons transported. My point was, that as to the type or character of rates applied to the different classes of traffic transported by the railroads, comparatively few in number were transported on commodity rates unrelated to the governing 1st class Index 100 rate, and was directed entirely to items or ratings, and not to tonnage.

This statement of fact is confirmed by the testimony of Witness Crane for the Southern railroads, and is dealt with in detail by Witness Morris at pages 1 to 30, inclusive, of his Exhibit No. 15 introduced at the Indianapolis hearing. Therefore, there should be no confusion about my statement in this respect.

Likewise, this important class of traffic moves in Southern territory on a commodity rate scale unrelated to the Index 100 1st class rate.

Mr. Ellison then went on to compare the precise rate levels on different classes of traffic in the South with those in Official Territory, which showing, apparently, was premised on a misunderstanding of the purpose of similar comparisons which I made in Section III-D of my Exhibit No. 88. But, even so, some of his conclusions drawn there- [fol. 5150] from are not in accord with the facts. For instance, on page 3505 of the record the categorical statement is made that the Southern rate level on brick is lower than in the North.

While there is a general departure from the normal basis prescribed by the Commission in Docket No. 1885, 88 ICC 543, for the shorter hauls in the South, for the purpose of meeting truck competition, nevertheless, there are similar departures in Official Territory; and, in many instances, the long haul rates from actual producing points of brick and related articles are no lower in the South than in the North, while, in other instances, the Southern rates are lower. But only by a traffic test, which would disclose the weighted average level, could a proper comparison be made between the two rate levels.

However, as previously stated, my purpose was not to test the rate levels, but, rather, to test the rate pattern; and, as to brick and related articles, they are accorded commodity rates unrelated to the first class 100 rate in both Official and Southern Territories.

Mr. C. E. Bell, rate witness for the State of New York, testified at length. The purpose of his testimony apparently was to support the perpetuation of the old order of things in rate construction, disregarding altogether the revolutionary changes that have taken place in the more recent past—and certainly long since he left the employ of the railroads.

[fol. 5151] The contention of this witness for the need for territorial differences in rates (p. 3399) is repugnant to the evolution taking place in the rate structure in both Official and Southern Territories, beginning in the first decade of this century, whereby almost all of the territorial boundaries which existed at that time have been erased, leaving only the territorial boundaries dividing the principal geographical sections of the country.

In the first instance, these artificial boundaries were dictated by the controlling influence of a single railroad or group of railroads serving a particular section. The practice of dictating rate policies in these circumscribed areas preceded later control of rate policies by the railroads predominantly serving each of the geographical sections of the country. The only difference was in the degree of the control. Some of the more important former territorial boundaries are portrayed on Sheet I, of my Exhibit No. 88.

Mr. Bell, likewise, omits reference to the discard of the territorial rate boundaries as to express and passenger rates. It is my judgment this is a matter he should have also considered.

However, Mr. Bell's testimony directed to the development of the rate structure in the eastern section of the United States is not accurate. For instance, on page 3400 of the record he refers to the rate structure in Official Ter- [fol. 5152] ritory as related to industrialization in that section; but his description of the situation fits principally New England. This is confirmed by his reference to the movement of cotton from the South to New England on page 3406 of the record.

Certainly, the industrial development of Official Territory in the section west of Pittsburgh some years later; and the rate structure in that section of Official Territory was made adaptable to its industrial development in the CFA Class Scale Case, decided in June, 1917. (45 ICC 245).

Mr. Bell, at page 3413 of the record, in replying to a question from Commissioner Aitchison, made a very general statement concerning the character or the pattern of the rate structure in Official Territory, which implies a situation that does not exist as a practical matter, although Mr. Bell admits there has been a rapid change in the pattern of the rate structures in Official Territory since the decision in Eastern Class Rate Investigation, caused primarily by competition between the railroads and the other forms of transportation.

In other words, the general patterns of the rate structures and the rate levels in Official and Southern Territory are now much nearer together than they were at the time the Commission was considering the class rates in the East. Mr. Bell supports this conclusion at page 3416 of the record.

If it should be inferred from testimony such as that on [fol. 5153] page 3408 of the record concerning cottonseed oil that it was predominantly converted into finished products in the South; but this is not the case. This is one of the important Southern semi-raw materials that go to Official Territory for processing. In any event, the Commission is fully informed concerning the marketing of cottonseed oil, by virtue of its consideration of these rates in Docket No. 17,000, Part 8, 188 ICC 605.

A further illustration of Mr. Bell's effort to gloss over, so to speak, the factual situation at this time, are such statements as occur at page 3421 of the record, viz:

Mr. Bell, on page 3424 of the record, referred to supposed policy of the Southern railroads to make low commodity rates on inbound commodities on which they might secure the outbound hauls of the finished or processed products. This was especially true of rates on logs and billets for the manufacture of furniture, veneer, and so forth, also on iron ore, coal, limestone and pulpwood, and that:

These old low inbound rates are still reflected in the structures, for instance, on the log structure within the South.

It is true that there are published in the South so-called net transit rates on logs for the manufacture of veneer and other products, but, as to logs, the situation in the [fol. 5154] South is not far different from that in other sections of the country. In addition, the old log transit scales which Mr. Bell refers to have subsequently become more or less modernized by virtue of truck competition and numerous complaints before the Interstate Commerce Commission. Some of the more important of these cases are shown on page 2 of his Exhibit No. 164.

Mr. Bell testified at some length concerning the rate levels on so-termed raw materials in the South, and among those referred to on page 2 of his Exhibit No. 164 was logs.

Mr. Bell's comparisons were between the rates that the Commission has prescribed on logs in Central Freight Association Territory, commonly referred to as the Indiana Case, in which rates were made 65 per cent of the then existing Sixth Class Rates.

By comparison he uses the co-called Pierpont Scale, which was described by the Commission in 50 ICC 81. That scale, it is true, as stated by Mr. Bell, has pretty general application in Southern Territory for the longer distances.

However, *that* since that scale became operative generally in the South numerous departures have been made from the scale particularly for distances within the range of 125 miles.

It also should be stated that within a number of the Southern States, in Georgia, for instance, the old so-called lettered Class P rates are still applicable on the logs when shipped into mill points for transit and further manufac-

[fol. 5155] turing, so Mr. Bell's exhibit is not indicative of the level of the rates on logs in my opinion in either Southern or Official Classification Territory.

To indicate that there are rates in certain sections of Official Territory which he did not refer to, I have prepared a comparison which is shown on Sheet 1, of my Exhibit No. 220 to indicate that in certain sections of Official Territory there are rates on logs on a mileage basis that are comparable with the Southern Scale.

In other words, Mr. Commissioner, it is my position that a mere paper comparison such as Mr. Bell makes, and then takes the position that that represents the identical level of rates on logs, for instance, in the two territories, is not true.

The only way in which that exact difference might be determined would be to take a weighted average of the rates in all of Official Territory as compared with all the Southern Territory. That is the only manner in which an exact comparison could be made of the existing rate levels.

Mr. McCollester: You don't attempt to supply that, do you?

The Witness: I merely picked out certain illustrations to show they are as low in the North as they are in the South, in certain sections, but not in Indiana.

On page 3423, Mr. Bell refers to what he terms my criticism of the Commission's action in Southern Class Rate In-[fol. 5156] vestigation with respect to the percentage relationship—lower classes to 1st Class—proposed by the Southern Traffic League in that proceeding, and adopted by the Commission.

It is true that Mr. Harry T. Moore, my predecessor, was one of the principal proponents of the relationship—lower classes to 1st Class—proposed by the Southern interests in this case, and presented by him as a witness for the Southern Traffic League.

The relationship was worked out by a committee of the Southern Traffic League, composed of Mr. J. T. Ryan of the Southern Furniture Manufacturers Association, High Point, N. C.; Mr. Hugo Ignatius, now General Traffic Manager of the International Paper Company; Mr. Moore and Mr. Joseph C. Colquitt, formerly with the Commission, who was employed to assist the Committee.

As the one charged with the duty of preparing rate exhibits, and so forth, submitted on behalf of the Southern

Traffic League and others in this case, naturally I took part in the many deliberations of this committee. The adoption of a standard relationship of lower classes to 1st Class in conjunction with either the first class rates proposed by the Southern shippers or Southern railroads in this case represented a vast improvement over conditions then existing.

Mr. Bell commented at some length on the percentage relationships lower class to 1st Class which this Commis- [fol. 5157] sion prescribed in the Southern Class Rate Investigation and adjusted the manner in which those class rate percentages were arrived at before they were proposed by the Southern Shipping interests in that case and later adopted by the Commission.

I did want to supplement that statement by saying that in arriving at those relationships we gave very careful consideration to the many class rate scales that were then in effect in Southern Territory.

For instance, we had one scale on the A G S; three of the A B & A which is now the A B & C; eight of the A C L; six of the Central of Georgia; two of the G S & F; one of the G M & O; two of Illinois Central; three of L & N; one of M & O; one of M C & St L; one of St. Louis & San Francisco; ten of the Seaboard; seven of the Southern Railway; and one of the Y & M V which was then not a part of the Illinois Central..

Those class rates were tested from 5 miles on out to the full length of those scales together with our relationships, and I am merely stating that to show how much consideration we did give to those relationships lower class to 1st Class.

We also had before us in the consideration of that particular matter the scales that you mentioned yesterday, Mr. Chairman, that the Director General put out where one scale was predicated on applying the percentage relationships under the Western Classification as compared with the Southern classification, so I want it clearly understood [fol. 5158] that those relationships were not just picked out of the air, and of course we had to bear in mind the relationships that were then existing in Official Territory which were not uniform by any means, being different in the different sections of the country, and also overhead rates between Trunkline Territory and Central Territory were on the McGraham Formula and had a different relationship, but all of that was considered at the time we proposed those relationships in the Southern Class Rate Investigation.

Suffice it to say that these relationships—lower classes to 1st Class—were also agreed to by the Official Territory shippers who took part in this proceeding—particularly the New York and Chicago shipping interests.

I might as well state here that the Official and Southern Territory shippers were pretty well together in the Southern Class Rate Investigation; and, while it might appear paradoxical in the light of what has transpired since that case was concluded, nevertheless, the facts are that the rate exhibits introduced in this case by the New York shipping interests, for whom Mr. Bell is here testifying, and the rate exhibits introduced by the Chicago shippers, were prepared under my supervision in Atlanta, Georgia, by virtue of a cooperative arrangement worked out between these interests and the Southern Traffic League, although the exhibits were introduced by appropriate witnesses representing the Official Territory shippers.

[fol. 5159] Mr. Bell, on page 3424, also seems to take exception to my criticism of the percentage or column formula of constructing rates on various classes of traffic—particularly carload traffic—which has become so popular in the more recent years, I think that Mr. Bell probably misunderstood my criticism of the use of this formula of rate construction, because it was premised primarily on the result of its use in conjuction with the governing 1st Class 100 rates prescribed by the Commission in the Southern and Eastern Class Rate Investigation.

Although I cannot speak for the Official Territory interests that participated in the Southern Class Rate investigation, nevertheless, I can say with assurance that had the Southern shippers been able to foresee such a situation as has developed in this respect, a very different case would have been made by them—particularly with respect to the interterritorial rates.

I agree with Mr. Bell that if the Index 100 rate is proper, perhaps the percentage or column formula of rate making tends to simplicity in rate publication and is not particularly objectionable on traffic that moves generally.

Beginning on page 3424 and continuing through page 3420 of the record, Mr. Bell discussed at some length my criticism of the class rate structure approved by the Commission in the Southern Class Rate Case between trunk line and New England Territories and the South which stemmed [fol. 5160] from a plan of rate making adopted more than fifty years ago by the Coastwise steamer lines in conjunction with their Southern rail connections whereby through one-factor class rates on a non-concurrence plan were operated by the Coastwise lines, and which had the effect of controlling for these lines and their Southern rail connections a large proportion of the south-bound traffic moving from Eastern Seaboard Territory to the South, which condition was perhaps given too much consideration by the Commission in the Southern Class Rate Case.

While approving the general plan previously adopted by the water and rail routes, the Commission, in the Southern Class Rate Case, condemned the non-concurrence plan of publication of Rail-Water-and-Rail rates between these territories. The reasons given by the Commission for the approval of the Southern carriers proposal to continue the general plan of constructing rates between the East and the South are explained in detail in its report in the Southern Class Rate Investigation.

However, this condition certainly has not existed recently. Certainly no water line continues to control the rates from the interior East. Under the present law they would not be permitted to reestablish the old plan of non-concurrent rates in order to attract the traffic.

Even at the time of the Commission's decision in the Southern Class Rate Case there was no practical reason [fol. 5161] why the all-rail rates from Trunk Line and New England Territories to the South should not have been made on the Q-1—K-2 basis observed in constructing rates from other sections of Official Territory, and to the extent that the rail-and-water routes were desirous of participating in this traffic, appropriate differentials necessarily would follow.

I desire to reiterate my previous position that the approval of this adjustment by the Commission in Southern Class Rate Investigation was a fundamental error, and the incongruities that flow out of same are indefensible. Some of these were pointed out in my Exhibit No. 88.

As all of the Coastwise lines are now subject to the jurisdiction of this Commission under Part III of the Transportation Act, there appears to be little reason for this situation to be continued.

Mr. Bell raised the point to the effect that should the all-rail rates between the South and Trunk Line Territory be constructed on the present Official Territory level, differential rates via the water routes would, therefore, become lower; but, such a situation is no different than that which obtains in the rates between Trunk Line Territory and CFA Territory, i.e., the rates via the all-rail routes versus the differential routes.

In other words, if there were a uniform system of class rates in the territory east of the Mississippi River and a [fol. 5162] shipper of 1st Class articles located at Chicago and Atlanta shipping into New York City, the all-rail 1st Class rate would be approximately the same; and it is conceivable that the Coastwise lines operating from the South Atlantic ports might desire to establish a differential 1st Class rate from Atlanta to New York, which would in effect coincide with similar differential rates maintained from Chicago to New York. But New York would also benefit in the sale of its manufactured products in the South.

I did want to discuss a little bit further the matter of the inter-territorial rates that were prescribed in the Southern Class Rate Investigation between Trunk Line and New England Territories and the South via both the all-rail routes and the water-and-rail routes.

I think perhaps this Commission's attention in this connection might be directed to a memorandum filed by the Southern carriers on October 6, 1925, in ICC Docket No. 13494, Southern Class Rate Investigation, which deals at some length with this situation that I have referred to between Trunk Line and New England Territories and Southern Territory.

Mr. Bell's Exhibit No. 164 shows a number of selected classes of traffic and the present rate levels in the South, compared with those applied on the same classes of traffic in Official Territory.

As I have previously stated, the comparisons which I [fol. 5163] made on various classes of traffic moving on commodity rates unrelated to the 1st Class 100 rate was for the purpose of offering proof in support of the contention that the rate pattern in the two territories is practically identical today.

In other words, my purpose was to show that as to these particular classes of traffic, all of which move in large volume, they were accorded rates in both territories unrelated to the first class 100 rates. They were not for the purpose of making a comparison of the paper rate levels which they would represent in many instances, because as is the case with Mr. Bell's comparison the actual rate level could only be determined by a weighted traffic test.

A much more elaborate showing of this character was filed by me in the Southern Textile Case, I. & S. Docket 3636 as my Exhibit No. 532 consisting of some 100 pages, wherein I compared the rate levels in the two territories on every class of traffic of consequence. But because of the reasons which I have just stated the Commission discounted such a showing as having little probative value without proof as to the actual level of rates applying on the various classes of traffic set out in my exhibit. Likewise, in my opinion Mr. Bell's Exhibit No. 164 does not disclose the full fact except perhaps to support his repeated statements that the rates on low grade commodities have been made on a lower basis in the South than in the North. [fol. 5164] I do not agree that because the Southern carriers have made lower rates on so-termed low grade commodities and on raw materials than have the Official Territory carriers in the Great Lakes and Central-Eastern regions it follows that the Southern carriers must maintain higher rates on the higher grade traffic, as this premise fails to give consideration to the heavy increase in relatively high grade traffic, in Southern Territory such as papers, a higher relative level of rates on which certainly would not be justified in the South solely because of this historical consideration.

Neither does the fact that the Southern fertilizer rates were reduced because of truck competition argue that the rates on papers, for instance, should be made higher in order to make up the revenue the Southern carriers lost on the fertilizer tonnage which they handled on the reduced rates as compared with the rates found reasonable by this Commission, and which were higher than the rates prescribed for application in Official Territory. I do not understand why fertilizer was included in Mr. Bell's comparison except for this reason, because it is not a raw material, nor is it really a low grade commodity. A significant factor that Mr. Bell does not state is a comparison of the two rate levels on bituminous coal which is by far the largest single low grade tonnage moving in Southern Territory, and naturally has a very direct bearing on industrial expansion. [fol. 5165] To the extent that there is increased origination in the South of processed commodities, it must follow that the ratio of low grade tonnage to the total tonnage originated by the Southern railroads will change materially and supports our contention in this case.

On page 3599 of the record, responding to question by his counsel, Mr. Bell stated that it was his opinion that the great difference which he had been pointing out in the volume of iron and steel movement in Official Territory and in the South and in the possibility of such movement because of the presence of raw materials in Official Territory constituted an important distinguishing factor affecting both the pattern of the rate structure in Official Territory as distinguished from that in the South and the tonnage available to the Official carriers to defray the transportation burden in Official Territory. This conclusion was expressed in connection with the subject that he was discussing, i. e., the distribution of the traffic burden.

However, I fail to follow the connection it has with the pattern of the Official Territory rate structure, as I construe and have used this term, unless he has in mind that the proportion of a given kind of material used in the Official Territory rate pattern which I claim to be almost identical with that of the Southern rate structure was different from that used in the Southern pattern. The relative importance [fol. 5166] of the distribution of the traffic burden in Official Territory versus the South seems questionable so far as this case is concerned.

On pages 3606 and 3607 of the record, one of the group of commodities referred to which constitutes an important proportion of the traffic in the Central-Eastern and Great Lakes regions, and which he claims in the nature of things cannot be originated in similar volume in the South, in glass, other than plate, glass bottles, jars, et cetera.

It is an incorrect assumption that glass of this character cannot and is not economically produced in the South, or that at some future time the volume might not reasonably be expected to be comparable with that produced in the Central-Eastern region. Flat glass, for instance, is now produced in large volume in the eastern section of Tennessee and not so far distant from competing producing points located in the lower portion of the Central-Eastern region, although the rates from Tennessee producing points are higher relatively than from the competing producing points north of the imaginary line that separates the two regions.

These higher rates from the producing points in the Southern region were prescribed by this Commission because of assumed difference in transportation conditions whatever that term covers and are referred to on Sheet 5, Section III-A of my Exhibit No. 88. Glass bottles are also [fol. 5167] manufactured in the South in considerable volume. White glass bottles are produced in volume at Laurens, South Carolina, Jackson, Mississippi, and Jacksonville, Florida. Blue glass bottles are produced in volume in Chattanooga, Tennessee, and at Laurens, South Carolina.

The prevailing rate level on glass bottles, carload, in the South and inter-territorially is the Classification basis of 7th Class or 35 per cent of 1st Class, and is approximately 175 per cent of the prevailing rate level in Official Territory. (See Sheet 2, Section III-B of my Exhibit No. 88) (Mr. Oliver on page 3858 of the record refers to both the Official and Southern levels as being established to meet truck competition).

While efforts have been made to secure northbound rates into Official Territory on the prevailing level applying within that territory from at least one of the Southern producing points of glass bottles, these efforts have not been successful. There have been other productions of glass bottles under consideration in the South which were not ultimately developed for various reasons.

The difference in rate levels on glass bottles has a very decided influence on other Southern industry, particularly manufacturers of liquids, such as drugs and medicine, wine and so forth, because of the pricing system of the manufacturers of glass bottles, wherein the Southern user is [fol. 5168] compelled to pay a relatively much higher price for bottles even when purchased from the Southern manufacturer than does a similar user located in Official Territory.

For instance, the price on certain types of white bottles delivered in Atlanta on a per gross basis is the same whether it originates at Jackson, Mississippi, Jacksonville, Florida, or Alton, Illinois, but the price is controlled by a base price at one of the Official Territory producing points plus freight to the Southern consuming point.

The transportation cost to the Southern users of glass bottles being 75 per cent higher than to a similar manufacturer located in Official Territory. In other words, the delivered price of glass bottles in Official Territory, which is fixed by the Official Territory producers, even when shipped from a Southern manufacturing point, is much less than to a Southern consuming point of equal distance. This condition in certain instances has controlled the location of the manufacturers of patent medicines. However, there appears little justification for the Southern rate level to be 75 per cent higher than the Official Territory level, mile for mile.

On page 46 of Exhibit No. 165, Section I, Mr. Bell refers to twelve commodities which he states are in the nature of low grade heavy loading commodities on which the carriers in Southern region have seen fit to maintain rates on a level generally the same as or lower than the level of [fol. 5169] rates in Official Territory. This list included sewer pipe and drain tile. Certainly these commodities are not low grade, heavy loading commodities. Nor are the rate levels in the South as low as or lower than those in Official Territory on artificial stone, plaster or cement or fertilizer, except with respect to the short haul truck competitive rates on fertilizer previously referred to.

Mr. Bell, in discussing his Exhibit No. 165, referred to certain heavy loading low grade commodities which he listed on Sheet 46 of that exhibit.

It includes the artificial stone. I don't know why he would select artificial stone any more than he would some other class of stone, but Mr. Bell apparently overlooked the fact that the rates on artificial stone of all finishes were prescribed by this Commission at the same time that the rates on natural stone were prescribed in the Consolidated Stone Cases. Therefore I don't understand just what rates Mr. Bell has reference to when he refers to those on artificial stone.

The actual rates on artificial stone, which are the same as natural stone, are shown on Sheet 8, Section 3-B of my Exhibit No. 88.

I also am unable to connect Mr. Bell's statement with respect to the level of rates on cement and plaster because the rates in the South are, generally speaking, higher than [fol. 5170] they are in the North, except as to New England Territory, so it would not be a correct statement that the rates on cement in the South are lower than they are in the North.

This is equally true as to plaster. Plaster in the North goes on a mileage scale, which this Commission has approved, while in the South it moves on a percentage of the 1st Class rate and is much higher relatively than the mileage scale that is applied in the North.

That is equally true as to plaster-board.

On page 3615 of the record Mr. Bell discusses the list of commodities in appendix LL, Exhibit 14 introduced by Dr. Aitchison. There seems to be considerable difference of opinion as to whether the term "commodity rates" properly include so-called column rates which are definitely related to the 1st Class rate, either by exceptions to the Classification or in the Classification proper. These ratings may, in some instances, be stated as Column 27½, for instance, or Class 27½.

Mr. Bell states that practically the entire movement of fresh fruits and vegetables in the products of agricultural group is on commodity rates, whereas a large part of the movement is on column rates or rates made a definite percentage of 1st Class and were prescribed by this Commission.

Likewise, he refers to rosin as moving on commodity rates, whereas it moves predominantly on a percentage [fol. 5171] of 1st Class which was likewise prescribed by this Commission. While I agree that perhaps many commodities which move on this type of rate are not directly covered by this investigation, so far as I know, until this investigation was under way, most every one considered this type of rate as a part of the class rate structure and not what was commonly referred to as commodity rates.

Certainly it cannot be said that the Index 100, or 1st Class rates, do not in many instances control rates made a definite percentage of such rate regardless of what they are termed.

In discussing the practice of both the railroads and this Commission in fixing rates on numerous classes of the traffic directly related to the governing 1st Class Index 100 rate, where the question has arisen concerning the difference in the two rate levels as expressed by the 1st Class rate which I wish to refer to as being 38 per cent, there seemed to be some question certainly that — the

Commission nor the railroads gave that very much consideration in fixing the rates on different classes, but this is not so.

I think maybe reference to one case between the South and the North will suffice, and it indicates the action of the Commission in that particular case, which involved the rates on canned goods between Southern and Official Territory entitled "Investigation and Suspension Docket 3401," reported in 179 ICC 77, and I would call particular [fol. 5172] attention to Commissioner Lee's dissenting opinion in that case appearing on page 100. I think he fairly stated the situation in that respect.

Then a more modern case, so to speak, where we are confronted with that possibility had to do with the rates on wood charcoal from the South to destination in Western Trunk Line Territory, Docket 2608, 253 ICC 543.

There the Commission just recently prescribed rates on charcoal from the South to the Northwest, the same percentage of first class that obtains within the Northwest.

If that principle was followed out in the rates on charcoal from the South to Official Territory which has also been prescribed by this Commission, it would represent quite a material increase in the present rates, but the point I am making is we have to be confronted with these prescriptions by the Commission and voluntary action by the railroads of relating different classes of important traffic to these going 1st Class rates, and which makes the level the same as between the 1st Class rates.

Commr. Aitchison: We could have largely avoided that, couldn't we, if the guide had been used of taking we will say 3rd or 4th Class as the governing class following that 1st Class, relating rates below it by numbers and rating the higher classes by multiples of 1st Class?

The Witness: There are a good many ways to do it. That is one, but there are a good many ways to do it. They [fol. 5173] could also make the levels the same by making a lower percentage of the Index 100 rate from the North to the South and within the South. There are many ways of doing it.

Commr. Aitchison: Another way would be, taking the British way, the lowest class and calling that Class 1, and then coming upward to the limit, to the sky.

The Witness: I have seen a lot of formulas but of course they all have a particular objective depending upon the author of the formula, so that is our trouble. We have a formula that will give us what we want and the other fellow has one that gives him what he wants.

Commr. Aitchison: If we are going to study this question of the freight problem in the two territories it is your thought we can simply look at the 1st Class and say "There is the difference?"

The Witness: Well, as a practical matter I would say not, Mr. Commissioner, but that is the trend of affairs, and we found ourselves in the same predicament as the fellow with the horse and buggy and the automobile comes in and he finally concludes that he is going to do away with the horse and buggy and get him an automobile.

We didn't like this column fixing that this Commission began early after the Southern Class Rate Case became effective and the Consolidated Southwestern Case, which was six months later, but we were forced into accepting it [fol. 5174] as a means of revising these many commodity classes of traffic that followed, and we sort of got on the band wagon with the rest of them although we felt ourselves that probably that wasn't the proper way to approach it.

Commr. Aitchison: If we were going to get an Index, or more than one Index of the relative level in the South and in the adjacent territories, what is your thought as to how many indices we should have? Do you have an opinion you would care to express?

The Witness: I don't know whether your question is broad enough to carry with it all classes of traffic.

Commr. Aitchison: Yes.

The Witness: Or whether we are dealing with class rates as we know it.

Commr. Aitchison: With all traffic as well as class rate traffic.

The Witness: Of course my own personal views are that there should be two scales, a carload scale and an l.c.l. scale. As to the less-carload scale it need not be composed of very many classes.

Commr. Aitchison: I am wondering whether or not you would break it up further than that and look at the products of agriculture as a whole, the products of mines, the products of forests in like manner, merchandise, less-than-carload.

The Witness: The only refinement I would make, Mr. [fol. 5175] Chairman, might be to break up your carload traffic into light loading versus heavy loading, which I might also do with respect to your less-carload traffic.

For instance, there might be a long difference between say reed furniture l.c.l. and iron and steel l.c.l., but I think still that even with that wide difference in weights per cubic foot that we would need very few classes as such.

I think maybe your carload traffic might be a little more refined than just having the two groups as I suggested.

Commr. Aitchison: I am not speaking about the classification.

The Witness: I am talking about rates.

Commr. Aitchison: I am trying to find out what the levels of the rates are comparatively.

Mr. Norman: Present levels?

Commr. Aitchison: Yes, indices, and I am wondering whether we should take and work, we will say, in the production of agriculture and try to find out what the levels are on that; the products of mines the same way, the forests likewise, and the manufactures we will say as a whole, and less than carload as a whole, or perhaps split up. Do you think one could be devised which would show the relative rate levels in the South and in adjacent territories and mean anything?

The Witness: I think so. I think you could take either index, Index 100 in either territory. It would require a [fol. 5176] traffic test in order to find that level. You could get a weighted level. Whether that would represent actually the rate level, I don't know, but I believe it would be as near as you could get it. Certainly you couldn't take a paper level.

Commr. Aitchison: You wouldn't be able, after you had done all that and gotten your actual charges and weights and so on and so forth and the rates applied to the rates in the one territory and attempt to contrast it with the other; you would immediately run up against the question, is the traffic similar.

That is the reason I am suggesting for your consideration whether we need more than the one index.

The Witness: I don't think you need but the one index. That is my own conclusion about it. One index is sufficient.

Commr. Aitchison: How would you go about it to get that index?

The Witness: I don't know that I am prepared to expound that at the moment.

Commr. Aitchison: All right.

The Witness: I have some ideas about it. I don't know whether they are sound or not.

Chmn. Alldredge: On the other phase of that discussion which you just briefly mentioned as to a revised rate structure, if the classification of articles were converted to a percentage basis, rather than a numbered or lettered class, [fol. 5177] say a certain percent of the basic rate, would there be any necessity in publishing in the rate tariffs more than just one basic class rate?

The Witness: No, there would not be. You would have to provide in the tariff a percentage table somewhere in the tariff to be applied against the Index 100 rate. That would be all that would be necessary.

Chmn. Alldredge: If you had a basic 100 per cent scale, we will say, and the classification showed that a certain article was 70 per cent, indicating 70 per cent of that, and you had a uniform simple fraction rule wouldn't that simplify the situation with regard to tariff publication?

The Witness: Yes, it would simplify it very much.

Chmn. Alldredge: Thank you.

Commr. Splawn: This testimony about these rate levels, and so on, you are not suggesting we have all these rates before us in this proceeding, are you?

The Witness: No, Mr. Commissioner. I think it is unfortunate indeed that these rates have been brought in here. We didn't bring them in but somebody thought we did, apparently.

Commr. Splawn: Were they brought in in an effort to approximate rate levels in different rate territories and show whether or not there is a difference and how much perhaps? Was that the purpose?

[fol. 5178] The Witness: I think surely that was the purpose of the witnesses that have brought in these commodity studies, except my exhibits in the first instance, which were merely in these showings as to commodity traffic, is to show the Commission which class of traffic moved on strictly commodity rates unrelated to 1st Class and which moved on rates that were related to the class rates.

By doing that some of the opposition to Southern papers contention presumed I was trying to compare, I suppose, the rate levels as such, which I was not trying to do. I was merely comparing the patterns of the rate structure of the whole, and Mr. Bell comes along and in his Exhibit No. 164 attempts to compare the actual rate levels which are not actual rate levels; they are paper rate levels because there is no way in the Lord's world you can arrive at those exact levels without a traffic test. It is not possible to do it, but so far as their showing goes they are all right so far as the paper showing is concerned.

Chmn. Alldredge: Traffic tests something like you indicated on logs?

The Witness: Yes, unless everything moved on that scale; then that would be a proper test, but I don't know of any instance in which that occurs.

Commr. Splawn: This testimony you are giving, this exhibit, if I understand, is merely criticizing the study of rate levels that has been made.

[fol. 5179] The Witness: Yes, I have criticized it pretty well throughout.

Commr. Splawn: Is that the purpose of the testimony?

The Witness: Yes, I question its value at all as to this case.

Commr. Splawn: The purpose is not to enable us to find the rates on all these commodities?

The Witness: No, sir; I don't think you can from these exhibits. I don't think it is possible to determine what the rate level is on any of these commodities.

Commr. Splawn: You heard the testimony of Commissioner McDonald this morning?

The Witness: Yes, sir.

Commr. Splawn: As I understand him the desire of the Public Service Commissions in several of the Southern States is for parity of all rates on all commodities, and within, from, and to the South, to all these rate territories. Is that a correct statement?

The Witness: I think that was probably—I will put it this way; maybe the choice of words was unfortunate perhaps but I think it is true generally.

Of course Mr. McCollester brought up the question of pig iron moving from Birmingham to Atlanta vs. Buffalo to Albany.

Of course Mr. McDonald didn't know, as he probably was [fol. 5180] not expected to know that you can't test the Birmingham-Atlanta rate by the paper rail rate from Buffalo to Albany because the movement of pig iron, if there is any movement from Buffalo to Albany is by the New York Canal. There is a great movement of pig iron over the Great Lakes route. They haven't compared the Birmingham-Atlanta rates with those rates at all.

Mr. McCollester: I will let you take Buffalo-Elmira, New York.

The Witness: I say that isn't a proper comparison. You can find rates in the North that are comparable with the Birmingham-Atlanta rate and you can find rates that are higher.

If I were going to test the relative rates on pig iron I would find out where the movement was and how the movement was On the rates on pig iron from the South the rail rates don't indicate the level because a great amount of that iron under certain conditions and at certain times moves by barge. It doesn't move by rail, so these rail paper rates don't mean anything unless you are going to test the level.

If we were going to test the level we would make a proper showing here but I don't think those are involved.

Commr. Splawn: Did I correctly state Commissioner McDonald's objective as to the ambition or purpose or desire, or whatever you call it?

The Witness: I can answer this way. I can say that [fol. 5181] between points A and B in the South, on a particular commodity, under certain conditions, a general level of rates might be departed from.

Commr. Splawn: That wasn't my question. I am sorry; my question was, did you understand the purport of the Commissioner's testimony to be that the South wants, by and large, the same rates within the South, from and to the South, all territories and all commodities?

The Witness: Generally speaking, that is true, yes, sir, and that was the reason I was going on to explain these exceptions.

Commr. Splawn: All right, that is enough. Just a moment. Do we have that kind of a case here?

The Witness: No, sir.

Commr. Splawn: How much of that is involved here?

The Witness: Well, as far as I understand the scope of the proceeding, I was somewhat confused, I think like every one was in the beginning, that these so-called percentage rates or column rates were a part of the case but it was later held that they were not.

So far as my approach to the case is concerned it is specifically directed to the class rates governed by the classifications and my testimony dealt with it from that angle entirely.

This other expression of views about what the level should [fol. 5182] be as a whole I think is outside of this case. We will reach that at some later date, maybe.

Commr. Splawn: Now, these class rates, in working with the class rates and the scales, trying to see what would fit and whether or not there should be any changes, will all this testimony about levels and guesses as to what indices, and one thing and another, be of much assistance?

The Witness: I think not.

Commr. Splawn: To get right down to what might be of some assistance here, it was suggested, taking this part of the case that you say is before us, merely the class rates, it has been suggested that the rate in Official Territory would be acceptable all around; some witness suggested that.

The Witness: Well, I did.

Commr. Splawn: Well, would you say that the Appendix E Scales should be applied throughout all this region?

The Witness: Not as such. I was dealing more with the Index 100 rate there than I was the lower relationships to the Index 100 rate.

I realize, of course, that it is impossible to recognize, for instance, 40 per cent of 1st Class on 6th Class in the South, as against 27½ per cent of 6th Class in the North. Those have got to be reconciled some way, but if you start out with a common Index 100 rate it isn't going to be difficult to find where the other class of traffic should fall. These have got [fol. 5183] to be reconciled some way, but if you start out with a common Index 100 rate, it isn't going to be difficult to find where the other class of traffic should fall.

Commr. Splawn: Let's see if it would be so easy.

Within Official Territory do you have that perfect uniformity?

The Witness: As to class traffic, yes. You have a uniformity as to percentage relationships. There is no difference in Trunk Line, New England, or C.F.A. or I.F.A.; as compared to 1st Class rate it is all 27½ per cent of 1st Class if it moves on 6th Class.

It isn't the same condition that existed prior to the Eastern Class Rate Investigation where you had this percentage of 1st Class in different sections of Official Territory.

Commr. Splawn: Your desire then is to simplify the computation of class rates?

The Witness: On class rate traffic, yes, whatever that is.

Commr. Splawn: You are not so much interested in the application of a particular percentage?

The Witness: No.

Commr. Splawn: That is, if we find, as Mr. Jansen recommended, that the differential would still be applied to New England you wouldn't have any objection to that if it were calculated on some percentage of the appropriate [fol. 5184] classes in Official Territory.

The Witness: As a mathematical matter, no, but I do not want you to understand that I could subscribe in any way whatever to Mr. Jansen's proposals, but mathematically that, I suppose, would be all right.

Commr. Splawn: We have that problem as to whether or not New England should be on the same level with New York State.

The Witness: Certainly the Southern interests haven't any objection for New England to be placed on the same basis, but we have approached a realistic problem in this case, Mr. Commissioner, because we haven't this principle of rate-making whereby this Commission and the railroads were using these two Index 100 rates, one which was 38 per cent higher than the other, as a measuring rod for the establishment of rates on the important classes of traffic.

That is our principal concern here, is to get a common Index 100 rate thereby having it reflected in a common index level on some class of traffic that might be properly related, say 30 per cent of that, unless some unusual condition was apparent that didn't require it.

Commr. Splawn: All the existing column rates would be adjusted to it without changing the real rate at all.

The Witness: You could still make a common Index 100 rate and then adjust it so our rates would still be 100 per cent higher, I agree with that, but of course that is another [fol. 5185] mathematical calculation.

Commr. Splawn: But that isn't involved in this case.

The Witness: No, it is not.

Commr. Splawn: And it does not necessarily follow, does it, that because some plan for simplifying the publication of class rates would be devised that your rates should be either increased or decreased as such?

The Witness: No, I think this, Mr. Commissioner, approaching it from a realistic standpoint, if you set a common Index 100 rate, for instance, just say between the points in that section of the country east of the Mississippi River governed by uniform classification, that immediately thereafter you would have a complete overhauling or revision of your so-called commodity traffic.

That followed the prescription of rates in Docket No. 13494, and in Docket——

Commr. Splawn: And in Docket No. 13535 and in Docket No. 15879. That same evolution would take place whenever this Commission, for good reason, might find that the rate structure, so far as the class rate structure, should be examined. That would be subject to conferences and negotiations between the railroad and shippers, and if they couldn't arrive at an understanding as to the level of rates on a particular class of traffic then they would have to come to this Commission and let them fix it, and in that evolution the revenues of carriers would have to be preserved and rela- [fol. 5186] tionships would be watched by all shippers with reference to Section 3, and so forth.

The Witness: Yes, sir, I think by all means. Of course you would find, this Commission would find, if that evolution took place in the near future we will say, that the conditions that have obtained heretofore, or certainly immediately after the Commission decided the Southern Class Rate Investigation as to the composition of traffic, for instance, in the South vs. the North is entirely different and it would have something certainly new before them.

Commr. Splawn: The same law would apply to all those adjustments that apply now.

The Witness: Yes, sir, I think there would be no need to change the law.

Commr. Splawn: Then I am wondering why in this case if it is just a matter of these classes, whether it should be uniform classification, we can't get our minds on that and leave off so much speculation as to possible differences in rate levels which may or may not continue.

The Witness: Well, of course, the rate structure is always in a state of flux. I don't suppose you could saw it off at any one time and say this will stop right here now and take a new check, but I believe this Commission could, in the [fol. 5187] light of present conditions, cast at least a new class rate structure in these territories. It is just another step in the evolution of things.

When the general class rate cases in all three territories were before the Commission we had different rate levels and sub-rate levels even of those territories.

Commr. Splawn: If we accomplish that, I want to ask you, we have not brought about this ideal equalization of all rates and levels throughout all this territory east of the Rocky Mountains, have we?

The Witness: No. If in the wisdom of this Commission you still found a rate level on a given class of commodity from the South or West or in Official Territory should be higher than in that territory you would still prescribe it, I suppose, but of course you would have to have before you sufficient evidence on which to do that with due consideration to Section 1 and Section 3 and Section 15-A.

Commr. Splawn: You would not say that there would be any implication in any finding that should be something near uniformity in classification, you would not say there would be any implication in that people's rates would logically and inevitably — changed as a result, would you?

The Witness: I don't think so.

Mr. Nofman: Do you mean on other than class traffic?

Commr. Splawn: Yes.

[fol. 5188] The Witness: No, I was going to answer that in the negative if in the event you were referring to all traffic.

Commr. Splawn: Yes, that is what I was talking about. There is much talk here about all traffic and you are putting in so much time here about this rate level that I want to see if it has any significance in your mind particularly.

The Witness: It has a lot of significance, Mr. Commissioner, but I want to remind you that I didn't start this. Somebody else started it and I am trying to keep you straight about it.

Commr. Aitchison: I wonder whether or not this proceeding has as narrow a scope as the answers to Commissioner Splawn's questions would seem to indicate.

With the exception of coal and live stock and money, perhaps, and things of that sort being excepted, virtually every commodity, finds its place in the classification, does it not?

The Witness: Yes, it is in the classification problem.

Commr. Aitchison: And that is an issue we have before us.

The Witness: Yes, sir.

Commr. Aitchison: As to whether or not we can improve on the present three classifications in some way either by combining them or correcting them as they stand.

The next problem we have is the making of a class scale, is it not, from the articles so classified, which will be [fol. 5189] reasonable if applied to them, leaving of course ample room for exceptions to be made when they can be justified. Isn't that right?

The Witness: Yes, I think that is correct.

Commr. Aitchison: Is that the way you understand the issues?

The Witness: Yes.

Commr. Aitchison: Then we do have before us virtually every commodity in some form.

The Witness: So far as the level——

Commr. Aitchison (Interposing): But we are not trying out the question as to whether the existing exceptions are reasonable.

The Witness: Yet I think that may be a proper way to put it. In other words, you do have before you the existing rate level on lumber so far as it is in the classification, and I foresee under conditions we have been talking about that the uniform classification might readily adjust the rates on many classes of traffic satisfactorily to the shippers and the carriers alike and remove them from either column rates or commodity rates and put them in the classification. That is perfectly evident that a good many classes of traffic could be treated after some common Index 100 was arrived at.

Commr. Aitchison: I don't think in the prepared statement you have touched upon this matter. There has been [fol. 5190] testimony here that we have virtually achieved uniformity of classification with respect to the first three classes.

The Witness: So far as the classification itself is concerned; it is achieved.

Commr. Aitchison: And there, of course, with respect to those three classes we must give consideration to the level of the actual rates being charged upon those classes, and then also the question as to whether there is a proper balance between those classes and the remainder of the traffic.

The Witness: You can take the largest moving class, which is 70 per cent of 1st Class; I think by far and large that is the class that moves most of the traffic certainly in the South, and between the South and the North, but you will find that there is a uniformity of classification on many of those articles. The classification is 1st Class, but the Southern carriers have reduced that rate to 3rd Class, or 70 per cent of 1st Class.

That happens to be the same as 1st Class in the North as to level, approximately the same. There may be one or two cents' difference here or there, so there you have a common level of rates on that important moving traffic.

That has already been accomplished by one set of carriers adhering to the classification proper of 1st Class and the other set of carriers reducing their rating to make them equal.

Commr. Aitchison: Do you care to express an opinion on [fol. 5191] the question which was asked this morning as to whether the Official Classification is in your judgment reasonably adapted to the commercial needs of the South.

The Witness: Well, I wouldn't admit that as such it is adapted to the needs of the South. That is due entirely to the difference in relationship of 5th and 6th Class in the two territories.

We might get to the rate level on a commodity that is covered by those classes and find that the rate level is nearer the same, but as to the classification rate level, it is much different.

Commr. Aitchison: I am talking about classification.

The Witness: If you were going to cancel the exception ratings in the South and adopt the Official Classification, I wouldn't——

Commr. Aitchison (Interposing): I haven't said that at all. I am asking whether by and large we were starting out to write a classification, leaving with the rate-maker the right, which I think everybody admits he must have, to make reasonable and necessary exceptions—in fact requires him to make reasonable and necessary exceptions—is the Official Classification reasonably adapted then, in your judgment if you care to express it, to the needs of the South?

The Witness: Well, from strictly a classification standpoint, I would say that it is.

[fol. 5192] Of course I am confronted with the problem of rate levels more than I am about the way it is stated in the classification. That is the reason I can't get away from rate levels.

For instance an article may be rated 6th Class in the North and move on 6th Class which is 27½ per cent of 1st Class. It moves in the South on 22½ per cent which is the same level, in rate level, but therefore, so far as that particular class of traffic is concerned it wouldn't make any difference to us if it were stated at 22½ per cent of Appendix E 1st Class Scale or not, it represents the same rate level, so I think by far and large that perhaps if we took Official Classification as such it would not do violence to the South.

Commr. Aitchison: We scarcely can make rates on the theory that something is going to do violence.

The Witness: Well, I expressed it that way. You apparently had something in your mind that it would perhaps——

Commr. Aitchison (Interposing): Well, yes. I have this in mind, that we are being asked here to put in one uniform classification.

The Witness: That is correct.

Commr. Aitchison: I want to find out what classification you want down South that you think is particularly adapted to your needs. It has to be uniform.

Do you want to have your Southern Classification pro-[fol. 5193] jected over adjacent territory or do you want the Official brought in or do you want the Western? You have those three.

The Witness: I would say that perhaps each one of the classifications would bear some revision and bring them together, and I think that would be necessary.

Commr. Aitchison: In other words, a new classification.

The Witness: That is correct. In other words, there would be some over-lapping there that we would have to reconcile but it is simple. It is not difficult at all.

Commr. Aitchison: Well, is it so simple that you have not felt it worth while to come to us with any suggestions as to what that classification should be?

The Witness: I haven't thought it was too difficult. Certainly we were not prepared at the time this case was set for hearing to go into the full classification. We were not prepared to do it. We were not equipped.

Commr. Aitchison: The principles of the classification have been stressed from the beginning. We have had witnesses here representing the three classification lines who have attempted to tell us what the principles were underlying their classifications.

The Witness: They were all historical.

Commr. Aitchison: Well, historical or not, they are the principles that exist, according to the witnesses at the present time.

[fol. 5194] Have you got any sort of principles you think we ought to apply that you can give to us?

The Witness: No; if I had the time I think I could suggest the uniformity of classification in the three territories that probably would be satisfactory.

Commr. Splawn: And how many years do you say you have been working on this?

The Witness: I am probably not being tried for being dilatory in trying to get up a new classification, but still I am not talking about the physical efforts that might necessarily be required to put it together. I am talking about the mental efforts, so to speak. Of course it is going to take some time.

Commr. Aitchison: You are going to be asked, when you come to write your brief, to give us suggested findings. When it comes to a matter of uniform classification I take it from what has been testified here you are going to urge that.

The Witness: Naturally.

Commr. Aitchison: What kind of uniform classification? On what principle should that classification be constructed?

The Witness: I will admit so far as my own interests are concerned that the record certainly isn't clear as to what it should be.

It may be that we will have time between now and brief date to give you something. We discussed that at some [fol. 5195] length between us and it was found impracticable, I will put it, at this period to work out a uniform classification. Although we might have ideas as to how it should be done, we didn't have the means with which to do it.

Commr. Aitchison: Yet it is being suggested that this Commission should do it in nine months.

The Witness: No. I would think perhaps this Commission should admonish the parties to get together and agree on a classification. I don't think we would have much trouble. I mean if you meant business. I don't mean just take it as you did in the beginning and the Commission set out as soon as it was organized in 1887 and got after these railroads about uniform classification, and it got hotter and hotter until about 1914 and then the Commission quit and they just couldn't get the railroads to get together.

There was a difference of opinion of the railroad classification people, such as our friend, Mr. Fyfe, and those old fellows, and they just wouldn't get together and you couldn't get them together today and they are not going to agree, but if they had a mandate from this Commission to get together and make one, or you would make it, they would make it.

Mr. McCollester: Do you think there is such authority in the law?

The Witness: No, I don't think so, but I think this Commission could prescribe a uniform classification if it desired [fol. 5196] to do so.

Commr. Aitchison: I thought you had some evidence on that.

The Witness: We will try to give you something in brief on it. I didn't have any set principles that I would like to——

Commr. McConnaughey (Interposing): You suggest combining the classification of the three territories to come out with one which you suggest would be operatable. Would that have the effect of changing the rate level in any one of those three territories from what it is today?

The Witness: It might change the rate level on some particular class of traffic and that change might be perfectly acceptable to both the railroads and the shippers; I don't know. It is conceivable that change, whether it be up or down, might be satisfactory to all parties.

Mr. McCollester: It would be up if it was different from Official Territory.

The Witness: Yes, if it moved on the classification basis in Official Territory.

I am sorry, Mr. Chairman, I am not prepared at the moment without consulting with my other people to commit myself regarding any set formula, but I will.

Commr. Aitchison: I just want to say this. Mr. Hart, you are here as an individual witness giving us your best [fol. 5197] independent judgment on any of these questions as an expert, and it was in that capacity that I asked you if you had any views with respect to classification that you cared to express. I don't care to press you for your views if you think they are immature.

The Witness: Well, they are to a certain degree.

Chmn. Alldredge: I am afraid I might start another discussion on this, but if the uniformity is attempted do you think that more difficulty would be encountered on the classes below 4th than above 4th?

The Witness: Undoubtedly.

Chmn. Alldredge: Do you think if you approached it from that standpoint that it would be an easier task—I see some smiling back there, I suppose that maybe some of the rest of them are prepared later to give us better suggestions—but if you attempted it do you think you could more readily reach the reconciliation between the three separate classifications now with respect to the classes from 4th and above than you could below 4th?

The Witness: Undoubtedly, because those classes today are practically uniform.

Commr. Aitchison: Is 4th?

The Witness: I know of course that 4th Class in the North is 50 per cent of 1st Class and it is 55 per cent in the other territories but in discussing these things I approach [fol. 5198] it from the standpoint of rate levels rather than just figures in the classification.

Chmn. Alldredge: Isn't it a fact that so far as less than carload traffic is concerned there is virtual uniformity?

The Witness: Yes.

Commr. Aitchison: Thanks very much. We have interrupted you, but if you will continue with your statement.

The Witness: I doubt if it has been of very much benefit to you. I am sorry I couldn't give you a full formula.

Mr. Bell in his concluding remarks concerning his Exhibit No. 167 appears to be critical of the general position of the shippers throughout the country who have testified in this case in favor of a uniform classification. In my opinion the historical development of our present classification should be looked into to see what, if any, consideration was given to the efforts of this Commission to bring about a uniform classification in the past.

In his Exhibit No. 168, Mr. Bell presents a purely academic comparison to show the result of substituting the Official Classification proper on traffic rated 3rd Class and lower and the Appendix E. Docket No. 15879 Class Rate Scale in Southern Territory for the Southern Classification proper rating on the same classes of traffic applied to the Southern K-2 Class Rate Scale, Docket No. 13494.

Likewise, he reverses the comparison by substituting in [fol. 5199] Official Territory the present Southern Classification ratings and the K-2 Class Rate Scale, although the caption on the last six columns shown in Section A of this exhibit is not entirely clear in this respect. The theoretical comparisons assume a one dollar 1st Class rate in Official Territory and a $1.38 1st Class rate in Southern Territory.

If all traffic included in the comparisons moved on the Classification proper ratings shown therein, then perhaps the comparisons would be of probative value. I agree with the evidence which I have heard introduced by both shipper and railroad witnesses in this case that the classification proper ratings in both territories are used in the breach rather than in the observance.

Witness Morris, at the Columbus hearing, referred to the relative heavy north-bound tonnage of Manufactures and Miscellaneous commodities included in Group V of the Commission's Freight Commodity Statistics.

To me the figures he gives indicate that this group comprised a rather large percentage of the total north-bound tonnage when coal is omitted. However, Mr. Morris failed to submit the consist of this tonnage so the Commission might know what portion of it actually consisted of raw materials such as: Molasses, Blackstrap; Pig Iron; Aluminum, ingot or pig; Vegetable Oils; Woodpulp; Scrap Metals; Scrap Iron; and so forth. Included in this group [fol. 5200] also are numerous commodities considered semi-raw materials, which have been processed to some degree in the South, but are further processed into finished commodities in the North.

Such group includes: Rough Textiles; Alcohol; Chemicals; Aluminum; Vegetable Oils (Refined); Paper; printing; Fertilizers, NOS; Alloys; Sugar, and so forth. The commodities I have mentioned are not all of the raw materials or semi-raw materials that move from the South to Official Territory included in the Manufactures and Miscellaneous Group.

I consider statements of this character should be further broken down to show to what extent the rates on these materials into Official Territory from the South are relatively lower than within the South. Likewise, it should be borne in mind that included in this group of commodities, for instance, is Cast Iron Pipe, a very heavy moving commodity from the South on which a common rate level applies east of the Mississippi River.

There are other manufactured commodities included in this group which are manufactured to the degree for consumer use, on which the rates are but slightly higher than the level of rates applying on the same commodities in Official Territory.

In Section 1 of Witness Morris' Exhibit No. 180, sheets 1 to 33, inclusive, he undertakes to show the effect, as far as rates are concerned, of applying the Official Territory [fol. 5201] rate level under the Official Classification ratings proper, or exceptions thereto, in the different classes of traffic listed in this section, although not claiming that there is an actual movement of same from Atlanta, Ga.

While the showing is, of course, more or less academic, nevertheless, because Mr. Morris stated that he considered this section of his exhibit the most important part of it, and because his explanation of it on pages 4037, 4038 and 4039 of the record, does not make it clear that the rates shown as "Present Rates" were or were not intended to represent the actual published rate—although this would certainly be inferred from his explanation of the exhibit beginning at page 4039 of the record—I believe it is important that I point out the fact that the rates shown under the column headed "Present Rates" from Atlanta are not, in numerous instances, the actual rates, but rather represent the column ratings provided on such traffic in exceptions to the classification.

While I have not made a detailed check of the exhibit for the purpose of verifying its correctness in every respect, nevertheless, a casual examination of it discloses discrepancies in the present rates on commodities produced and shipped from Atlanta, Ga.

For instance, Line 17, Sheet 2, shows the rates on Agricultural Implements, carload, from Atlanta to Louisville as 61 cents. The applicable rate is 49½ cents.

[fol. 5202] Line 10, Sheet 5, the rate on coal and wood stoves, carload, from Atlanta to Louisville, is 33 cents. The rate shown to Chicago is also incorrect.

The rates on Stone, beginning at Line 34, Sheet 20, are incorrect. For instance, the rate to Louisville on Dressed Stone is 32 cents, and to Chicago 42 cents.

On Line 18, Sheet 23, rates on Leather from Atlanta to Chicago are on the basis of 30 per cent of 1st Class rather than 37½ per cent.

Sheet No. 23, lines 8 and 10, Pig Lead or Slab and Sheet Lead, the rate is 42 cents to Louisville, and not 50 cents.

Sheet 24, Line 32, Packing House Products to Louisville, the rate is 51 cents and not 57 cents.

Sheet 26, Line 33, Excelsior Packing Mats, the rate is 37 cents and not 66 cents.

On Sheet 2, Lines 33 to 37, inclusive, are shown rates on alloys for steel manufacture. While these alloys are not manufactured in Atlanta, they are produced in volume at other points in the South, such as Charleston, S. C., and the Alabama steel district; but as Atlanta, Ga., is used to illustrate the point Mr. Morris is making, it should be noted in this instance that the Official Territory exceptions ratings on Ferro-Phosphorus (Line 34), Ferro-Silicon (Line 35) and Silico-Manganese (Line 37) is 27½ per cent of 1st Class.

[fol. 5203] However, Mr. Morris no doubt knows, the first two alloys mentioned above move within Official Territory on rates the same as on billets and very much lower than 27½ per cent of 1st class.

There are other instances of this character that could be pointed out. However, I have selected this one because it is an important commodity produced in the South; and the showing which Mr. Morris has made with respect to the rates on these steel alloys is so impressive as to raise in my mind the question whether the facts are correctly stated in the exhibit, in the event it is supposed to include a comparison of the present rates on the different classes of traffic shown in this section of the exhibit. Naturally, these differences would very materially affect the summary shown on Sheet 24.

However, I am inclined to believe that Mr. Morris did not intend for the exhibit to show the actual rates in effect on the different classes of traffic covered by this section of his exhibit to the extent that they were different from the rates that would result by applying the published exceptions to the classification. If this was his intention, naturally, it can be cleared up by him; but even this would not take care of the discrepancy pointed out with respect to the rates on steel alloys.

Likewise, in instances wherein the traffic actually moves on exceptions ratings, the competitive rate situation at the [fol. 5204] Ohio River or at Chicago is not disclosed with respect to commodities that actually move from Atlanta, nor the manner in which they move.

For instance, on lines 32 and 33 on Sheet 5, he shows the carload rates and ratings on Shoes. While there is a limited carload movement of Shoes from Atlanta, there is no carload movement to Louisville, the movement being entirely in less carload quantities.

Therefore the correct competitive situation at Louisville would be a comparison of the less carload rate from Atlanta, i. e., 116 cents, and the Official Territory rate level, which would be 117 cents per 100 pounds.

Even the carload basis of 4th Class from Atlanta to Louisville does not place the Atlanta manufacturer on a relative competitive basis with Endicott, N. Y., the principal source of competition, because the rates from the latter point on Shoes, carload, to Louisville, Ky., are not on the full Official Territory Classification basis. The rate from Endicott to Louisville is 99 cents per 100 pounds, for a distance of 727 miles, whereas the classification basis is 124 cents.

In any event, the reduction in the Southern Classification basis of 2nd Class on Shoes, carload, to 4th Class by exception, was made necessary by virtue of a reduction made by the Southern carriers on Shoes, less carload, from 1st to 3rd Class, effective September 1, 1940, along with many [fol. 5205] other reductions similar in nature that were made on that date.

On Sheet 11, Lines 1 to 9, carload ratings are shown on Clothing, NOIBN, which is rated 2nd Class, carload, and 1st Class, less carload, in Official and Southern Classifications. By exception, it is rated 70 per cent of 1st Class in Southern Territory, carload and less carload.

However, the movement from Atlanta is altogether in less carload quantities; and this holds pretty well true throughout the country. Therefore, the actual competitive relationship at Louisville would show the Official Territory rates as being 117 cents and not 99 cents. Consequently, the reduction shown in the Atlanta rate from 116 cents to 99 cents is purely a paper one. The same situation is true with respect to Games or Toys, viz; Dolls, Line 26, page 18.

On Sheet 28, beginning with Line 6, a number of Paper Articles are listed that are manufactured in large quantities in Atlanta, Ga., but the movement is entirely less carload on rates that approximate the Official Territory level; and on some of the items they are the same as the carload rates shown on this sheet.

I refer particularly to binders or covers, paper or pulpboard; envelopes; pads; tablets or blank books; school blanks or forms; papeteries; and paper tags. Additionally, exceptions ratings on school blanks or forms, carload, in Official Territory, should be shown as 27½ per cent of 1st [fol. 5206] Class.

To the extent that this section shows actual rates applied on commodities manufactured in Atlanta that are in competition with similar commodities manufactured in Official Territory, it portrays the disadvantage as to transportation cost of the Atlanta manufacturer at such a point as Louisville, Ky., when meeting competition with manufacturers located in Official Territory.

The Exhibit also brings out forcefully the fact that most of the traffic moves within the framework of the class rate structure, by virtue of rates being definitely related to the governing 1st Class 100 rates, and further confirms our position concerning the importance of the 1st Class 100 rates. Also it brings us again to the matter of the proper term to apply to this type of rate, i. e., whether it should be referred to as a class rate or a commodity rate.

It would seem that Witness Morris has finally concluded that perhaps at least the carload rates, although definitely related to the governing 1st Class rate—particularly when they are published as exceptions to the Classification proper —should be designated as commodity rates, although his explanation in this respect, at pages 4051 and 4052 of the record, is not very convincing to me as a rate man. He does not explain why he selects a rating on one class of traffic published in the Southern exceptions along with [fol. 5207] ratings on other classes of traffic, and describes one as a commodity rate and the other as a class rate.

For instance, in response to a question by Mr. Norman, he states, that the reduction made on many classes of traffic effective September 1, 1940, and published in exceptions to the Classification, properly should be considered within the class rate structure, but he includes some of the carload reductions made on this date in Section 1 of his Exhibit No. 180, and treats them as commodity rates.

Probably, after all, it is not material what they are called, except if this could be definitely determined, the Commission and directly affected parties would be less confused when considering rates of this character.

However, their status is fairly detailed on pages 1 to 30 of his Exhibit No. 15, introduced at the Indianapolis hearing; and I prefer to rely on that showing, which, in general, coincides with the information contained in my exhibits Nos. 88 and 90.

But regardless of how these rates are designated, their measure is often controlled by the 1st Class rates operated in the different rate territories. Certainly this is true with respect to rates within the South and between the South and Official Territory; and it is this condition that we are complaining about, because this Commission has recognized that the difference of 38 per cent between the Southern 1st Class level prescribed by it in Southern Class Rate Investigation, and the 1st Class rate level prescribed by it in Eastern Class Rate Investigation, is not warranted.

[fol. 5208]

At page 3977 of the record, Mr. Crane refers to the revenue test made in the Southern-Official Divisions Case, Docket No. 24160, wherein revenue derived from inter-territorial traffic between Southern and Official Territories were tested by rates in effect prior and subsequent to the effective date of rates prescribed in Southern Class Rate Investigation.

Certainly this test does not support the contention he makes concerning the revenue result of the rates prescribed on inter-territorial traffic at the time of the Commission's decision in the Southern Class Rate Case, because the Division Case included many elements not present at the time the Southern class rates became effective, January 15, 1928.

My point was that in the Southern Class Rate Case the numbered classes, particularly the 1st Class 100 rates were made higher than they would otherwise have been, but for the inter-territorial structure that supplanted the prior combination basis between most of Official Territory and the South.

This conclusion is not only supported by the report of the Commission in the Southern Class Rate Case, but by its later expressions and particularly those of Commissioner [fol. 5209] Eastman who had direct charge of the case. Certainly it should not present an enigma to anyone who was intimately associated with the readjustment in the Southern rates following the Commission's decision in the Southern Class Rate Investigation, and bearing in mind the character of the Southern rate structure at that time, coupled with considerations of the carriers' revenues, which I have previously referred to.

Mr. Crane, at pages 3985 and 3986 of the record, treats very lightly the seriousness of the situation confronting Southern manufacturers in competing for business in important consuming areas of the South by virtue of the relatively lower class rates prescribed in the Southern Class Rate Case from Official Territory origins than from Southern origins to the same consuming area, which situation was subsequently aggravated by the Commission's action in further reducing the class rates from Official Territory origins in the so-termed Border Cases.

Apparently, he endeavored to excuse his own railroad and the Southern carriers generally from being a party to the charge of prejudice against Southern manufacturers, by referring to a statement of the Commission appearing at page 575 of the Third Supplemental Report of the Commission in Southern Class Rate Investigation to the effect that:

> "* * * while the Southern carriers have made a point of this situation in their petition dated April 30, [fol. 5210] 1927, * * * nevertheless, the Atlanta Freight Bureau, in a petition filed in answer to the carriers' petition, made no point of the situation."

I expected the Southern carriers to refer to this statement by the Commission; but had Mr. Crane reviewed his files he would, possibly, have been enlightened about the matter, because there was an understanding with the Southern carriers at the time of preparation of the April 30, 1927, petition that we were in agreement with them as to certain points raised in the petition—particularly point No. 5 which dealt with this situation—and therefore our answer was directed only to such points as were in controversy.

The Commission was well informed about the position of the Atlanta Freight Bureau and other Southern shipping interests concerning this point. It was discussed at length by the Commission in its First Supplemental Report in Southern Class Rate Investigation, and is referred to in detail on page 7 of my Exhibit No. 90. Specifically, our position—and that of other shippers located in what is referred to as the Deep South—is stated on page 328 of that report.

This competitive situation however could be cured by the establishment of commodity rates from the Southern origins to so-called Border Territory; but this has never been done.

This situation has been corrected by the observance of the fourth section at intermediate points in Border Terri- [fol. 5211] tory by applying rates established from Southern manufacturing points to the Ohio River and Virginia cities.

To the extent that this has been done on a very limited number of commodities produced in the Deep South it has had the effect of minimizing the preference accorded the Official Territory manufacturers of similar commodities; but Mr. Crane's statement in this respect is inaccurate, for rates on numerous commodities produced in the Deep South are not accorded rates to the Ohio River and Virginia cities on a competitive basis with rates applying on the same commodities in Official Territory.

In so far as the Atlanta shippers are concerned, we have consistently complained to the Southern carriers about this situation since the inter-territorial rates became effective, pursuant to the Commission's report in Southern Class Rate Investigation, and particularly after the situation became more acute because of the practice of constructing rates on most commodities with definite relation to the governing 1st Class rates, coupled with the further reductions in the 1st Class rates from Official Territory to the Southern Border Territory.

I can say with assurance that on every occasion wherein the Southern carriers have proposed to establish rates on commodities related to 1st Class from Official Territory origins to points in Southern Territory, which were rel-

[fol. 5212] atively less, distance considered, than from Atlanta, I have strenuously objected to such proposals, unless they were relatively adjusted, distance considered, from both origins.

Mr. Crane in testifying for the Southern carriers seemed to convey the impression that perhaps the discrimination that I claimed existed with respect to the relationship between the 1st Class rates prescribed inter-territorially between Official and Southern Territories with the 1st Class rates prescribed in the South, in the Southern Class Rate Investigation and the different classes of traffic that were related to those 1st Class rates by the same percentage, probably did not appear as acute as it might seem to be from my testimony, and I did want to make this one further observation concerning that condition, that it reached such a point that so far as Atlanta is concerned we notified two carriers that if they attempted to publish any further rates from Official Territory to Southern Border Territory on the same percentage of the Border cases, 1st Class rate that obtained within the South, that we would necessarily be compelled to contest that before the Commission, and to bear that position out, the first time that was done it involved the rates on certain paper articles that were manufactured in Atlanta, wherein the Southern carriers proceeded to establish rates from St. Louis based on the same percentage of 1st Class that had been established from Atlanta and certain other fabricating points.

[fols. 5213-5214] Those tariffs were filed to become effective on July 25, 1941.

I filed a petition with this Commission seeking suspension of those rates and after the petition was filed the Southern carriers agreed to place those rates on a percentage of the Docket 13494 rates rather than the Docket 21665 rates.

No further attempt since that case was closed has been made to unduly prefer these Northern manufactures.

I thought it was pertinent to this record to show our position with respect to that situation.

Of course, it is perfectly obvious that this situation is not entirely confined to competition between Southern and Official Territory producers of similar commodities in Southern Border Territory, because it likewise causes undue prejudice as between producers of the same commodities located in Southern and Official Territories, when competing for business in Official Territory, particularly in instances wherein the rates are constructed on the percentage of 1st Class formula, whether they be standard percentages or otherwise. I think one illustration of this will suffice.

Further reference to this discriminatory situation in the so-called Border Territory, I want to illustrate that further by selecting the rates on cotton clothing that is manufactured both in the South and in Official Territory.

For this comparison I have selected Chicago as a des- [fol. 5215] tination and Macon, Ga., Greensboro, N. C., and Philadelphia, Pa., as representative manufacturing points of so-called work clothing.

The distance from Macon to Chicago is 817 miles; from Greensboro 808 miles; and from Philadelphia 814 miles. There you have a comparable distance from two Southern manufacturing points and one official territory manufacturing point to Chicago.

The rate from Macon is $1.56; from Greensboro $1.25 and from Philadelphia $1.12.

The lines serving the two Southern origins are the same and certainly there is nothing so far as I know in transportation conditions to warrant those rates being that much different.

That I think illustrates the point that we are particularly complaining about, and which comes about by prescriptions of this Commission wherein the 1st Class Index 100 rate is relatively less from one origin in the South than from another origin.

Commr. Splawn: That was what I was asking a while ago. Would mere uniform classification necessarily change that?

The Witness: Yes, sir, if you had uniform 1st Class rates. The rates on this clothing on this data are rated 70 per cent of 1st Class in the two territories and if you had that common Index 100 rate your rate to Chicago [fol. 5216] would be the same as from Philadelphia $1.12 from all three points competing in Chicago for an equal distance.

Commr. Splawn: That is if there were a uniform rating it would be uniform.

The Witness: It is. It is a uniform rating today, but the only reason why Macon, Ga., pays this greater difference is because of the Index 100 that this Commission prescribed.

Commr. Splawn: Isn't there probably something more fundamental than that?

The Witness: I don't think so, not in this case. There is nothing fundamental about it except that on work clothing the Southern carriers decided to put — in 3rd Class or 70 per cent of 1st Class. The Northern carriers maintained a level of 1st Class.

The complaint was brought before this Commission and it found the rates should be 70 per cent the same as in the South, so there you made the rates the same, I mean the percentage the same.

Commr. Splawn: The percentage the same but did not make the rates the same.

The Witness: No, but you didn't consider that in those cases at all and by virtue of doing that then you cause the man at these Southern points to pay a higher rate, mile for mile, than does his competitor at Philadelphia, whereas before that he was on an equal basis. You took that away from him.

[fol. 5217] Commr. Splawn: The Commission fixes relationships?

The Witness: Of course that wasn't involved in the Northern case on work clothing. They merely brought a case under Section 1, and you held under Section 1 a reasonable rate level on work clothing was 3rd Class rather than 1st Class. When you did that, that automatically increased the disadvantage of the Southern producer; whereas it had been equal before you created a difference of 138 per cent.

Commr. Aitchison: Was he in that case as an intervener?

The Witness: No, sir, he was not because I don't suppose the Southern manufacturers had advice about the case at all.

Commr. Aitchison: Was that point raised before the Commission?

The Witness: I think not, sir. That is in effect today. You automatically took a competitive basis away from us by that action, and that is what we are talking about here is about this control of these rate levels by the Index 100 rate.

Commr. Aitchison: If it violates Section 3 of the Act it seems to me there is a remedy.

The Witness: Yes, I agree with that. I was merely using that as an illustration to show this Commission why we are complaining about those Index 100 rates.

Commr. Aitchison: As long as we recognize the right [fol. 5218] and probably even the duty, of the carriers to make exceptions when required and their right to make exceptions within that proper sphere of managerial discretion, is there any way to maintain uniformity of rates between the two territories or even within a territory except by the prescription of minimum rates.

The Witness: I think under Section 3 the Commission can do that unless there was some competent evidence to the contrary.

Commr. Aitchison: Would you advocate as a part of our findings in respect of an attempt to get uniformity in class scales that we should make a condition similar to condition 27, I think it is, in the Consolidated Southwestern?

The Witness: I have said that. I don't think I have ever made an effort to have rates established into the Southwest that I was not confronted with that finding 27, whether it was real or not, but I am convinced as a last resort that I would rather take that than what I have got and work under it. It is bad, I agree with you.

By Mr. Norman:

Q. Mr. Hart, if you had a uniform scale, a uniform classification, if there were special conditions and circumstances which justified the departure as to certain traffic in certain sections could not that be handled with suspension proceedings if the carriers exercised their managerial judgment and published them, if they could justify them they [fol. 5219] could become effective, whereas if they couldn't justify them as being non-discriminatory they wouldn't.

A. That sort of plan was followed out in the Consolidated Southwestern cases by virtue of I & S Docket 3103.

Q. Isn't that sort of situation very much preferable to the old way?

A. Yes, but I expressed the view to the Chairman that if that was the only means by which we could secure what we wanted I would take it rather than what I had, and try to work under it.

It is a fact as testified by Witness Morris appearing for the Southern railroads, that the class rates prescribed by the Commission in Southern Class-Rate Investigation and subsequent Border cases were not those the Southern railroads advocated (Page 18, Exhibit No. 15).

This prejudicial situation is one that is clearly unjustified; and we are insistent that the Commission correct it.

Mr. Crane, in discussing pages 11 and 12 of my Exhibit No. 90 (Record, pages 3987 and 3988), again loses sight of the point I was making, which was primarily directed to the controlling influence of the 1st Class 100 rate in constructing rates on various classes of traffic related to the 1st Class rates, which we reiterate disregards conditions that necessarily should be considered when changing the general level of rates on a given class of traffic. [fol. 5220]. I am glad he referred to the Southern Textile Case to support his statement in this respect, because it really illustrates and supports my statement of which he is so critical.

In the Textile Case the Commission prescribed a percentage of the governing 1st Class 100 rates on piece goods from the South to Official Territory.

Subsequently the Southern and Southwestern rail carriers found it necessary to re-establish the prior parity of rates with New England at Chicago. This caused a wide origin blanket in the South—in fact, one more extensive than had previously existed. This blanket is shown on a Map Exhibit No. A-183, which I introduced in the reopened Southern Textile Case.

Because of the observance of the 4th Section, the Chicago rate also causes a substantial destination blanket.

On pages 3999 to 4001 of the record, Mr. Crane discusses Section III-B of my Exhibit No. 88. He seems to criticize the manner in which I arrived at the approximate rate levels, although he offers no better way to arrive at them, merely contenting himself with the abstract statement that this method of comparing the rate levels is incorrect, because the 1st Class rates from the South to CFA and IFA territories will not average as high as the 1st Class rates under the Southern Territory 1st Class scale; but [fol. 5221] he offered nothing in evidence to support his conclusions although he attempts to illustrate the point by selecting a commodity which is produced in Memphis, Tenn., rated Class 30, or 30 per cent of 1st Class, as compared with Class 35 rating in Official Territory.

Of course the 1st Class rates from Memphis, Tenn., to this section of Official Territory are lower than if the full K-2 1st Class scale were applied from Memphis; but, on the other hand, if the 1st Class rates from Jacksonville, Fla., were selected, it would be found that they exceed somewhat the full K-2 Southern 1st Class scale. True, the particular commodity to which he refers, i.e., acetic acid, is not at the present time produced in Jacksonville, Fla., but it is the preferential character of the governing 1st Class 100 rate that causes the rate on a given commodity from Memphis, Tenn., to Detroit, Mich., to be made lower, relatively, than the rate on the same commodity from Jacksonville, Fla., and that is what we are complaining about.

The East Tennessee Section is a potential producing area of this commodity. If the 1st Class rate from Knoxville to Detroit is compared with the 1st Class rate from Memphis in relation to the K-2 1st Class Scale, it will be found that the present Knoxville 1st Class rate is 7 cents less than the scale, whereas the Memphis 1st Class rate is 22 cents less than the scale.

Mr. Crane fails to explain what conditions in his opinion [fol. 5222] warrant the Southern Railway, for instance, serving both Memphis and Knoxville, charging the Knoxville producer of a commodity rated Class 30 higher relative rates than a Memphis producer. These comparisons of the 1st Class rates with the K-2 1st Class Scale, and others similar in character, are shown on Sheet 3, Section II, of my Exhibit No. 88.

On page 44 of his Exhibit No. 152 Mr. Rive purports to test the relative rate level on lumber, carload, in Official and Southern Territories.

There are shown opposite certain mileage blocks on this exhibit the percentage that the Southern Territory rates represent of the Official Territory rates. There is nothing on the exhibit, nor can I find anything in Mr. Rive's testimony, that would indicate just what those percentages represented.

I do find, though, on testing the exhibit that it represents that cumulative rates at 100 miles in each territory, for instance, and the percentage that those cumulative rates bear to one another.

In other words, at 300 miles he merely takes the cumulative rates at the Southern scale from 1 to 300 miles and finds a total and performs the same operation with Official Territory Scale and then relates the two cumulative results to show this percentage, which I believe would be unfair and does not test the rate level by any means on this [fol. 5223] particular commodity.

So that the Commission might know the exact difference between the two levels at these mileage blocks I have prepared a study shown in Table A, Sheet 2, of my Exhibit No. 220.

There you have an exact percentage relationship of the two scales at those distances.

I am not claiming that the difference shown in this table here represents the actual difference in the level of the rates on lumber without first having before me an accurate traffic test to show how this lumber moved in both of the territories.

For instance, there is quite a substantial movement in the South for longer distances, and this was questioned at the Indianapolis hearing when I submitted my exhibit for the purpose of comparing the rate pattern and not the rate level on lumber, and someone questioned the fact that there were no distances in Southern Territory of 900 miles and in this connection I call your attention to Sheet 3 of my exhibit wherein I have selected important lumber producing points in the South and important lumber consuming points in the furniture district in North Carolina.

You will observe there that those distances are quite long and there is a very substantial movement from the Mississippi Valley and Memphis particularly, to this Carolina [fol. 5224] furniture district, so if you test the rate levels at these longer distances you will find that the Southern scale is not related to the Northern scale, as Mr. Rive would have you understand it by Sheet 44 in his Exhibit No. 152.

On Sheet 46 of his Exhibit No. 152 Mr. Rive makes a similar comparison of the rates on scrap iron, and I have shown in Table B, Sheet 2, of my exhibit just what the rates are at the actual mileage breaks shown on the exhibit.

Mr. Rive in making his comparisons on Sheet 46 uses the same formula that he used with respect to lumber. In other words he takes the cumulative rates for those distances and adds them together and finds a relationship, which of course is not correct.

Further, Mr. Rive's figures were taken from my Exhibit No. 88 submitted at the Indianapolis hearing, which was, so far as the rates on scrap are concerned, in error and Mr. Bell detected that error and corrected it in his exhibit that he filed later on in Columbus, so Mr. Rive's exhibit is found in error to that extent.

I believe Mr. Widell at the Columbus hearing referred to rates on one particular commodity—I believe it was Anti-Freeze—on which the rates were apparently properly adjusted immediately upon the matter being called to the attention of the railroads, from Nashville, Tenn., to destination in the South and Official Territory.

[fol. 5225] Upon returning home I checked on this matter and find that Mr. Widell is correct, that certain rate adjustments were made in the rates on a compound produced in Nashville, Tenn., and described as Anti-Freezing Compounds Liquid.

Those rates were established representing a level of about 120 per cent of the Northern level. Whether or not those rates were satisfactory to this particular Nashville producer I am unable to say but it is a fact that the rates were not established on the Official Territory level.

There is just one other observation, Mr. Chairman, I would like to make in connection with this scrap iron situation.

Of course Mr. Bell and Mr. Rive compare the Southern and the Northern level but I don't think it should be overlooked that in the Southern States particularly we have rate levels on scrap iron that are not the same as the interstate level; for instance the rates in Alabama are higher than the interstate rates, and wherever there is a movement they reduce the rates to the interstate basis, and we have rates in Georgia that are lower than the interstate basis so that paper comparison doesn't mean anything when it comes to an actual weighted rate level on scrap iron.

I want to refer briefly to the testimony of Messrs. Oliver and Tilford introduced on behalf of the Southern carriers—particularly the former—beginning on page 3802 of the [fol. 5226] record, particularly with reference to northbound competitive rates from the South, as this testimony could easily be construed to convey the impression that "all is well," so to speak, and that the Southern shippers generally are satisfied with the present class rate situation, and that a Southern processor, whatever his product, has no difficulty in securing satisfactory rates into official territory, and that even if this cannot be accomplished in the first instance by voluntary action, he would have little difficulty in securing the rates desired by an appeal to this Commission, because of some principle announced in its decision in the so-termed "Southern Governors' Commodity Rate Case"—Docket No. 27748.

He correctly states that no one has pressed a formal complaint before the Commission covering rates on Southern processed commodities into Official Territory since the decision in that case, but he is incorrect in assuming the reason for this is because no Southern shipper is dissatisfied with his rates to Official Territory.

There are now two inter-territorial cases pending, one covering textiles, which has been heard in a reopened hearing proceeding, and the other covering packing house products, and so forth, which has not been heard. However, this does not mean that numerous Southern shippers desiring to market their products, or who may now be marketing them in a limited way, in Official Territory, are satisfied with the rates charged on their products, because of compe- [fol. 5227] tition which they meet in that territory.

I believe it would be correct to say that a good number of such shippers are awaiting the outcome of this case before proceeding in this manner. I know that in some instances the industry does not feel that the expense incident to the prosecution of a case before the Commission is warranted.

True that when a Southern processor can prove to the satisfaction of the Southern carriers that there is a need for rates into Official Territory to meet competition, they are generally willing to suggest them to the Official Territory lines. (Tilford, p. 3889). But the matter then usually reaches a stalemate.

With but few exceptions, agreement on the part of the Official territory carriers in rates equal to those applied on the same classes of traffic in that territory is confined to either raw or semi-raw materials that are to be further processed in Official Territory. Mr. Oliver mentions some of them, such as:

Rayon, Aluminum Products, Cast Iron Pipe, Tobacco, Furniture, Textiles, Alloys (Steel), Wood Pulp, Papers and Board.

Of the completely processed articles, i.e., furniture, tobacco, some types of textiles and certain papers, the inter-territorial rates, generally, are higher than are the rates in

5

[fol. 5228] Official Territory. On cast iron pipe there is a common rate level east of the Mississippi River which was fixed by the Commission.

The other major commodities he mentions, i.e., alloys, wood pulp, aluminum products, pulpboard and particular types of textiles, are in the nature of semi-raw materials, that are shipped in volume into the North for further processing.

The carload rates on rayon yarn, which represents the principal movement of rayon products from the South to the North, and which is produced at the large operations mentioned by Mr. Oliver as being located in western North Carolina and northern Georgia are on a level slightly higher than those applying in Official Territory.

The rates on aluminum products, such as bar, plate, sheet, and so forth, from Alcoa, Tenn., to Official Territory, established for the Aluminum Company of America, approximate the Official Territory level. Similar rates were established from Listerhill, Ala., for the recently constructed Reynolds Metals Company plant, except that the rates from the latter point to some of the principal consuming points in Official Territory are less, distance considered, than if the Official Territory level were applied.

The present rates on wood pulp from the Southern pulp mills, to the extent that through rates are published, are comparable with rates on this commodity within Official Territory. A revised general adjustment has been agreed upon with respect to this commodity, wherein the Official Terri- [fol. 5229] tory level is to be established to the border cities and north thereof, i.e., 22½ per cent of the Appendix E 1st Class Scale; and within Southern Territory the level is to be made 17½ per cent of the K-2 1st Class Scale, and represents a rate level approximately 10 per cent higher than the Official Territory level. On alloys, specific rates are published from Southern producing points to specific destinations in the North that are comparable with the rates in the North.

There is another important new production of semi-raw material in the South, although it was not mentioned by Mr. Oliver. That is synthetic rubber. Rates have been approved for publication into Official Territory on the Official Territory level. It is significant to know that the rates on processed rubber articles, such as tires, from the Southern manufacturing points to Official Territory are very much higher than the rates in that territory.

The commodities referred to by Mr. Oliver, on which rates have been voluntarily established, and are as low as, or only a little higher than, the rates in Official Territory, are strictly raw materials or materials that are to be further processed.

Mr. Oliver also mentions harness and saddlery and certain classes of machinery. The north-bound rates on these finished products are, of course, higher than the Official Terri-[fol. 5230] tory level and are shown on Sheets 4 and 5, Section III-B of my Exhibit No. 88. Naturally, readjustments in inter-territorial rates from the South to the North on different classes of traffic are taking place all along, but they represent rates which are, distance considered, higher than are the rates on the same classes of traffic in Official Territory. Whether these rates are in all instances satisfactory to the Southern producers, I am not prepared to say, except I will say that the rates on a good many of the commodities processed in Atlanta, which have actual or potential markets in Official Territory, are not satisfactory. I should like to refer to a few of them.

In making that statement I had in mind submitting to this Commission certain factual evidence as to the manufacture of a selected list of commodities manufactured in the Atlanta area, both high-grade and low-grade and medium-grade, to show that there is a need for competitive rates and to show this need has not been met by the Southern carriers.

These manufactures are designated by the latters A, B, et cetera, on sheet 5 of my Exhibit No. 220.

This exhibit also shows what the actual rates are on these commodities that are manufactured in Atlanta and I want it clearly understood that all of these commodities are sold in Official Territory as well as Southern Territory in competition with similar manufactures located in that territory. [fol. 5231] I merely selected these particular commodities because of their wide range in character.

The exhibit shows clearly what the present rate level is in the South as compared with the North and what the inter-territorial rate level is.

Most of the articles enumerated on this exhibit move on exception to the classification.

Commr. Aitchison: You are speaking of 25?

The Witness: Yes.

Commr. Aitchison: Please point out where the inter-territorial are. I don't get that.

The Witness: You have three columns, Mr. Chairman. The first column is the Southern level and the second column is the Official Territory level, and in the third column is the level from the South to Official.

Commr. Aitchison: Expressed in percentages of what?

The Witness: Next to percentage columns are the levels relating to each other. In other words, taking the first items there, brushes, the Southern level is 90 per cent of the Northern level and that is true as to the inter-territorial rate,——

Commr. Aitchison (interposing): Let's not go into that. Let's take brushes NOIBN south to Official is 70 per cent. 70 per cent of what?

The Witness: 70 per cent of 1st Class.

[fol. 5232] Commr. Aitchison: Applicable from the South to Official?

The Witness: That is true.

Commr. Aitchison: And that would be a combination of——

The Witness (interposing): No, it is not a combination. It is an exception of 3rd Class.

Commr. Aitchison: How would 1st Class be stated from South to Official?

The Witness: It would be stated 138 per cent of the Official Territory level. That is the way these percentages are arrived at, just like I did on my other exhibit.

Commr. Aitchison: K-2?

The Witness: Yes, sir, K-2 vs. Appendix E. That would vary, you understand, at some particular point?

Commr. Aitchison: Certainly.

The Witness: This is merely expressed in a general level.

Commr. Aitchison: From Atlanta?

The Witness: Yes, sir, and we have very few 1st Class rates from Atlanta to CFA Territory and Illinois Freight Association Territory, that are less than K-2 scale, so I think this is a proper measure—that is a proper measure to use in testing the rates from Atlanta.

Commr. Aitchison: How are you able to get at it being 70 per cent and make it 97 per cent when you relate the two together when you have the varying mileages up to the point [fol. 5233] where your K-2 scale begins to apply.

The Witness: I will answer, Mr. Commissioner, I am dealing with the ultimate freight bill that the man pays on these brushes, and his freight bill from Atlanta to Point A, or say Detroit, Michigan, is just 138 per cent higher than it would be if it came from a manufacturing point in Official Territory for the same distance. I mean if you had the full 1st Class. In this instance he is less than the northern man. In other words, he has a rate from Atlanta to Detroit that would be 97 per cent of the Official Territory level.

Commr. Aitchison: That is what got me. I didn't see Detroit in your exhibit.

The Witness: I could take out a specific point and give you an actual rate.

Commr. Aitchison: It would be a different per cent, though, wouldn't it?

The Witness: No, it would probably be about 97 from an equi-distant point in Official Territory to Atlanta. It might be 98 or 96 or 99.

Commr. Aitchison: I had not thought the K-2 scale worked that way.

The Witness: In other words, Mr. Commissioner, in testing the Docket 13494 1st Class rates from Atlanta to Central Territory you find on an average that it is the same as—only a cent or two different than the K-2 scale if it [fol. 5234] applied direct and when we get over to the Washington Terminii three or four or five cents higher than the K-2 scale. I filed the exhibit in Indianapolis and it is included in my Exhibit No. 88 to show you to what extent these 1st Class rates are the same as or higher than the K-2 scale.

Commr. Aitchison: If that is in the record, that is all right.

The Witness: For instance, from Jacksonville, Fla., I think most all of their rates are higher than the K-2 scale if applied originally from origin to destination. Of course that isn't true from Trunk Line Territory.

The only difference between this exhibit and the one I filed at Indianapolis covering a wide range of commodities is as to Trunk Line Territory; I mean, in order to arrive at an approximate level I took 92 per cent of the total so it would be a little lower than this exhibit shows it, but I think this is sufficient for the purpose for which I am using it.

I had in mind—I haven't enough of the catalogues—I wanted to prove beyond doubt that this production is bona fide. I will let you look at them. They are not going to be filed as an exhibit, just to show that we do sell brushes. There is no question about it.

The next item appearing is calendars. We have in Atlanta some very large printers. We try to get some business in Official Territory. We do get some business some [fol. 5235] times and at the present time are doing a great deal of work for the Government, but of course that is not ordinary work, but with respect to the calendar situation we have one printer in Atlanta, and a rather large operation, and he endeavored to get into this business and did secure at one time some business in the North and I think the calendars made in Atlanta are just about as good—Now this Gulf Refining calendar, that business was secured one year and was later lost because of our inability to secure proper rates out of Atlanta, carload—they all move in carload quantities.

The business of the International Agricultural Corporation was also lost for the same reason and you will find the 1940 contract of the Atlantic Coast Line Railroad, one of our main Southern railroads, was given to this concern but he hasn't had it since that date, although he is located on the Georgia Railroad, a child of the ACL, and the ACL today is buying their calendars in Chicago.

When this Gulf Refining Company contract came up on April 9, 1941, I made a very strenuous effort to have the Southern carriers do something about these rates into Official Territory.

I finally reached an agreement with the Southern lines as to certain rates to be published to Boston, New York, Philadelphia, Pittsburgh, Toledo, Louisville, and the proposal was filed under date of July 7, covered by submittal [fols. 5236-5237] No. 26056, suggesting those particular rates which were not entirely satisfactory and were not on a destination level by any means, but nevertheless we felt might permit this manufacturer to continue being favored with this business.

That problem met the usual fate of all inter-territorial problems that come from the little man. It was non-concurred in very promptly by the Official Territorial Lines, and my file is closed. No rates were ever published. Consequently the calendar manufacturer in Atlanta is not in the calendar business any more, although he prints just as good a calendar as our very good friends.

Mr. McCollester: Where did he get his paper?

The Witness: That brings up another question of in-bound raw material. While it is true that some of this so-called white paper can be secured in the South, it so happens that this particular printer gets all of his paper from the East so he pays a rate in-bound on print paper 138 per cent of the Northern level and then pays rates out-bound of what you see here in this exhibit which is also 138 per cent and that is the reason why he is unable to even sell his own people in the South.

The next manufacturer, No. C, manufactures electric appliances.

This manufacturer also endeavors to sell in the North. I will give you the catalogue of this manufacturer.

[fol. 5238] Commr. Aitchison: Are you going to be asking us for coupons pretty soon?

The Witness: No, you can throw them away.

This manufacturer was a party to the Southern Governors Commodity Rate Case, Docket No. 7746, but the Commission held there that he had not made a case under Section 3 by virtue of the fact he could not prove any damage in his effort to ship into the North so it seems that the railroads and the Commission both have thrown us out so far as this particular manufacturer is concerned.

Commr. Aitchison: Is he being damaged?

The Witness: He is having to meet this competition in the North, and to the extent he can secure any business north of the Ohio River it is necessary for him to shrink his profits to that degree, and of course that reaches a saturation point very soon after he reaches the Ohio River.

Commr. Aitchison: If he can make out a case our doors are open.

The Witness: We tried to make out a case in the Governors Commodity Rate Case but the Commission decided against us.

The next item is Manufacturer D, cotton clothing, and I think what I have said about the cotton clothing before will be sufficient, except in this instance I have included clothing NOIBN which would cover other than work clothing.

You can see the difference between the two rate levels on [fol. 5239] one kind of clothing, all of which is manufactured in the South. The clothing other than work clothing: Our level into the North 197 per cent of the northern level illustrates on work clothing it is 138 per cent of the northern level, and that all comes about by this ingenious method of using Index 100 rate to measure your rate levels.

Mr. Grubbs: Did you say all these are class rates?

The Witness: No, sir, they are all exceptions, and if you would desire I will give you the commodities on there on which there are no exceptions, but nothing but the classification basis applies: It would be: B calendars; C electrical appliances; E cloths or rags, wiping, carload; M, tanks, iron or steel; N, wine; and P, lead products.

As to those, the classification basis applies—the classification bases apply today and are involved in this case so far as those particular commodities are concerned, technically.

The next item is machinery wiping rags. That is a manufactured product. It is produced in rather large quantities in Atlanta and at certain other points in Southern Territory and at particular points in Official Territory.

The carload basis within the South and from the South to the North is 180 per cent of the Official Territory level.

We were not very much concerned about the carload rates on these articles until there began a demand under the [fol. 5240] present emergency for the purchase of these rags in carload quantities.

The l.c.l. basis is the same as the rates on textiles, and it took about three years to have this particular adjustment made on these rags in the South and inter-territorially, but in any event they do not apply on carloads. Therefore, our l.c.l. rates into the North are very near the northern level so we haven't complained so much about the l.c.l. rates, but when this carload business came into the offing then we were very much embarrassed.

I have here, Mr. Commissioner, a number of bids of the United States Government which these people have bid on at Sewell's Point, Norfolk, Virgina, and Mechanicsburg, Pennsylvania and Bayonne, New Jersey, and these bids have all gone to the northern manufacturers except that last one, and that comes about by the establishment of a rate from Atlanta to Norfolk at our insistence that would put this man in competition with the northern producing points.

That matter was first handled with the Southern Railway on October 7, 1942. The rates became effective on

March 2, 1943. There was fairly prompt handling of that situation at Norfolk. Of course we agreed there was no hopes of getting the Trunk Lines to concur in rates to Mechanicsburg and Bayonne, and we did not file a proposal to cover those rates.

The Southern Railway, however, was not willing to meet the northern level precisely at Norfolk. They were willing [fol. 5241] of course to establish a rate of 46 cents. That rate represented a rate 5 cents higher than if the Northern or Official Territory basis were applied.

I was forced to accept the rate although I felt that the southern lines should establish the northern level which would have given Atlanta a rate of 41 cents.

After that rate was under consideration, and the assurance that it would be established by the Southern lines, this Atlanta producer was able to secure a contract from the Government covered by Negotiation No. 2698 dated January 15, 1943, distributed by the Navy Department for delivery of 690,000 pounds within a certain period at the Navy Yard at Norfolk, Virginia.

That business was secured by these people on a delivered basis of 10.35 per pound whereas their competitor at Hamilton, Ohio, who had been securing this business heretofore, bid 10.87 so you can see how close those two bids were and what the difference in rates means when you understand that the prior rate from Atlanta to Norfolk was 75 cents and from Hamilton, Ohio, 42 cents. That shows that the competitive situation is controlling in many instances with respect to a commodity of this character.

I don't think it is necessary to read these bids that have been offered but they run into the millions of pounds of these rags, and it is valuable business, but there is no [fol. 5242] chance for the Atlanta manufacturer to secure any of that business.

Commr. Aitchison: Do they normally take class rates?

The Witness: Well, they take class rates today. No, sir, they are usually on a textile basis.

Commr. Smelker: Are those sterilized rags you are talking about?

The Witness: Yes, sir, sterilized or manufactured machinery wiping rags.

Commr. Aitchison: Are the rates from Atlanta higher than the textile rates, you say?

The Witness: Yes, sir. The next item is toys. I am referring particularly to a definite type of doll that is manufactured in Atlanta. I think the Atlanta production is about the second largest in the United States of this particular type of doll.

These people have quite large factories and they have continually complained about their in-bound raw material rates vs. those located in the Metropolitan District for instance in New York, and their rates out-bound.

Sheet 5 shows the disadvantage of this manufacturer with those located in Official Territory.

Commr. Aitchison: Going back to these rags, you say they are sterilized?

The Witness: They are prepared rags. They are not run-of-the-street rags. They are sterilized and are a prepared [fol. 5243] rag.

Commr. Aitchison: How are they packed?

The Witness: They are packed in cartons. They go to the Navy.

Commr. Aitchison: Any particular dissimilarity in the packing from textiles?

The Witness: No, sir.

Commr. Aitchison: Because they are sterilized do they have any greater value?

The Witness: No, they are not as valuable as textiles. It so happens that they are not on the textile basis, carload. We have had no carload movement to speak of, and that is something the Southern carriers haven't had before them.

Mr. Smelker: Some States require they should be sterilized.

The Witness: Oh, yes. If you take the run-of-the-street rags, which are reconditioned by these reconditioning plants, they all have to be sterilized before they can be shipped out again.

The next item is garment hangers, pulpboard.

After the iron and steel situation became acute, incident to the war, there was a widespread demand for these pulpboard garment hangers. We have some quite large paper converters in the Atlanta area, that is converting paper into specialties, and in fact one of these converters has the [fol. 5244] patent, so he claims, on one of these garment hangers, but as everyone knows, an article of this kind is very cheap and in endeavoring to supply certain demands for these hangers, particularly in Official Territory, the question of rates became a very live question, and that matter had been before the Southern carriers for quite some time, in fact since September 1942, and there has been no agreement reached as yet with respect to the rates on these articles between Southern and Official Territories.

The exhibit shows what those rates are today, and here again you will find that they are rated the same percentage of 1st Class in the two territories, and inter-territorially and that gives us that automatic 138 per cent difference.

This board that is used, of course our rates in-bound on the raw material are on the northern level so we have no complaint about our in-bound raw material rates.

In other words, if our out-bound rates on these articles had been the same to begin with as the northern manufacturer we would have had no trouble in securing certain business that was offered.

Our next item is flavoring syrup.

Chmn. Alldredge: Would that include Coca-Cola Syrup?

The Witness: Coca-Cola Syrup, yes, sir. In addition to the manufacture of Coca-Cola Syrup in Atlanta we have two other quite large productions. One is the Nu-Grape Syrup. [fol. 5245] The Nu-Grape Company of America produces all of its syrup at Atlanta whereas the Coca-Cola Company does not.

We have one other large production of chocolate syrup, this so-called fountain chocolate syrup that is used for your malted milk, and that has a national distribution so it can be said with assurance that Atlanta is vitally interested in the rates on flavoring syrup.

To most destinations in Official Territory the rates on flavoring syrup from Atlanta are constructed on a combination basis. I haven't undertaken to show what the combination produces and I have only undertaken to indicate the level in the South and the level in Official Territory. Those two levels are the same.

The Column 37 in the South and Column 52 in Official Territory represents identical levels, but now when our people go to ship into the North they meet a different condition.

They are required to pay a level of 147 per cent of the northern level which is even higher than the 1st Class relationship; they just would not be able to market their goods, particularly this chocolate syrup on any such difference.

For instance, the chocolate syrup manufacturers draw their raw material from the same source of supply that the northern manufacturers do, that is generally speaking, Hershey, Pennsylvania, and Fulton, New York, and Brooklyn, New York.

The rating is Official Territory on chocolate coating, [fol. 5246] 29 per cent of 1st Class, whereas we pay 35 per cent of 1st Class in order to get our chocolate coating from these northern manufacturing points.

Commr. Aitchison: I wish you would tell me how you figure that 147 per cent.

The Witness: That is the relationship of 55 to 52; 55 of K-2 to 52 of Appendix E. In other words, to get 138 you would have 55 in the Official Column and 55 in the South of Official but you have 52 in the Official and 55 from the South of Official and that produces 147 per cent. In other words, our rate level on the in-bound material is even higher than our out-bound difference on the finished product.

I think that is perfectly apparent that a Southern manufacturer is not going to be able to prosper very much under any such adjustment.

Mr. McCollester: Coca-Cola?

The Witness: I wasn't referring to Coca-Cola, Mr. McCollester. Coca-Cola has plants in every territory. These other plants do not have but one plant.

I might state right there though that this remark incidentally of the far-sightedness on the part of the Railroad Classification Committees, and I think Mr. Fyfe's statement about the rates on flavoring syrup is about as fair an illustration of the railroad's policy as to classification matters as could be exhibited.

[fol. 5247] He took occasion to criticize the traffic officials of the railroads for departing from the Commission's basis on flavoring syrup. He entirely ignores the fact that these levels in the South and in the West, which is 42 per cent of 1st Class, and in the North are absolutely necessary to get any of this traffic and still some of it moves by truck.

If you had a level any higher than that the railroads wouldn't haul any of it, though Mr. Fyfe contends that it is ridiculous to reduce the rates to these levels. That shows the attitude of the Classification Committees of these rail carriers.

Mr. McCollester: Mr. Chairman, of course I appreciate that the Commission cannot always follow the strict order of going forward with proof, but I submit that this line of testimony which the witness is now giving, and Sheet 5 of his exhibit, cannot by any stretch of the imagination be considered rebuttal.

It seems to me that this is part of a new case in chief establishing, or trying to establish I should say, some claim with respect to these rates.

We have several shippers of these commodities in our territory. We may want to have something to say about this showing here, whatever it may be. It seems to me that this is no time, at the very end of the case, to come forward with this on the ground it is trying to rebut something.

[fol. 5248] Mr. Grubbs: I would like to join, if your Honor please, in the objection that has been made by Mr. McCollester, and to say further that this exhibit was not distributed as other exhibits have been, in advance of this hearing, but was given us only this morning.

This whole part of Mr. Hart's evidence comes completely in the nature of a surprise to us, and we are not prepared, as we desire to be prepared, to meet evidence of this kind or any kind with which we may be faced.

Commr. Aitchison: Of course so far as the rates are concerned they would be subject to check.

Mr. Grubbs: Of course that is true.

Commr. Aitchison: That simply leaves then, doesn't it, the question as to whether Mr. Hart is reasonably accurate in stating the commercial conditions of the manufacturers and so on, at Atlanta. Haven't you your own people here, of the Southern Railway, that can answer that question?

Mr. Grubbs: The answer may be a little bit more than a challenge to Mr. Hart's knowledge of the economic conditions.

The Witness: I represent these people. I know what their problems are.

Mr. Grubbs: Your Honor will recall that in the case of other shipper witnesses we have undertaken to present through rate exhibits a showing for example of this nature that the competitive conditions complained of would [fol. 5249] not be bettered but would be worsened by a leveling process, that is to say, by a uniform adoption of the class rates, and it might be that we would wish to submit evidence of that nature, I don't know, but this comes on us as a surprise. That is the point on that which I wish to make.

Mr. Norman: In the first place, if the Commission please, I hadn't understood that any of these parties have been confined to rebuttal testimony at this hearing but we have tried for the most part to make ours exclusively rebuttal.

As to these particular rates here, so far as the rates are concerned, of course as the Chairman has pointed out they are subject to check.

So far as this testimony about the effect on these industries is concerned, of this rate adjustment, I don't know how anybody could rebut that.

Commr. Aitchison: I think it is probably proper rebuttal of testimony to the effect that it was testified to by Mr. Widell and others that the South wasn't interested, if its true interest was considered.

Mr. Norman: It is just showing illustrations of where they are.

The Witness: And further, I intended it to be a rebuttal of——

Commr. Aitchison: (Interposing) Well, now, I have ruled in your favor. If you want to argue it, I may change it.

[fol. 5250] The Witness: All right. I didn't know you had ruled on it.

Shipper designated J is a manufacturer of automobile engine belts, hose, and vulcanizing patches.

Commr. Aitchison: I will have to ask you to be as brief as you can on this.

The Witness: This manufacturer distributes in the South and also in the Southwest, and endeavors to get into Official Territory. He has never been able to secure any rates so far as Official Territory is concerned.

He draws his raw material, which is comprised principally of crude rubber, from the pool in New York, under normal conditions. He doesn't get any today, but under normal conditions it comes from the New York pool.

The rate on crude rubber into Atlanta from New York is on the northern level. So far as his in-bound raw material is concerned, he is on an equality.

Shipper K is a manufacturer of school blanks and forms, pads, tablets, and so forth, a very large manufacturer.

His tonnage probably will run in the neighborhood of 7,500 pounds per annum.

This shipper complained in the Southern Governors Case and was there accorded relief as to one part of his production but as to the other part the Commission held he had not made a case because he hadn't shipped into [fol. 5251] Official Territory, but it is absolutely impossible on goods of this character for an Atlanta manufacturer to overcome the disadvantage in transportation costs which are wholly controlled by the cost of moving these goods from Atlanta to Official Territory in competition with northern manufacturers.

You will observe in some instances here the rates from the South to the North are 175 per cent of the northern level. This manufacturer, although a large manufacturer and compares with those located in the Miami Valley and elsewhere, is unable to secure any business north of the Ohio River.

To the Ohio River and in the South the level of rates on these articles is identical with that obtaining in Official Territory. The levels are identical in the two territories whereas inter-territorially we are confronted with this rate wall.

Mr. McCollester: Mr. Commissioner, this is a very good example of the prejudice we are suffering of having what is now Complainant's case come in at this stage, because in the Southern Governors Case we dealt with this particular article. We produced evidence as to the situation in Official Territory and on the basis of that evidence you dismissed the man's complaint. Now we have no chance to produce that evidence.

Mr. Norman: What evidence?

Mr. McCollester: I know in the Southern Governors Case they said it was perfectly all right, that he had no [fol. 5252] ground of complaint and they dismissed him on it.

Commr. Aitchison: He hasn't shown any changed circumstances, has he?

The Witness: All I intend to show by this is the Southern carriers have not been able to put this particular manufacturer into Official Territory because the Official Territory Lines will not concur in rates from the South, and that is the reason I am rebutting this evidence by the railroads that there is nobody complaining, that whenever they want rates they could get them, and he can't.

Mr. McCollester: In the Southern Governors Case the showing was that he had nothing to do with it.

The Witness: Well, the Governors Case will speak for itself without you testifying about it, but I say he wants to go into Official Territory and if he had the rates he could go in there.

Mr. McCollester: Why didn't he come in and testify at the first hearing?

The Witness: Because his rates are not involved in this case at all.

I am answering Mr. Oliver when he said nobody had complained about it. I am showing you we do have complaint. This is rebuttal of what Mr. Oliver stated that nobody in the South complained; that when they needed rates they came to you and you gave them to them, and [fol. 5253] I am showing that isn't true, and I have selected this particular group of commodities—that is not all of them by any means; the Southern Railway in some instances has been willing to put rates in but the Official carriers will not concur in them, and I say we are still paying these higher rates.

Mr. McCollester: Then are we to understand some of these rates are not involved?

The Witness: Yes, they are, and I gave the exceptions.

Commr. Aitchison: He gave the exceptions. He called attention to B, C, E, M, N, and P.

The Witness: But I am here rebutting what the Southern carriers tell this Commission.

Commr. Aitchison: Go on.

Mr. McCollester; Before you leave that, where does the particular manufacturer get his paper?

The Witness: This manufacturer uses both newsprint and other white paper. Some of it is produced in the Southern mills; some of it in the Northern mills and of course the news print comes either from the North or from the Coast.

Commr. Aitchison: We have had, of course, testimony with respect to wine by the wine manufacturer, haven't we?

The Witness: Yes, but I wanted here to point out, which was not pointed out there, just where we have been getting with rates on wine. I am perfectly willing for the exhibit to speak for itself except to say that as to L, M. [fol. 5254] and P,—Well, I want to say something about P, just say L and M, the conditions are the same there as to the other manufacturers.

As to wine I think that has been pretty well covered in this record except that I wanted this Commission to know how long we have been trying to get these rates into Official Territory.

Disregarding the preliminary handling that I have given this matter in the beginning, wherein I was unable to get a Southern carrier to even file a proposal suggesting the rates on wine, I was finally told by one of the Southern lines that perhaps I might interest the Southern Freight Association in getting out a proposal that would be distributed and therefore give the lines an opportunity to consider it.

Following that suggestion on May 20, 1937, five years ago, I wrote Mr. Kerr, Chairman of the Southern Freight Association, at length, to be exact, four pages single-spaced; setting out the situation with respect to the wine industry in Georgia and particularly in Atlanta and what their needs were, and I was informed by Mr. Kerr that if I would draw up the proposals myself that he would be kind enough to distribute them.

I did. I took the form and drew up these proposals myself, took them over to Mr. Kerr's office, and they were reproduced under Submittal Nos. 14717, 14718, Pacific Coast; 14719 Official Territory; 14720 Western [fol. 5255] Trunk Line and 14721 to the Southwest, embodying the rates which I felt these wine people would need in order to further this new industry.

Those submittals were attached to a letter addressed to me dated June 2, 1937.

The matter of wine rates since that date has been one of continuous consideration, and that remains in that same status today. None of these proposals were approved. They were all disapproved.

Commr. Aitchison: The proposals were for a commodity rate?

The Witness: Yes, sir. I submitted a complete proposal to every section of the United States with actual rates. They were distributed and nothing has ever been done about it.

We did get some rates into the Southwest by virtue of the action of the Southwestern Lines in establishing rates from Denver, Colorado, and we were finally able to persuade the Southwestern Lines that they should treat Atlanta as well as Denver, and were able to secure some relief into the Southwest, but there was no effort on the part of the Southern Lines that brought that about.

Just recently we were able to persuade the Southern Lines that they should establish rates to the Ohio River, and that has been done, but as to Official Territory, after the Columbus hearing Mr. Oliver instructed Chairman Kerr to initiate a proposal suggesting rates on wine on lines from the [fol. 5256] South to Official Territory, and that remains today just where all the rest of them are, non-concurred in by the Official Territory Lines, and I would venture the prediction that it will stay there, so we are still without rates.

Commr. Aitchison: You are without commodity rates?

The Witness: Yes, sir.

Mr. Norman: Or without rates on the basis of the rates in Official Territory?

The Witness: That is right. That is correct.

The only reason that we have a level that is so near the Northern level, that is 27 per cent higher, rather than something less higher on wine in containers is by virtue of the reduced rates which these railroads put in on alcoholic liquors. They felt like they couldn't refuse the wine people rates no higher than those on hard liquor, so they included the wine rates along with those liquors, and by that means we got a reduction in the classification basis so far as wine in packages is concerned, but as to tank cars of course we got no relief.

Commr. Aitchison: I don't understand. You told me that was involved in this case.

The Witness: It is on tank cars because it is a classification basis.

Commr. Aitchison: But not on containers?

The Witness: No, sir. Probably I should have modified [fol. 5257] that.

I did want to mention these lead products for a minute.

We have quite a large converter of lead in Atlanta that we are trying to build up.

We were able to secure adjustment in the in-bound raw material rates on pig from the Western smelting points.

For instance, using Anaconda, Montana, as a basis point in the producing area of the West the rates to Atlanta (this is without the 148 increase) is $13.75 per net ton; Baltimore $13.09; to New York $13.75 and to St. Louis $9.90.

I am naming those points because they are highly competitive with the Atlanta fabricator.

You will find that with the exception of Baltimore and St. Louis that he is fairly related to his competition as to raw material.

We were able to secure rates from Atlanta to the Ohio River and Virginia cities on the Northern level, but we haven't been able to go any further.

Commr. Aitchison: How is that affected then so far as being within the scope of this investigation, if you have been able to get rates?

The Witness: Inter-territorially it is affected by virtue of the fact we have to pay 7th Class inter-territorially and that is 138 per cent of the Northern level, which is also classification basis of 35 per cent.

[fol. 5258] Commr. Aitchison: It is only inter-territorial?

The Witness: That is right. It is the same thing in the South.

Commr. Aitchison: I thought you said you had an exception.

The Witness: Oh, yes, we have an exception in the South, but the point here is these Southern railroads, although willing to put in competitive rates, were unable to go any further than the Ohio River. The Northern carriers won't go along with us.

Commr. Aitchison: Does that conclude that?

The Witness: That concludes that part of it.

Commr. Aitchison: Do you offer in evidence Exhibit No. 220?

Mr. Norman: Yes.

Commr. Aitchison: Without objection it is received.

(Exhibit 220, Witness Hart, received in evidence.)

The Witness: (Continuing) Both Messrs. Oliver and Tilford refer to the large movement of traffic on class rates from Official Territory to the South (Oliver, pp. 3838 and 3839) (Tilford p. 3897); but neither of these gentlemen disclosed the true fact that a large proportion of this miscellaneous south-bound high class traffic, on which they state the present high class rates are applied, moves in freight forwarder service, on which low carload all commodity rates [fol. 5259] are provided, or to what extent this traffic that formerly moved generally into the South via the rail carriers on the Classification basis has been diverted to the forwarders and now moves on carload rates, or what proportion of this tonnage is favored with rates little different from the Official Territory level because of the reductions made effective September 1, 1940.

This naturally has a direct bearing on the claim of witnesses for the Southern carriers concerning the revenue effect of changing the inter-territorial rate structure, particularly as it might affect this south-bound high grade class traffic. That the change in the flow of this class rate traffic is material cannot be denied. For instance, three of the principal rail lines serving Atlanta and the direct Southeast terminated in round numbers 9,000 cars of forwarder freight in the year 1941. With respect to Atlanta—the largest receiving plant of forwarder freight—it does not take into account the very large tonnage of forwarder freight handled by one of the larger forwarding companies via contract motor carriers.

A new condition that very much concerned our people is the probable effect on the Southern industrial situation because of the concentration of defense contract awards in the East and Central States, which has caused large expansion in plant facilities in those sections to meet these demands. This industrial concentration has significance in [fol. 5260] regard to the well-being of the entire United States, in addition to the immediate economic significance of having one region of the country largely a work shop and the other regions raw material and semi-finished goods producers. That this condition may have a far reaching effect on the South's economy cannot be disputed.

Many of those connected with defense production tell me they are aware of the condition. Before a Committee of Congress, Donald M. Nelson, at that time Director of the Division of Purchases of the Office of Production Management, stated that "the distribution of Army and Navy orders has tended to follow rather than to deviate from the previously existing pattern of industrial activity".

Therefore, I desire to place before the Commission, in a few words and without an array of figures, a realistic conception of the South's economy. The economy of any country—or its sub-divisions—and transportation in all of its phases are inseparable. I have endeavored to present a realistic picture of the present conditions with respect to the class rate structure applied in the territory east of the Mississippi River.

The South is entering a cycle which is the reverse of the one of 150 years ago, which might well be referred to as the "cotton economy", as compared with present "industrial economy". The economic laws which control the destiny of [fol. 5261] millions of persons living on cotton farms in the South were not written in the legislative halls of our country but in the work shops of England. It was the invention and use of cotton textile machines which established in England the factory system of manufacturing that is now universal throughout the world. And it was the inauguration of the factory system which led to the demand for raw cotton as a source of cheap fabrics.

To supply England's demand for raw cotton, the people in the Southern portion of the United States abandoned one economy of living and established another. The South's dominant position of leadership in American industry—developed as it was through many small units—had no appeal compared with the romantic possibilities of farming on a vast and magnificent scale.

It has been said that the invention of the cotton gin by Ely Whitney in 1793 changed the South's destiny from that of industry to that of agriculture. Factories and shops were closed; and the people of the South—just as those in every other colony in the British Empire—devoted themselves to the task of producing raw materials to keep the wheels of England's industries moving.

It is an interesting fact, looking back on the history of 150 years, to realize that we in the Southern part of the United States established a hand-labor economy to support [fol. 5262] and make possible the first large scale machine-labor economy in the world. And it is interesting and significant to realize that our forefathers in the South established a hand-labor economy in the New World at the very time when such an economy was being abandoned by the British Empire for its citizens living in England.

The effects of the loss of foreign outlet for American cotton and its domestic displacement by other fibres are known to every person who lives in the South, even though definite details may be lacking.

There are those who censure the Federal Government for following a short-sighted and unwise policy; but, be that as it may, the fact remains that a market once lost is never fully regained, and, as a result, it becomes necessary for us to accept conditions as they exist and return to the economy of our first choice—industry.

We, today, do not censure our forefathers who 150 years ago abandoned the safe and sane economy which we are attempting to re-establish. By recalling the facts that led to the development of the "cotton economy", under which we have lived, we hope to hasten re-adjustment by pointing out the fact that the circumstances which brought such an economy into existence no longer prevail. We merely wish to act as intelligently as our ancestors, who were quick to see and meet the market demand. It is gratifying to [fol. 5263] know that the rapid change in the South's economy will not be confined to the conception of some of those who have discussed it here.

We do not deny that the rate-making policy of the railroads operating in Official and Southern Territories has been different, or that originally the rate structures were developed along different lines and that the distribution of the traffic burden and the composition of the traffic have been different in the two sections. But these conditions are fast changing along with the South's economy. It has been testified by many here that the South is going forward in leaps and bounds industrially. Conversely, any informed person knows that the composition of the traffic in the South has changed and the distribution of the traffic burden is entirely different, from what it was 20 years ago.

However, the mechanics of rate making by the rail carriers, as well as the motor carriers, in the different geographical sections of the country, have become almost identical. This has been brought about primarily by changes in the law and the organization of rate associations in the different rate territories. They disagree as to level (color), but not as to pattern. This is a realistic condition—there is nothing theoretical about it.

There appears to me to be little disagreement between most of the Southern shippers and the Northern shippers—except, possibly, those located in the State of New York—[fol. 5264] nor between us and the Official Territory carriers concerning an equaligestion of the class rates in these two geographical sections.

I do not understand, for instance, that it is the position of most of the Northern shippers that a mill located at Indianapolis, Ind., and one at Atlanta, Ga., should not compete on an equal basis so far as transportation cost is concerned, either in the South or in the North. Most public officials are of like mind. Certainly, this is true of the Southern public servants.

With The possible exception of the Eastern shippers, apparently the principal apprehension of those opposed to the suggestion that perhaps the time has arrived for the unification of class rates and classification, at least in the eastern section of the United States, originates primarily with the Southern rail carriers, because of the fear that it might adversely affect them financially.

Of course, this premise disregards the rapid change that is taking place with respect to the composition and flow of traffic handled by the Southern railroads. The source of new revenue, so far as the Southern railroads are concerned, is being rapidly increased. Therefore, past experiences are not indicative of revenue consequences that might conceivably flow from a re-adjustment in the present class rate structure in the South.

But the revenue alone is not a sufficient argument to [fol. 5265] support the present theoretical differences in the class rates—particularly the 1st Class 100 rate in the several geographical sections of the country. The revenue needs of the involved carriers can well be determined under the law, and it accordingly empowers the Commission to properly distribute it.

This Commission's legislative powers should be invoked to create a class rate structure responsive to the demands of this country's commerce which will be as simple as it can be made, and free from undue prejudice.

I believe that these observations might well be given consideration by the Commission in legislating the future class rate structure which we of the South are suggesting.

I prepared Sheet 4 of my Exhibit No. 220 to show the reverse of the situation which Mr. Rive has exhibited in his new Exhibit No. 200 with respect to machinery originating in the South and shipped into Official Territory as compared with his exhibit in the reverse direction.

The purpose is to show that the Southern manufacturer, which is right considerable at the present time, on machinery, that he would be better off in the swap.

As I gather it from Mr. Rive's exhibit he wanted to show (Why I am unable to say) that the spread against the Southern shipper would be narrowed by establishing the Official Territory level on machinery.

I just took the same premise on Sheet 4 and I show how [fol. 5266] well off he would be when he shipped into the North under the same basis, and in the trade he would probably be better off all the way around.

Mr. Rive, how[illegible]troduced a further exhibit on the machinery, No. 201, so I think my Sheet 4 of Exhibit No. 220 is a fair answer to Mr. Rive's showing south-bound.

Mr. Wolford yesterday introduced Exhibits Nos. 210 and 211; Exhibit No. 210 covering the rate on glass bottles, and followed the same plan that Mr. Rive followed in his exhibits Nos. 200 and 201.

Exhibit No. 211 is a similar exhibit on furniture.

Of course these exhibits merely show the narrowing of the south-bound difference between a Northern manufacturer for instance of furniture as compared with a Southern manufacturer.

Of course I can speak with assurance so far as the Atlanta manufacturers are concerned, and of course there are no mattresses produced at *the* Birmingham, and it is merely a paper showing as to Birmingham, but so far as the Atlanta manufacturers are concerned they have no objection whatsoever to the Northern manufacturers of mattresses or metal furniture or wood furniture coming into Southern territory on the same level that they go into Official Territory on, whatever that level might be.

I submitted a statement, which I haven't reproduced here, [fol. 5267] in answer to a similar contention made by one of the parties in this case about the narrowing of the spread, so I selected Birmingham and St. Louis into 20 points in Official Territory that were equi-distant from St. Louis as the Southern points which were shown from Birmingham, and then applied the Official Territory level from Birmingham vs. the competition as to St. Louis, and that study shows that the Southern manufacturer's average price difference in these 20 points was $1.11½ per 100 pounds, whereas if the Northern level were applied from Birmingham his difference would be reduced to practically 58 cents per 100 pounds.

If you will check that comparison with this south-bound comparison you will find that the Southern producer, if a common level of rates were applied on these mattresses or furniture, that the Southern producer in the aggregate would be much better off providing he marketed his goods in Official Territory, which he wants to do and does do so far as mattresses are concerned, and many other grades of furniture.

So I don't know what the purpose of these exhibits is, but those are the facts.

I did want to just briefly in passing refer to the 6th paragraph of the statement submitted on behalf of the Governor of New York, and call attention to the figure of 35 per cent mentioned in that paragraph, and refer the Commission to Section III-B of my Exhibit No. 88 wherein I [fol. 5268] have shown the level of rates on many classes of commodities between the South and the North which are less than 35 per cent and some of them greatly exceed 35 per cent, and I just don't understand a statement of this character being made by informed persons.

In connection with the statement submitted on behalf of the Indiana Governor, the question from the Bench was directed to some one, I think Mr. Hollopeter, about the rates on stoves and stone in view of the contention that the Indiana limestone industry was in a deplorable condition, which I think is correct, but it is not, of course, due to freight rates.

In any event the rates on limestone were fixed by this Commission in the Consolidated Stone Case, and they were made a percentage of the 1st Class rates and they were higher than the Northern rates, but prior to that time they were much lower than the Northern rates.

What this Commission did with respect to the stone rates was to take the Indiana limestone rates, which were the highest rates in the United States and bring up the rates from all the other producing areas to that limestone basis.

That was very unsatisfactory to the Southern producers of limestone, granite, and marble, and we made every effort possible to have that corrected, and the Southern carriers did correct it to the extent they could, but not into Official Territory.

[fol. 5269] Then we included stone in the Governors Case, and there were accorded a parity of rates, and those rates today, while not stated as a percentage of 1st Class, they do represent a percentage of the Appendix E Scale, although stated as a commodity rate in a tariff.

That same situation obtains with respect to stoves. I thought possibly you would like to have that explanation of what transpired with respect to the rates on stone and stoves.

Stoves were also prescribed on a higher basis into the North and were later included in the Southern Governors Commodity Rate Case, and there we secured a parity of rates and they are today published as commodity rates by representing a definite percentage of the Appendix E Scale.

At the Columbus hearing you asked some one who was testifying as to whether or not these rates which were established from the South under the Commission's decision in the Governors Commodity Rate Case applied via rail and water routes. They do not. Those rates are confined entirely to the all-rail routes.

There is just one other matter. Getting back to this controversial question that the proper designation of these so-called percentage or column rates, while I have stated in my testimony that it doesn't make much difference what we call them if somebody will name them and they will just continue to call them that; I think the record should [fol. 5270] show that of the commodities listed in Appendix 2 of the Commission's Order of September 25, 1940, which was referred to in Dr. Aitchison's testimony, that certain of those commodities move on rates that are definitely related to the governing 1st Class rate, and so far as the practical rate men are concerned, certainly I have always considered these percentage rates within the scope of the class rate structure, but as I have previously stated, I don't care much what you call them, but I didn't want to leave the impression that these rates are commodity rates as we have always known commodity rates, that is, rates made without any relation whatsoever to the 1st Class rates.

For the record I would like to say these particular commodities under normal conditions move on percentages of 1st Class rate; that is, hay, straw, cottonseed, cottonseed meal and cake, vegetable oil, cake and meal, and certain products of agriculture; asphalt, salt, lubricating oils, and greases and plaster in so far as the South is concerned.

Of course, in the North that moves on what we know as a commodity rate because it is a commodity scale unrelated to the 1st Class, but in the South it appears in the exception and is a part of the class rate structure.

As to those commodities that do not move on what we have always considered strictly commodity rates: I am under the impression Dr. Aitchison included in her exhibit the consolidation of these accounts for statistical purposes; [fol. 5271] for instance, the finished stone was included with the crushed stone group.

There we have in the South a commodity that moves on a column basis or percentage of 1st Class consolidated with a crushed stone which moves on a commodity mileage scale unrelated to 1st Class.

I don't know that it is important. I merely wanted to try some way to get something tangible in this record that would permit the Commission to differentiate between a class rate, or what we think is a class rate, and a commodity rate.

On page 1732 of the record the following question was asked me as the Indianapolis hearing:

> "Q. What would the result be?
>
> "A. I have in my own mind pretty well concluded that it would hurt the Southern carriers."

My answer actually was, "I have in my own mind pretty well concluded that it would not hurt the Southern carriers," and underscore the word "not".

That is all.

By Mr. Norman:

Q. Mr. Hart, I wish you would state very briefly the reasons as you understand them why after the statement by Chairman Aitchison in the Class Rate Case the South did not adopt the suggestion and take up the matter of having those inter-territorial rates dealt with.

A. To be perfectly frank about it we were rather dis- [fol. 5272] appointed at the inter-territorial rates which the Commission finally approved in the Southern Class Rate Investigation.

They were changed, as you know, a number of times, and they finally reached the peak of the carriers' proposals in most instances.

We began immediately (I am talking about the shippers now, and so far as my own organization is concerned and some of the other large shipper groups in the South) began immediately to consider ways and means by which that might be reconsidered by the Commission.

It was concluded to await the final outcome of the Eastern Class Rate Investigation and probably until it was put into effect, which was on December 31, 1931, as I recall it —I think that is correct.

Thereafter it was considered again, and at that time everyone knows we were straddled with a very serious depression; things were in rather bad shape with the shippers; railroads were in bad financial condition and were here before this Commission seeking increases in rates.

Commr. Aitchison: I think there was a five months' gap in there.

The Witness: Well, we were talking about it right after the order came out and we didn't like it and we didn't do anything immediately about it because we thought we would wait a little while and see.

[fol. 5273] There were further discussions as to whether or not it would be proper perhaps to ask the Commission to reopen the Southern Class Rate Investigation, or file a new case, and there was a lot of argument between us technical men—every week, put it that way—as to what would be the proper course to pursue, and some thought that perhaps the reopening of the Southern Class Rate Case would be proper and others thought that that record was dead, and we didn't want to reopen that record; it was not a record that we liked very much, so the final conclusion was to file a new case, and that case was filed just as soon as it could be got in shape.

Time passes by, and there was no way by which we might have taken quicker action, as I see it, under the then existing conditions.

But I can say positively for my interests, and as I have told you I was a very active participant in Docket No. 13494, and so far as our interest is concerned we were very much disappointed with the Commission's decision in that case and we were insistent that the other Southern interests join us as soon as possible in trying to have it corrected.

There were many things in it that were not satisfactory, not only levels of rates but these other things we have been complaining about.

Commr. Aitchison: What are they?

The Witness: Particularly one of the principal ones [fol. 5274] was this prescription of these lower relative rates into this Border Territory than in to the Deep South.

That was one, and Mr. Eastman recognized that and he recognized the validity of that and said to these Southern carriers, "You can cure that by putting in commodity rates from Atlanta."

We have that same thing coming up today. You have just decided a case brought by these Northern Georgia interests on iron and steel from Pittsburgh and Bethlehem, and there you have prescribed rates and made 30 per cent of the Border cases 1st Class rate.

The only way that the Atlanta steel interests or the Birmingham steel interests can meet that competition is for the Southern railroads to put in commodity rates to meet it; otherwise they are not going to get the business.

Commr. Aitchison: That hasn't anything to do with this question as to why.

The Witness: I say that was one of our complaints because that has been coming up all the time, and that was one of the principal complaints we had, in addition to the measure of the rates. The measure of the rates was not satisfactory, and we did consider it.

Commr. Aitchison: Is that all, Mr. Norman?

Mr. Norman: That is all.

Commr. Aitchison: You may stand aside for the time [fol. 5275] being, and w[illegible]ill take up your cross examination tomorrow morning.

(Witness temporarily withdrawn)

W. M. Dyer, previously sworn, was called as a witness and testified as follows:

Direct examination:

Commr. Aitchison: You have been sworn?

The Witness: Yes, sir. I testified at the Columbus hearing on behalf of the Wichita Chamber of Commerce, and Mr. Hamilton, in his Exhibit No. 18 seeks to continue the WTL zones which we attempt by our evidence, or rather myself and others, attempt to break down.

I desire to put in some railroad mileage figures for the Counties of Marion, Sedgwick, Harley and Butler County, Kansas.

The total railroad mileage for those four counties, including the mileage to the next more distant tariff named point in the next county is 663.2 miles.

The actual railroad mileage for those counties, using an estimation based on Rand McNalley Atlas 1938 is 614 miles. The author for the railroad mileage is L. E. Kipp, ICC A-2678.

Commr. Aitchison: Cross examine.

(No response)

Commr. Aitchison: That is all.

(Witness excused.)

[fol. 5276] Commr. Aitchison: We will suspend until 9:30 o'clock in the morning.

(Whereupon, at 4:55 the hearing adjourned until 9:30 o'clock a. m. tomorrow.)

[fol. 5277] BEFORE THE INTERSTATE COMMERCE COMMISSION

Docket No. 28300

Class Rate Investigation

Docket No. 28310

Consolidated Freight Classification

Main Hearing Room,
Interstate Commerce Commission Building,
Washington, D. C.,
Thursday, April 1, 1943.

Met, pursuant to adjournment, at 9:30 o'clock a. m.

Before Division 2 of the Commission

Hon. Clyde B. Aitchison (Presiding), Hon. J. Haden Alldredge (Chairman of the Commission), Hon. Walter M. Splawn and a Cooperating Committee of the National Association of Railway and Utilities Commissioners, represented by: Mr. W. H. Scott, of The Public Service Commission of South Carolina; Mr. George McConnaughey, Public Utilities Commission of Ohio; Mr. C. L. Doherty, South Dakota Public Utilities Commission.

Present: Paul O. Carter, Examiner; W. J. Koebel, Ex- [fols. 5278-5279] aminer; T. L. Haden, Examiner. W. V. Hardie, Director, Bureau of Traffic. J. J. Murphy, Consultant.

Appearances: (As heretofore noted.)

[fol. 5280] Proceedings

Commr. Aitchison: Mr. Turney.

Mr. Turney: If the Commission please, I should like to stipulate into the record by reference the following statistical documents. These are all for the year 1940 and subsequent years are applicable.

Preliminary Abstract of Statistics of Railways.

The Statistics of Railways (that is the Blue Book).

The Freight Commodity Statistics—Annual Q-500.

Freight Commodity Statistics Quarterly Q-550, M-100, M-125, M-211, M-215, M-220, and A. A. R. C. S. 554-A.

Commr. Aitchison: Is that stipulation agreeable?

Mr. Wagner: If the Commission please, if I am not mistaken the Blue Book for 1939 is not in this record. I think Mr. Turney is starting with 1940.

Mr. Turney: I understood 1939 was.

Mr. Wagner: I do not recall its coming in.

Mr. Turney: I shall ask that it be put in.

Commr. Aitchison: Did you want to go back to 1939 then?

Mr. Turney: No, just for the Blue Book.

Mr. Wagner: In other words, the foundation of many of these studies is 1939 figures.

Commr. Aitchison: Is there any objection on anybody's part to receiving and considering in evidence these statistical compilations which Mr. Turney has referred to?

[fol. 5281] There seems to be none and they will be received.

(Statistical documents listed by Mr. Turney received in evidence by reference.)

Commr. Aitchison: Mr. Hart, are you available for cross-examination?

Mr. Hart: Yes, sir, I am ready.

E. L. Hart resumed the stand and testified further as follows:

Cross-examination.

By Mr. Clark:

Q. Mr. Hart, let me run through your statements just a moment.

I am not clear just exactly as to what parts are in and what parts are out. If I ask you about something that is out, you can correct me. Have you got the statement in front of you?

A. Yes, sir.

Q. Please look at page 9.

A. Yes, sir.

Q. Toward the bottom of the page you say "Certainly no water line has appeared here," talking about the control of the rates. Do you see that?

A. Well, it is changed to read this way now—of course the sense of it is the same—"Certainly no water line continues to control the rates from the interior east," and that is my statement.

[fol. 5282] Q. In that connection of course you recognize the water lines are now out of business; they are not functioning.

A. Of course I understand that.

Commr. Aitchison: They have got tariffs on file with us, haven't they?

The Witness: The physical operation of the water lines has been discontinued, yes.

By Mr. Clark:

Q. That is what I am talking about.

A. I want to follow that——

Q. (Interposing) Turn over please to page——

A. (Interposing) I want to follow that if you will let me answer.

Q. I asked a simple question and I got the answer. If you want to make a further statement, of course you may.

A. That is all right.

Q. Look on page 29, Mr. Hart, about the 10th line. You refer to pending proceedings, a textile and a packing house products case.

A. Yes, sir.

Q. Would you give us the docket numbers of those?

A. The textile is I. and S. 3636, reopened.

Q. That is the old case.

A. Yes, the old case reopened.

Q. What is the packing house?

A. I am sorry I haven't the docket number. I can [fol. 5283] supply it. It is pending and perhaps there I should have said that we had a pending case on hides, interterritorial rates.

Q. I asked you about these two. Let's get that straight.

A. I will supply you with the number.

Q. The truth of the matter is there has been no packing house case filed. There has been one talked about but none has been filed. Isn't that right?

A. No. There is one on the suspended docket. The packers filed a case a year or so ago and it is still pending.

Q. You will write a letter then?

A. I think I can give it to you here. Mr. Wagner, have you got the number?

Mr. Wagner: I haven't the number, but it was filed by Swift and Company.

The Witness: It is now on the Commission's docket.

By Mr. Clark:

Q. Let's come to page 31, beginning with the second line, about rubber tires. Do you see it?

A. Yes.

Q. Let me ask you if the tire manufacturers in putting their plants in the South may not have had in mind serving Southern Territory? Wouldn't that be the logical thing?

A. I think so, Mr. Clark, but in any event I know this of my own knowledge, that they found it expedient in certain instances to ship the tires into the North, and I know there is an actual movement of tires, say, from the Gadsden [fol. 5284] plant of Goodyear to their plant in Akron that moves on combination rates, and the Southern put in a proportional rate to the level in order to permit them to do that.

Q. The manufacturer of whom you speak has a plant in Akron?

A. Yes.

Q. And there are other tire plants in Official Territory?

A. Yes, but I want you to understand I am not speaking for those interests, but I do know that condition exists.

Q. You say, "It is significant to know that the rates on processed rubber articles, such as tires, from the southern manufacturing points to Official Territory are very much higher than the rates in that territory."

It seems to me that theory of this rate-making would be that the manufacturers of tires in the South would be interested in a level within the South to serve Southern territory.

A. That is something I am not going into. I do know we had this same plant here, in Atlanta, that manufactures these rubber patches, did manufacture inner tubes for a period and he was not able to market his goods and he stopped making inner tubes for that very reason.

Commr. Aitchison: Before the next question is asked, I am left uncertain by Mr. Clark's question and the manner in which you have answered it whether or not the Southern region for which you are a pearing to testify is in- [fol. 5285] terested in the matter of your intraterritorial Southern rates.

The Witness: I didn't care to discuss the reasons for building this plant there, and that was the point I was not going into.

It is a fact that the distribution of certain tires, certain classes of tires I will put it, from the Southern plants of Goodyear and one of the other companies is preponderantly in Southern territory. I mean under normal conditions.

Commr. Aitchison: Mr. Hart, I am going to give you one more chance to answer my question, and it is an important question, and the question is whether or not the league for which you appear is interested in the Southern intraterritorial rates.

The Witness: Do you confine that generally or just to tires? Generally, certainly we are.

Commr. Aitchison: Mr. Clark's question and your answer would leave a doubt.

The Witness: I don't want to leave any doubt about that.

By Mr. Clark:

Q. Let's pursue it then just a bit further, in dealing specifically with rubber.

There are tire plants in Official Territory?

A. Yes, sir.

Q. The majority of the plants are there. Isn't that right?

A. Yes, sir.

Q. The greater population is in Official Territory.

[fol. 5286] A. That is correct.

Q. Where you have the greater population you naturally have the greater consumption of tires. Is that right?

A. Yes, sir.

Q. But when — of these concerns puts a plant in the South, he has already got a plant in Official Territory and he puts one in the South, wouldn't you say, as a man familiar with these matters, that was to serve Southern Territory?

A. I would ordinarily think that would be true.

Q. Then that plant would be more interested in the Southern Territory rates than in the interterritorial northbound rates.

A. Probably would.

Q. How would he feel about the southbound rates on tires from Official Territory to the South? Would he want the Southern level or the Official?

A. I think he would want as low a level as he could get.

Q. Assuming most shippers would want the lowest rates consistent with service, and all they can get, let's assume that. Let's take this so-called destination level theory of rates, and that is what this question leads to, are you for or against that?

A. I was for it as an expedient only. I am not for it as a principle.

Q. Let's be a little more specific. We take a commodity going northbound, that our southern manufacturers produce [fol. 5287] and wish to sell in the populous northern or eastern territory. You are interested you say in those rates here?

A. Yes.

Q. And you want those rates so your producers can compete. Is that right?

A. Yes, sir.

Q. Therefore you say that if you can go into his territory on substantially his level you have a competitive situation that suits your business and needs.

A. Yes, that would meet our immediate needs.

Q. In the reverse direction are you subscribing to the same level of rates southbound, or do you say that the northern shipper shipping into the South, in competition with your southern manufacturer, should ship on the Southern level of rates? What is your position there?

A. My position is here in this case that we should have a common level of rates, and therefore that question would not be involved.

Q. Then coming back to the rubber question you would be perfectly willing for the northern manufacturer of rubber to ship into the South on the level of rubber rates applicable into the East or interterritorially northbound. Is that your theory?

A. No.

Q. Your theory is general but it does not apply to specific [fol. 5288] cases.

A. Well, certainly if we had a common level of rates that would not apply. There would be the same rate in one direction as in the other direction. He would be able to ship just as low one way as he would the other.

Q. At page 35, at the top there, you speak of the South having gone forward in leaps and bounds industrially. Is that still in?

A. Yes, sir.

Q. That seems to be factual?

A. Yes, sir.

Q. Mr. Hart, you are here complaining, as I understand it, of a rate set-up which you indicate has throttled the South, yet here at page 35 you use the expression, "The South is going forward in leaps and bounds industrially."

How do you square those two positions?

A. I don't know how you want them squared.

Q. Now, you are the witness; you tell me.

A. I don't see anything to be squared about the two statements.

I merely adopted what you gentlemen have tried to prove here, that the South was growing very rapidly industrially, and I am conceding that that is true, and therefore we have got to have some change in this rate structure.

These are practically all new industries. We have the [fol. 5289] chemical industry and we have lots of new industries down there that we have never had before. We certainly have got to have rates to move the products of those industries, and I am trying to show you here that we can't get those rates, and that is what we are complaining about.

Q. One of your new industries, is that the industry making calendars?

A. No, that is not a new industry. The industry has been there for a long period of time, but they are trying to get into a broader distribution of those particular kinds of products.

Q. Since I mentioned calendars——

A. (Interposing) It isn't funny at all.

Q. I am not saying it is funny.

A. No, but you are laughing about it as if calendars isn't anything. That traffic is important to that producer and moves in carload quantities, and I think it is entitled to rates.

Q. I don't see anyone in the hearing room laughing, certainly not me.

A. You were indicating that perhaps calendars didn't mean anything.

Q. Let's see how much they mean.

A. All right.

Q. You said the Coast Line discontinued purchasing from [fol. 5290] your calendar man in Atlanta. I suppose they were shipped to the Coast Line at some point on the Coast Line, at Wilmington?

A. That is my supposition that they moved to Wilmington deadhead, yes; no transportation charge.

Q. You also said they diverted their order to a manufacturer at Chicago.

A. They did. His name is on the calendar.

Q. Do you not know the rate from Atlanta to Wilmington is 73 cents and the rate from Chicago to Wilmington is $1.25?

A. I know what the rates are.

Q. So the rate disadvantage did not deter the Coast Line.

A. Yes, sir, the rate disadvantage primarily on the inbound material is what affected that particular contract.

Q. Oh, then the question of raw materials is tremendously important.

A. Certainly it is in this instance.

Q. Don't you know, Mr. Hart, that the Southern carriers have been particularly liberal in helping their Southern shippers with respect to rates on raw material?

A. No, sir, not on the class or raw material I am talking about.

Q. Wouldn't you say the Southern carriers have been more than fair to the South?

A. Yes, I think the Southern carriers have done what they saw fit to do, but the problem we are confronted with [fol. 5291] is that we have got to deal with men in the Southern carriers' managements that do not have good judgment about the matter.

Q. And Southern industry has grown by leaps and bounds under those conditions?

A. Of course that is a cover-all statement. That is what you say it has, and we agree with you.

Q. I am quoting your exact language.

Mr. Norman: Read him the whole statement.

A. I didn't say——

By Mr. Clark:

Q. Didn't you just tell me that was true?

A. Of course the South is growing industrially, but it started from scratch, and you can't compare a growth from nothing as compared with some other market.

Q. Well, we all took the country from the Indians from scratch.

A. I agree with you.

Q. You say in your testimony, and I have heard it elsewhere, you said, "Past experiences are not indicative of revenue consequences that might conceivably flow from a readjustment in the present class rate structure in the South."

That is on page 36?

A. Yes, sir.

Q. Do I understand you think any rate adjustment should be definitely fixed for the future based on the present times and conditions?

[fol. 5292] A. Well, I wouldn't say they should be based on war conditions, but I think this Commission is pretty well informed as to what the conditions might be after the war.

We have got to forecast it. Certainly this Commission is in no different position, as I see it, than Congress over there legislating laws, and we have got to prepare for the future, and I think it is the duty of this Commission to forecast that future to the best of their ability.

Q. Isn't it true, Mr. Hart, that the manufacture and flow of traffic in ordinary civilian goods has been very much disrupted under war conditions?

A. Yes, sir.

Q. Today the traffic is largely of munitions of war and materials going in to make those munitions?

A. Yes. I wouldn't say a traffic test for instance today would be representative.

Q. There is quite a large volume of traffic of that kind moving today.

A. Yes, sir.

Q. That has not moved heretofore.

A. Yes, sir. It is moving on class rates today where under normal conditions it would not.

Q. You have no reason to suppose it will continue indefinitely.

A. No.

Q. So that today is not a representative period. It is more [fol. 5293] of an abnormal period.

A. That is correct.

Q. And yet you want the Commission to take today's views into consideration.

A. No, sir, I am not asking that they do that. I just got through stating that the Commission is well informed about conditions. There are just a lot of cover-all statements made by different witnesses about the low inbound rates on raw materials, and when you boil them down of course they did happen in the past, you got low rates on logs maybe, on pulpwood, and maybe a few low rates on pig iron, but that isn't what we are talking about here.

We appreciate that action by the Southern carriers in the past when these old lines of industry were building up, like the stove industry and when the paper industry came into the South, but I am talking about these new industries.

I mentioned this rolling mill, lead rolling mill in Atlanta. That mill is properly situated if they could get the proper inbound and outbound raw material rates.

We tried to make the Southern carriers put in the Baltimore rate to Atlanta on lead from the west. The best thing we got was to get the New York rate.

Baltimore is a keen competitor, and the Southern carriers are not liberal in many instances as they should be on these inbound raw material rates from other sections, particularly [fol. 5294] from Official territory.

I mentioned yesterday——

Commr. Aitchison: I think you have answered that question and a good many that have not been asked.

The Witness: Well, he asked me, Mr. Commissioner, about these raw material rates, and he didn't confine it to one. He had a broad question and I would like to tell him about some of them.

By Mr. Clark:

Q. Have you finished?

A. Yes.

Q. You recall you mentioned the rate on sterilized rags from Atlanta to New York State.

A. Yes, sir.

Q. You said it was a rate of 46 cents.

A. That was the rate the Southern Railway was willing to put in and I accepted it because I couldn't get anything better.

Q. All right, you were given a 46 cent rate?

A. Yes.

Q. The answer is yes?

A. Yes.

Q. That was a reduction of the rate from 75 cents?

A. Yes, it was classification basis.

Q. And your man got the contract, didn't he?

A. He did after that rate was put in.

Q. Then you talked about another contract that ran [fol. 5295] away up into some figures, I forgot the details of that, but your man also got that contract.

A. I don't recall.

Q. It was right in connection with the rags.

A. I don't recall that.

Q. Well, never mind.

A. I recall saying he lost a contract—I don't know what you are referring to unless you would mention the commodity.

Q. You did mention at great length wines.

A. Yes.

Q. And you said there had been refusal by the Official Territory lines, I believe, to join in some wine rate that the Southern lines had proposed. Do you recall that?

A. Yes.

Q. From whom did you get information that the Northern lines had refused to join?

Mr. Norman: I don't think he said that. He said it was still non-concurred in by the Northern lines.

Mr. Clark: All right. He made a definite statement, Mr. Norman, that he had been denied——

Mr. Norman: No, he didn't, and the record will so show, and I challenge your statement.

Mr. Clark: Let's ask the witness if he recalls what he did say.

The Witness: The facts are, Mr. Clark, that before I [fol. 5296] left Atlanta I merely checked the proposal that was filed at the request of Mr. Oliver, and I was told by the Southern Freight Association that it still remained non-concurred in by the Official Territory, and I was merely checking the status just like I would ask about any other proposal.

By Mr. Clark:

Q. If in the earlier part of your testimony you said the Northern lines had refused to join, that was an error?

A. I wouldn't say it was an error. It was merely a choice of language. I will say so far as I know they have not concurred in the Southern Railway's proposal.

Q. Then if you said that they had refused, that was an error.

A. As to this proposal, yes, but I would apply that to previous proposals that have been before them for five years that they absolutely refused to concur in.

Q. Did you hear Mr. McDonald's testimony on yesterday?

A. Yes, sir.

Commr. Aitchison: That is the second time he has testified to that fact.

By Mr. Clark:

Q. I want to know clearly if you are speaking, as you do, for the Southern Governors and apparently the same interests that ~~he~~ spoke for in general, do you subscribe to the Official Territory level of rates within Southern Territory?

A. Not as a whole.

Q. You do not?

[fol. 5297] A. I was talking about class rates here, Mr. Clark, and I wish you would confine your questions to the scope of this proceeding.

I am not going to talk about pulpwood or pig iron or some other commodity. If you want to take each one down the list, I will tell you what we want.

Q. The Chairman has pointed out on more than one occasion that technically all rates and ratings are here, and I will take first class rates in and of themselves, leaving out exceptions, and I will ask you, are you in favor of the eastern scale of class rates being in effect in Southern Territory.

A. I will answer this way. If I had had to make a choice, I would take that in lieu of what I have. I am talking about as to class rates.

Q. You were questioned from the bench at length yesterday along this line, and I was much interested but could not hear your answers——

Commr. Aitchison: I think I will just have to ask if you cannot restrain yourselves so that only one is talking at a time. This reporter is trying to make a record here. It is impossible for any human being to report two people talking at once. Just, please, be a little bit considerate of each other and of the reporter and of us.

By Mr. Clark:

Q. Let's come back to the class rates specifically as class rates, and I will ask you definitely the question. [fol. 5298] Instead of the present class rates in Southern Territory are you advocating and do you desire the eastern class rate put in effect within Southern Territory?

A. I would say yes.

Q. Now, the class rates, I take it you agree with me, standing alone mean little without the classification.

A. That is true.

Q. If you have the eastern class rates do you advocate the Official classification or the Southern classification?

A. I think we would have to take the classification along with it. I don't see any escape from that, unless there was a new classification made.

Q. You recall on yesterday, when Mr. Chairman Aitchison asked you about that, you said there were three classifications and apparently you wanted a little of all three of them.

A. No, I don't think——

Q. (Interposing) Today are you clear that you want the Official classification in Southern Territory?

A. I didn't say I wanted. I just answered your question.

Commr. Aitchison: My question was whether he considered the Official classification was adapted to meet commercial needs of the South.

Mr. Clark: That is much better put, Mr. Chairman.

The Witness: I think the record is clear about the matter.

By Mr. Clark:

Q. You think then it is better adapted to the needs of [fol. 5299] Southern industry and shippers than the present classification?

A. Yes, I think so, under the present industrial evolution that is taking place I certainly do.

Q. That brings us to the interterritorial class rates. Do — wish the same eastern level to obtain interterritorially and in both directions?

A. Whatever the level is, we want it uniform both directions.

Q. And the Official classification?

A. If that is proper, yes.

Q. That is no answer. You are speaking for a large volume of interests here, and we have to ask you these things.

A. In answering those questions, of course I don't mean it facetiously at all, but it is a rather unfair question to ask a rate man just point blank whether we want this or that, I mean without testing some particular class of traffic that might be involved, but I am talking now generally.

Commr. Aitchison: Now, Mr. Clark, I recognize, of course, the questions in the form you are asking are rather common before the Commission as to what a witness wants, but really basically the witness is here to give his knowledge of the facts and his expert opinion, rather than the question of what he wants.

By Mr. Clark:

Q. Mr. Hart, will you bear in mind when I speak of what you want I mean those things that you think are [fol. 5300] best adapted to the industry. I am sure you understood me.

A. I don't know; sometimes I think I understand you.

Commr. Aitchison: Well, if you don't know, that is enough.

By Mr. Clark:

Q. Then let's come back to it. You are speaking for Southern industry. That is a broad term, Southern shippers.

A. Yes, speaking for a good many Southern shippers.

Q. It is clear that you do want the eastern level of class rates and that classification as being best adapted to the needs of Southern territory.

A. I didn't put it that broad in my direct examination. I didn't advocate any particular level.

Someone asked me what I would suggest, and I said the appendix E scale was the best thing I had seen, and that is as far as I went.

Commr. Aitchison: I want to ask a question there. Bearing in mind the cases you cited yesterday, and in which you seemed to think the Commission had concurred, and possibly did, to what extent would your trouble be eliminated if the Commission would cease building rates on percentages of first class?

The Witness: Well, I would have no objection to that if a plan of that kind was adopted and a proper graded mileage basis was put in, it would suit me fine.

[fol. 5301] Commr. Aitchison: You say you haven't any objection to it. That is a pretty negative sort of statement. I asked what percentage of your troubles would be alleviated.

The Witness: It would be alleviated; of course it would depend upon the gradation of the scale.

Being primarily interested in longer haul traffic, if we had a proper banded scale, a scale that was properly banded, then it would suit us better than maybe a class rate adjustment that had a rather rapid progression in the index rate.

Commr. Aitchison: You are putting something in my question I didn't put there at all. My question didn't relate to the reformation of the scale. I was talking about stopping making rates on the basis of index 100, now.

Mr. Norman: Does your question contemplate leaving the class rates as they are, but just stop making the percentage of column rates?

Commr. Aitchison: My question was whether or not his present troubles would be alleviated if that practice was followed, to what extent they would be alleviated, if at all.

The Witness: Well, I don't know that I understand just what you have in mind.

Commr. Aitchison: You told us yesterday of a half dozen cases where you said you had gotten rates of 138 per cent of what your competitor had, simply because the Commission in prescribing rates had prescribed the [fol.,5302] same percentage on first class rates in the South as it had prescribed in the north.

The Witness: That is correct.

Commr. Aitchison: If instead of prescribing percentages of the first class rate, which you say is 138 per cent of the South as compared with the north, the Commission had prescribed actual scale rates which it found reasonable——

The Witness: (Interposing:) Yes, sir, I think that would take care of us.

Chmn. Alldredge: If there were still 38 per cent difference, would it take care of you?

The Witness: No, I am talking about the plan; I am not talking about a rate. That is the reason I emphasize my answer. Of course we would expect those rates to be relatively adjusted, of course.

Commr. Aitchison: What I got from the point of your objection was that because it is an easy and a convenient thing to do to refer rates to percentages of first class, that it is done oftentimes when it should not be done, and the result is, as you claim, an unjust rate.

The Witness: That is true. Of course the same injustice could be done——

Commr. Aitchison: (Interposing:) By prescribing a scale.

The Witness: By prescribing different scales; of course I realize that.

Commr. Aitchison: At least you would have the oppor- [fol. 5303] tunity to compare that scale with scales elsewhere.

The Witness: Yes, sir.

By Mr. Clark:

Q. Before you leave class scales, you have given us the view here that you and your southern shippers are dissatisfied with the present class rates. You want something else, but you are not quite clear to tell us what. If pressed, you say, "I would take the eastern level of class rates."

A. Yes, sir.

Q. And the classification of Official Territory?

A. Yes, sir, we would take that.

Q. Are you making any distinction in your views with regard to appropriate rate levels between class rates as such and your commodity rate adjustment of the various commodities.

A. Well, Mr. Clark, commodity rates are not involved in this proceeding, and I haven't testified as to my position about rates on any particular class of traffic.

Q. The pertinency of my question, Mr. Hart, is this. If we have a certain class rate level, apparently you wish it substantially reduced; that would be my view.

A. No, I don't think so.

Q. If you want an eastern level.

A. I don't want to agree that the eastern level would reduce your revenue on class traffic.

Q. Then, my dear sir, what is the argument about the [fol. 5304] difference in levels between Official and Southern Territory?

A. It is primarily the interterritorial, the barrier that is set up at the border which I complained about yesterday.

Q. Don't you think if we have interterritorial rates on the eastern level that we would have to have the same level in the South?

A. Yes, and I don't think if you took the eastern level today—tomorrow, I will put it,—and established it in the South as a whole I doubt if it would change your revenue very materially.

Q. Wait a minute. You agree with me though that the eastern level would have to become effective inevitably within the Southern Territory.

A. Yes.

Q. And now you say that wouldn't affect the revenue.

A. It would affect it some; how much I don't know, but it would not be material.

Q. Do you recall Mr. Kerr said it would be about $39,000,000 probably; you disagree with him?

A. Yes, because he didn't prove that at all and offered no support of that opinion.

Q. You know Dr. Edwards, of course, here?

A. Yes.

Q. Of the Commission's staff?

A. Yes.

[fol. 5305] Q. Do you recall he said there would be approximately $23,000 lost to the southern lines?

A. I don't know.

Commr. Aitchison: Are you going to argue this case right now, Mr. Clark?

Mr. Clark: No, sir. I asked him if he subscribed to the view and he said it wouldn't make any difference.

Commr. Aitchison: That ought to be enough.

By Mr. Clark:

Q. Let's come back to your commodity rates. If you cannot get money out of your class rate structure, don't you have to do something to your commodity rates?

A. You can't sell me on that idea.

Q. I am not trying to sell you, sir; I am asking you a simple question.

A. I am not going to discuss the commodity rates unless you insist on it. I will be glad to do it if the Commission wants to go into it.

Commr. Aitchison: What is the question?

(Pending question read.)

Commr. Aitchison: I think we don't have to have elementary transportation economics developed to such an extent on cross examination, Mr. Clark.

Mr. Clark: Strange to say, Mr. Chairman, that is the question he refused to answer. It is quite interesting to me, because we are interested in conducting a railroad transportation [fol. 5306] system in the South, and it is obvious we must have money to do it. I am sorry if it is thought that it is elementary.

Commr. Aitchison: I confess I think you are going a little bit too far in assuming that we don't any of us have any experience or knowledge of such elementary matters.

Mr. Clark: There is no such assumption to the bench. I was trying to get the witness,——

Commr. Aitchison: But it is the bench that is going to decide this question.

By Mr. Clark:

Q. Mr. Hart, you are here speaking for the Atlanta Freight Bureau, the Governors' Conference, is that right?

A. Yes, and the other southern traffic organizations, all of them except New Orleans.

Q. I don't recall. It is of course in the record, but you have left us under the impression that you speak rather generally for industry in the South. Is that right?

A. Well, I think that is in a general sense, true, yes, sir. Of course I am not speaking for certain groups like the paper group or the iron and steel group, who have their own people who have made statements here, I think.

Of course I have some heavy interests as well as light interests, and I am speaking for those specifically and generally of the smaller unorganized industries.

[fol. 5307] Commr. McConnaughey: Mr. Hart, I am very much interested in what portion of the dollar value you think you represent in the South that you are speaking for.

The Witness: You mean dollar value of products?

Commr. McConnaughey: That is right.

The Witness: Of course when you take the coal and iron and steel and paper, that is a pretty large industry in dollars and cents, but I am concerned about the smaller fabricator who can't expand under this rate structure.

Commr. McConnaughey: Could you give me a direct answer?

The Witness: No, I couldn't. I would have to make some figures, but offhand, the dollar value, probably they would be greater than iron and steel and coal and paper, but I don't know, but as to total the percentage against me would not be very great.

Commr. McConnaughey: You referred to the rubber industry a while ago, which as you know left Akron to some extent, Goodyear and Goodrich and Firestone.

The Witness: Yes.

Commr. McConnaughey: And went to Michigan and Texas and a number of southern states. Do you think freight rates had anything to do with their moving to those parts of the country?

The Witness: No, I think it was an economic consideration but still when they get these factories—a man that locates a branch factory of that type and he gets into the terri- [fol. 5308] tory, things develop that might change his entire set-up. It just isn't constant. Changed conditions cause changes in the plans originally made, and I don't think, for instance, that Goodyear intended to do other than have a local distribution in the South, for instance, out of their Gadsden plant, but the facts are that prior to the war they were shipping into eastern territory, for instance. They found after they got down there they could probably manufacture a particular class of tire that had been developed for a certain purpose and they found it more economical to produce that tire in the Gadsden plant, rather than in the Akron plant.

That causes a demand for rates that was not foreseen at the time that plant was put there. We have that to happen very often. You can't foresee what is going to take place when you build a new plant.

By Mr. Clark:

Q. Pursuing the question from the bench just a little further, you do not represent and speak for the coal interests.

A. No, we have no coal in Georgia.

Q. And iron and steel.

A. Yes, sir, I speak for the Atlanta steel interests, but not the Birmingham steel interests.

Q. Do you speak for Knoxville?

A. No, sir.

Q. Chattanooga.

[illegible]ol. 5309] A. There is a small steel mill at Knoxville.

Q. Chattanooga?

A. Not at Chattanooga.

Q. Gadsden?

A. Yes, sir, there is.

Q. Tallahassee?

A. Yes.

Q. Anniston?

A. Those are controlled by the Big Four in the north.

Q. You do not speak for the paper industry?

A. No.

Q. Except the Atlanta Paper Company.

A. I only speak for the fabricator primarily. We have no paper mills.

Q. Fertilizer?

A. Well, fertilizer is not involved—yes, I represent some fertilizers.

Q. Not the industry though in the South as a whole.

A. Not as a whole. They have their own organization.

Q. Automobiles?

A. There are no automobiles manufactured in the South. There was a manufacturer there at one time in Atlanta, but they had to give up.

Q. They ship them into the South?

A. Yes, they ship automobiles from the north into the South.

[fol. 5310] Q. And interterritorially.

A. Southbound, yes. They drive most of them.

Q. Let's take specific industries right now by name. Do you speak for Sears Roebuck?

A. Well, Mr. Clark, if you want this record to show who I speak for I will be glad to file a list of them and satisfy you.

Q. I didn't ask you that question. Do you speak for Sears Roebuck?

A. No.

Q. How about the Chevrolet people?

A. No.

Q. How about Fisher Body?

A. No, sir . . .

Q. How about Fulton Bag and Cotton Mill?

A. They have their own traffic men but they are in accord with our——

Q: (Interposing): I didn't ask that. Do you speak for them?

A. I don't speak specifically for them.

Commr. Aitchison: Mr. Clark, the function of a witness is to be a witness for the Commission. You asked him for whom he speaks; that question properly should be addressed to Mr. Norman.

Mr. Clark: Mr. Commissioner, he is the only man the southern manufacturers have put up that we can find out [fol. 5311] who he is talking about.

Commr. Aitchison: Who he is called for is for Mr. Norman to say.

Mr. Clark: Then I will ask you, Mr. Norman, who are you talking about when you give these various views?

Mr. Norman: He is talking about the South. He is not talking about any particular industry.

Mr. Clark: He has spoken of industry in the South, and that is an all inclusive term, and the point has been made that there is nobody disagreeing with this view of the Southern Governors and there has been evidence that Mr. W lell and Mr. Vogtle are in the great minority, and I want to know whether he speaks for these industries I am asking about.

Commr. Aitchison: You shouldn't ask whether he is speaking for them. You should ask whether or not when he testified with respect to the views of industry, as he understands it, whether there is a complaint or not, he had in mind such and such an industry.

By Mr. Clark:

Q. You heard the question from the bench, Mr. Hart, and I am going to ask you to answer that question, in the light of these industries: Hercules Powder.

A. No.

Q. Southern Agricultural Chemical.

A. No.

Q. Exposition Cotton Mills.

[fol. 5312] A. They are in the textile group—yes. I have been authorized by the Alabama and Georgia textile mills.

Q. Mr. Kilgore is the traffic manager?

A. No, Mr. Murphy is the traffic manager and he is right here.

Q. Do you speak for Mr. Cunningham and his association?

A. No, sir, I certainly do not.

Q. He represents most of the textiles in the Piedmont section, doesn't he?

A. No, sir.

Q. He does not?

A. The Piedmont section, yes.

Q. You don't speak for him?

A. No.

Q. How about Southern Cottonseed Oil Company?

A. They are a northern controlled group.

Q. How about Swift & Company?

A. A northern controlled group.

Commr. Aitchison: That isn't the question.

The Witness: I told on the record yesterday, I said in qualifying, I said that these outside industries, there are a good many of them that I don't speak for.

Commr. Aitchison: He is trying to develop what they are.

The Witness: And their rates are not involved in this proceeding at all, and there wouldn't be any reason for me to speak for them.

[fol. 5313] Commr. Aitchison: That is not important. The question is whether or not when you were testifying with respect to the views of the South you meant the views of such and such an industry. That is capable of an extremely simple answer.

The Witness: Mr. Aitchison, it is, I agree with you, but Mr. Clark's purpose—or I mean I am interpreting his purpose——

Commr. Aitchison (Interposing): Mr. Norman is going to have a chance later to develop, if he wants to and thinks it is important, but your function is to answer and answer directly, and let's get on with this.

Mr. Norman: Mr. Chairman, I don't think it is competent for him to ask the witness if he speaks for some industry or some special group whose rates are not involved here. Why should he speak for them? Why should anybody speak for them?

He is asking this witness, do you speak for a concern whose rates are not involved here, and he is just going right down the line to make it appear that there are all these big companies that he doesn't speak for. Of course nobody speaks for them here because they are not interested.

Commr. Aitchison: I don't think you are quite right about that. Considering the nature of the testimony we have had here, it seems to me it is proper that Mr. Clark should follow this line within reasonable limits, of course subject to the ruling that Mr. Clark keeps on violating, that he isn't to ask the witness for whom he is speaking.

[fol. 5314] Mr. Clark: I asked him to answer the question in your words. You put it better than I could.

By Mr. Clark:

Q. I will give the name of the industry; you know what we are talking about.

A. Yes, and you know who I am talking for too.

Q. How about the lumber interests?

A. I represent some lumber people, and to the extent that I represent them I am talking for them.

Q. That means some local concern like Willingham.

A. No, I represent some major ones too.

Q. You also represent such concerns as Davidson-Paxton?

A. I represent all the retail people.

Q. That is really your main representation?

A. No, sir, it is not.

Q. Your main membership?

A. No, sir, it is not. That is the smallest membership we have in the organization is the retail stores.

Q. And yet, Mr. Hart, you must understand you are here speaking for the Southern Governors of several of the states.

A. You are not going to tell me who I am speaking for.

Mr. Norman: He is not speaking for the Southern Governors. He is testifying as a witness offered by me as counsel for the Southern Governors.

Mr. Clark: We can only ask the witness; we can't ask counsel.

[fol. 5315] Commr. Aitchison: Yes, you can ask Mr. Norman on whose behalf this witness is called.

Mr. Clark: Yes, I would like to have you say.

Commr. Aitchison: He answered it once. He said he was called on behalf of the Southern Governors.

Mr. Clark: I didn't hear it.

By Mr. Clark:

Q. Let's come back to the civic organizations of Atlanta. Are you familiar with such organizations as the Chamber of Commerce?

A. Yes, sir.

Q. The Junior Chamber of Commerce?

A. Oh, yes, they have them in every city.

Q. How about the Optimists Club?

A. They have one there.

Q. The Civitan?

A. Yes, we have a Civitan.

Commr. Aitchison: Are these shippers?

Mr. Clark: I don't know.

Commr. Aitchison: You ought not to bring them in unless they are. You will be speaking about the Confederate Veterans next.

Mr. Clark: Well, that is a good idea.

By Mr. Clark:

Q. You don't speak for the Confederate Veterans.

[fol. 5316] A. Well, I might; you don't know.

Q. Are they shippers?

Mr. Norman: Mr. Chairman, to follow this thing to its logical conclusion we ought to have an election. I don't see how you are going to get any place if it can't be said that the public officials represent a section, and if you want to go back of that and find out what the people think, you have got to have an election. I think to give Mr. Clark what he wants we will just have to have an election.

Mr. Clark: Maybe we will some day. The Governors have threatened it. That is all.

Commr. Aitchison: Any further cross examination of Mr. Hart?

Mr. Grubbs: Yes, sir.

Commr. Aitchison: Mr. Grubbs.

Cross-examination.

By Mr. Grubbs:

Q. I believe you testified yesterday that no mattresses were manufactured at and shipped from Birmingham.

A. Oh, well, there is a small mattress factory, but there isn't a commercial plant as we know it.

You have small mattress plants all over the country. You will find small mattress plants located all over the country, but I am talking about plants that produce mattresses for marketing purposes generally.

Q. Mr. Hart, I place before you Exhibit 84 produced by [fol. 5317] the witness Edwards—not Dr. Edwards—in this proceeding, showing the rates on mattresses from Birmingham as compared with the rates on mattresses from Chicago, and I will ask you if you didn't prepare this exhibit.

A. Yes, I prepared it.

Q. Are you preparing just paper rates to submit to the Commission in this proceeding?

A. No, it wasn't prepared for that purpose.

Q. Now, you assailed in your written testimony at some length section 1 of Exhibit 180 presented by the witness Morris.

A. Yes, sir.

Q. I want to read you just one line from the testimony, this being taken from page 4037, the testimony being that of witness Morris:

> "I have undertaken to show here what the effect would be upon the southern commodity rate structure confining it to the column rates and exceptions of the prescription of the Appendix E scale, the Official Territory scale, with either the Official Classification ratings or the present Exception ratings."

Do you recall that statement by witness Morris?

A. Yes, sir.

Q. Is that statement perfectly clear to you?

A. No, sir, it isn't clear—perfectly clear—and I don't [fol. 5318] think it would be clear to anyone when you examine the exhibit as to what it was intended to show.

Q. Isn't it true that all your criticism is based on the assumption that Mr. Morris did not say, "Confining it to the column rates and exceptions"?

A. I think the record would——

Q. (Interposing:) Isn't it true? That is all I asked you.

A. I will say yes, if that satisfies you.

Q. That satisfies me.

In the course of your written testimony you indicated that the southbound movement is largely in forwarder cars. Is that correct?

A. Well, I said——

Q. (Interposing:) Is it correct?

A. Yes—I didn't say all of it was in forwarder cars. I said——

Q. (Interposing:) What is your statement?

A. I think the statement would be that there is an important—well, I can't give you the percentage, I wouldn't want to guess at the percentage, but there is a very large tonnage of southbound less than carload traffic that is handled by the freight forwarders. I told you there *was* 9,000 cars in the year I took of foreign traffic from Central Territory into the South.

Q. You don't mean the Southern Railway is not moving [fol. 5319] large quantities of less carload freight in their own package cars?

A. Well, they still operate in package cars.

Q. Do you or do you not?

A. I wouldn't say large quantities. I don't know what you mean by large quantities. Are you talking about relatively as related to the——

Q. (Interposing:) I simply want to know what you meant when you said that the railroads' less carload movement is going largely by forwarder.

A. It is.

Commr. Aitchison: I think that was to Atlanta, wasn't it?

The Witness: Yes, to Atlanta; I can say that for Atlanta.

Commr. Aitchison: I am asking Mr. Grubbs.

The Witness: I thought you were asking me.

Commr. Aitchison: No.

Mr. Grubbs: It was my understanding the witness' testimony was broader than that. Am I correct in that understanding?

The Witness: I will say, of course I don't know exactly what goes into Memphis or into Birmingham or into New Orleans; I am not in position to test it, but I have tested it at Atlanta, and that is the largest receiving point in the South.

By Mr. Grubbs:

Q. Are you in position to indicate to us the extent of forwarder movement as compared to the extent of movement other than by forwarder?

A. I would say that the——

[fol. 5320] Q. (Interposing:) Are you or not? That is the question.

A. Yes, the preponderance of movement into Atlanta of merchandise traffic is by the forwarder.

Q. Are you in position to give any figures on it?

A. I haven't them here. I have some.

Q. Are you confining yourself altogether now to Atlanta?

A. Yes, sir.

Q. Are you in position to indicate to us the proportion of total southbound less carload traffic that moves by forwarder?

A. Well——

Q. (Interposing:) Are you?

A. Yes, if I had the figures here I could give it to you.

Q. Do you have the figures?

A. Yes, sir.

Q. Can you give them to us?

A. I guess I could.

Q. Let's have them.

A. I haven't got them with me.

Q. I thought you said you did.

A. No; I know approximately what it is. It runs well over 50 per cent, without naming a figure.

Q. You say the total southbound movement——

A. (Interposing:) Of merchandise traffic.

Q. Of merchandise traffic is 50 per cent——

A. (Interposing:) Or more, by forwarder.

[fol. 5321] Q. Mr. Hart, you participated in this general case involving forwarder rates here, the all commodity rates in the South recently?

A. Are you talking about the general case or the I. and S. case?

Q. I am talking about the general case.

A. Yes, sir.

Q. And isn't it true that every witness for the railroad there testified——

Commr. Aitchison: No; no.

Mr. Grubbs: Very well. I will withdraw that.

By Mr. Grubbs:

Q. Mr. Hart, you don't mean to represent that carload traffic that moves on class rates southbound is moving by forwarder, do you?

A. No, I was talking about merchandise traffic.

Q. You are talking about less carload traffic.

A. You know what I mean.

Q. You didn't say it and I want to clear the record.

A. I think the Commission understands what we are talking about.

Commr. Aitchison: I know, but some United States Judge may not.

The Witness: Yes, I am talking about less carload merchandise traffic, what we call consolidated traffic.

By Mr. Grubbs:

Q. Mr. Hart, I wish you would turn to sheet 5 of your [fol. 5322] Exhibit 220.

First of all, I would like to direct your attention to the column headed "Percentage of Official Territory Level".

A. Yes, sir.

Q. Do you mean to represent to the Commission in this proceeding that the K-2 Q-1 basis between the South and Official Territory as a whole is generally no higher than the K-2 scale?

A. I don't think the exhibit has any such thing on there, but if you want to ask me that question, I will be glad to answer you.

Q. I think your figure, when you show that the interterritorial level, that is the level from the South to Official Territory, when you show it to be 138 per cent, I think the implication is there that the K-2 Q-1 basis is no lower than the K-2 scale. Isn't that true?

A. That isn't what you said, but I explained that yesterday that this is just a general test and you can take one point and it would be under the scale, and another point and it would be over it, but just as a general test it is fairly accurate.

Commr. Aitchison: You left the impression in answer to a question of mine that the combination of the K-2 and Q-1 scales from representative points in the South to points in the North would average about the K-2 scale.

[fol. 5323] The Witness: They would for Central Territory. I said to you that as to Trunk Line Territory it would be something less than that.

Mr. Grubbs is including all Official Territory.

By Mr. Grubbs:

Q. The reason I did so is because your exhibit is headed, "A Comparison of the General Level of Freight Rates Expressed in Percentages to the First Class Rate Level Applicable on These Commodities Intraterritorially in Southern and Official Territories."

Your exhibit doesn't say anything about Central Territory.

A. In answer to Mr. Aitchison I said if we took all the origins in Southern Territory to all Official Territory, I am talking about including New England and all the destinations in Official Territory, and measured them by the K-2 scale, you might reach 135 or 136 or some figure like that; it would not be exactly 138.

Q. Have you made any such calculation and have you arrived at any such result?

A. I have made a lot of studies since 13494. I have tested it pretty fully. I haven't filed it here.

Commr. Aitchison: The answer is this, then, Mr. Hart, that you are testifying from results of a good many years of experience with these and you are not testifying from any special study that was made.

The Witness: That is correct. In section 3-B of my [fol. 5324] Exhibit 88, Mr. Aitchison, you will find I separated Central Territory from Trunk Line Territory, and I found there that the Commission was about correct—I give the Commission credit one time for being right—that the general level of first class from the South to Trunk Line in New England was about 92 per cent of the K-2 scale and I used that figure in showing the relationship in this other exhibit. I wanted to be fair about it. I don't want to be unfair about it.

By Mr. Grubbs:

Q. If you are going to be fair about it you ought to strike out wherever you have shown Official Territory here, and substitute Central Territory.

A. I can rework and take 92 per cent of those figures and show Trunk Line, but for the purpose of this exhibit it did not appear necessary.

Q. If it is going to be confined to Official Territory, as you show it here, then all the figures you have shown under percentage of Official Territory level must be discounted. That is true, isn't it?

A. No, I don't want to discount it at all. If it means anything to you, I am willing to confine it to C.F.A. and I.F.A.; it would suit my purpose just as well.

Q. Let's test your general knowledge for a moment on this percentage. You know that the Commission subsequent to the Southern Class Rate Case materially reduced rates from some parts of the South to Official Territory, don't you?

[fol. 5325] A. Yes, in the border cases I know they reduced them interterritorially.

Q. And the percentage from Kentucky and North Carolina is very much lower than 38 per cent.

A. Yes, sir.

Q. And substantial movements take place from and to Kentucky and North Carolina.

A. Yes, I think that is true, Mr. Grubbs, I will concede that.

Q. That isn't taken into account when you use this 38 figure, is it?

A. Yes, sir, it was taken into account in this other as to C.F.A. territory, yes.

Q. You mean to say that the Kentucky rates and the North Carolina rates are taken into account in arriving at a figure of 138.

A. Well, if you will refer to sheet 3, section 2 of my Exhibit 88, you will find where I have shown there a great many southern origins or destinations, whatever you want to term them, have shown to the extent in which the first class rates are over or under the K-2 scale. That gives you a fair test.

Q. That isn't an answer to my question.

My question is, have you given adequate consideration to the Kentucky and North Carolina rates in determining [fol. 5326] this figure of 138 where the ratings are the same in both territories?

A. Yes.

Q. Are you willing to stake your judgment as a traffic man on that? Are you or not?

Commr. Aitchison: He doesn't have to stake his reputation.

The Witness: I made——.

Commr. Aitchison: Now, we have no question before us.

By Mr. Grubbs:

Q. Going back just a minute, I overlooked asking you if it isn't true that from the east to the south the railroads do not have *in* forwarder rates?

A. No, sir. The forwarder traffic, for instance, from the east to Atlanta moves by truck and it is a very large volume.

Q. But I am speaking about railroad tonnage now. There is no railroad tonnage from the east; that is correct, isn't it?

A. That is correct. Since the boats went out, the all rail routes are handling considerable merchandise traffic into the south.

Q. Now, Mr. Hart, I want to ask you a few questions about each of these commodities on page 5 of Exhibit 220 that you indicated you conceive to be in the case. The first of those is calendars.

A. Yes, sir.

Q. Do you know how many manufacturers of calendars there are in the South?

[fol. 5327] A. Well, of course every printing plant is a potential manufacturer of calendars.

Q. My question was simply do you know how many there are in the South:

A. I don't know. I think perhaps Nashville and Atlanta printers are the only ones that have attempted to get into that particular character of printing.

Q. You say the only printers of calendars in the South are at Nashville and Atlanta?

A. I think they are the only ones that have attempted to get into that line of printing.

Q. What is the name of the Atlanta calendar manufacturer?

A. Dittler Brothers.

Q. How long have they been in existence?

A. I guess 30 or 40 years.

Q. How long have they been shipping calendars in carloads?

A. Only that one contract they had with the Gulf Refining Company.

Q. When was that contract entered into?

A. I think it was 1941; it was either 1940 or 1941.

Q. And that was for a shipment of calendars to go to where?

A. To go to different distributing points in the north. I gave you a list of them yesterday. It is in the record.

Q. It is in the record?

A. Yes, sir.

[fol. 5328] Q. Do they ship in carload quantities within the South?

A. No, sir.

Q. Coming next to the electrical appliances, who is the manufacturer?

A. Walker Electric Company. The catalog was here yesterday.

Q. The Walker Electric Company, and what is the principal commodity shipped by the Walker Electric Company?

A. Outlet boxes manufactured from iron and steel and aluminum.

Q. How long has that concern been in business?

A. Ten years, but they haven't been manufacturing boxes that long.

Q. How long?

A. Several years; I don't know the exact time.

Q. What was their sales volume say three years ago?

A. I can't give you that at the moment.

Q. Do you know what it is today?

A. No, I haven't those figures with me.

Q. Do you know how much of their production is sold in Southern Territory?

A. Most all of it at the present time. They tried to go into Official Territory.

Q. What parts of Southern Territory do they reach?

A. All of it.

Q. Do they ship throughout the South?

A. Yes.

[fol. 5329] Q. How many shipments have they made?

A. I don't know.

Commr. Aitchison: Is it necessary to go into the business of a particular shipper?

Mr. Grubbs: I was trying to test his knowledge, he having testified, your Honor, as to the economic conditions of these several industries.

Commr. Aitchison: We will not permit you to do it under Section 20 of the Act.

The Witness: I was not prepared to go into that here.

Commr. Aitchison: You don't have to. I have ruled the question is not proper.

Mr. Grubbs: Thank you very much.

Commr. Aitchison: Any further cross-examination?

Mr. McCollester: Yes, I have some questions.

Commr. Aitchison: Mr. McCollester.

Cross-examination.

By Mr. McCollester:

Q. Would the alleged grievances of those concerning whom you have testified be satisfied if — class rates in Official Territory and the classification in Official Territory were put on the Southern basis and the interterritorial rates made on the Southern basis?

A. Yes.

Q. Do you seek to have parity accomplished in that way?

A. No.

[fol. 5330] Q. Would that have the effect of increasing the levels of the interterritorial rates both northbound and southbound?

A. Well, I would say substantially northbound, but to a lesser degree southbound.

Q. How about the class rates?

A. I am talking about class rates.

Q. But it would also increase southbound to some extent?

A. Sometimes, yes; particularly to border territory.

Q. Just so that I may be sure that the record is clear on that point, from the standpoint of my interests in the case, may we understand that sheet 5 of your Exhibit 220 does not fairly reflect the ratio of the level of the class rates or of the rates there shown from the South to Official Territory in relation to the level of the rates on the same commodities or same classes within Official Territory?

A. I wouldn't say it doesn't fairly do that for the purpose that I have prepared the exhibit.

I have explained that, that I recognize the fact that this is a general comparison, you understand, Mr. McCollester, and I think if you include Trunk Line territory in New England those figures would have to go down a bit, but it wouldn't be enough to mean anything to me, because if we had 130 per cent it would be just as objectionable as 138 per cent.

Q. Which exhibit more fairly reflects the ratio of the interterritorial level to the official level, sheet 5 of your Exhibit [fol. 5331] 220 or sheet 16 of section 11 of your Exhibit 88?

A. The latter would be more nearly the similar figures because I have separated the territories from which rate structure is entirely different.

Q. And will you take my word for it that the latter, that is, sheet 16 of section 11 of Exhibit 88 out of 34 rates shows only 4 with the ratio where it is as high as 138 per cent.

A. What sheet are you referring to?

Q. Sheet 16, section 11.

Mr. Norman: We will take your word for it, subject to check.

Mr. McCollester: All right.

The Witness: You mean section 2, don't you?

By Mr. McCollester:

Q. It looks like section 11; maybe it is supposed to be a Roman II Is that figure 2 or 11?

A. It is a 2, it is a Roman II.

I think the exhibit itself shows that, but as I recall it that exhibit was prepared for an entirely different purpose and has a very limited number of points.

Q. Does the truth depend upon the purpose of an exhibit?

A. Of course the figures are on that exhibit and show what the percentage is. I am not denying that your statement is correct on that particular sheet of 16 points.

Q. On page 33 of your prepared statement, where you deal with the subject of History, you make the statement [fol. 5332] that it has been said that the invention of the cotton gin by Eli Whitney in 1793 changed the South's destiny from that of industry to that of agriculture.

Can you refer me to any publication, any authority in history, where that has been said?

Commr. Aitchison: I can. I was reading it last night.

Mr. McCollester: I would like to have it in the record.

Commr. Aitchison: In one of these 25 cent editions of the history of the United States that was just gotten out.

Mr. McCollester: By whom?

Commr. Aitchison: I don't know.

Mr. McCollester: I think it is about a 25 cent statement.

Commr. Aitchison: It is by a couple of eminent historians. I could supply the name if you like.

The Witness: Well, you are entitled to your opinion.

By Mr. McCollester:

Q. Well, the invention of the cotton gin also lead to the same extent to the industrialization of New England, did it not?

A. It probably did.

Q. And the South had the same opportunity to employ the cotton gin for ginning right in the South.

A. I think if you read my statement you know what I mean. I think it is perfectly clear and it is a truthful statement.

Q. To what extent was the South industrialized in 1793?

A. I would have to go back of course in history and get that.

[fol. 5333] Q. You have made the statement.

Commr. Aitchison: We are as able to take official notice of things of that sort as this witness is to testify about them.

Mr. McCollester: That is all.

Commr. Aitchison: Any further cross-examination of Mr. Hart?

(No response.)

Commr. Aitchison: Mr. Norman, do you have any further questions?

Mr. Norman: Just one.

Redirect examination.

By Mr. Norman:

Q. Mr. Hart, you were asked about representing the textile industry in Georgia and Alabama.

That industry has a complaint pending before the Commission, has it not?

A. Yes, sir.

Q. And you didn't mean you were representing them in that they were trying to get their relief here instead of there, did you?

A. No, I meant to say that so far as the Georgia and Alabama mills were concerned, they were certainly in sympathy with what we were trying to do. That was what I intended to convey.

Of course I was a witness in I. and S. 3636, and I know pretty well their position.

[fol. 5334] Mr. McDonald: Could I ask the witness a question?

Mr. Hart, do you understand in speaking for the Southeastern Association of Railroad and Utilities Commissioners that I advocated the present commodity rate structure within the North within the South?

The Witness: No, Mr. McDonald, I didn't understand it that way.

By Mr. McDonald:

Q. When Mr. Clark, in interrogating you, sought to secure your concurrence in any such interpretation as that, did you intend to concur?

A. I didn't concur.

Q. And were not my questions relating solely to the present class rate adjustment which had been proposed by the Rate Committee in this case?

A. I thought that was what you had in mind.

Q. And your response as to whether or not you represented Sear- Roebuck, isn't it a fact that General Wood, president of Sears Roebuck, resigned from the Chicago Chamber of Commerce because that Chamber was resisting the South's effort to secure uniformity?

A. I am not familiar with that.

Q. Don't you know Mr. Charles Waters, vice president of Sears Roebuck, has appeared on the Governors Conference many times and has made speeches advocating uniformity?

Commr. Aitchison: We will give you a subpoena for [fol. 5335] that genleman, if you want it.

By Mr. McDonald:

Q. In your response that you do not represent the specific businesses and industries named, isn't it true you do represent the sentiment of the smaller shippers in the South?

A. I certainly think so. I certainly know I represent my own interests, and I know what their sentiment is, and I think the sentiment is pretty generally that way throughout the South.

I have a very intimate contact with the shipper interests throughout the South, not only in Atlanta, and I think I am qualified to answer that in the affirmative.

Mr. McDonald: Thank you.

Mr. Clark: One more queston.

Recross examination.

By Mr. Clark:

Q. Do I understand correctly that in advocating the eastern level within the South and interterritorial application, that is conditioned upon retaining your present commodity rate adjustments?

A. No, I wouldn't say that. Of course when you say "commodity rate adjustment" that is a broad term, Mr. Clark; that means a lot of things.

You have got me confused now as to what you call commodity rates.

Your witnesses say percentage column rates in one instance are commodity rates, and in another instance they [fol. 5336] are not; I don't know what you are talking about.

Q. Commodity rates, as such.

A. What do you mean by that?

Q. Well, we will just——

A. (Interposing) Give me a commodity.

Q. We will call them column rates. Would that make it clearer?

A. Yes.

Q. Including all except the classification.

A. I think that would have to be reexamined.

Q. Reexamined?

A. And maybe some of them would have to be changed.

Q. Are you willing to have these rates increased?

A. I don't know until I test them, until we got to that class of traffic and it may be we would and maybe we wouldn't.

Q. Is it true if you can get your class rate structure reduced and into effect, you will oppose every increase on any commodity rate that you presently have?

A. I haven't done it in the past. You came along after 13494 and increased every one of them.

Q. Wouldn't that be your position in the future?

Commr. Aitchison: I think that is a little speculative.

The Witness: It would depend upon the needs of the industry.

Commr. Aitchison: Mr. Hart, when I am trying to rule that the question is one that you need not answer, don't go ahead and answer it.

You are excused.

The Witness: Thank you, sir.

Mr. Murphy: I would like to ask one question.

Commr. Aitchison: What is your name?

Mr. Murphy: Murphy.

Commr. Aitchison: For whom are you appearing?

Mr. Murphy: Georgia and Alabama Textile Association.

Recross-examination.

By Mr. Murphy:

Q. Mr. Hart, in making reference to the Association, you were connected with the 3636 case and the reopened case for the Association; I believe that is correct.

A. Yes, sir, I testified for the mills in those cases.

Q. As to the statement made here, you confine that for the purpose of clearing any understanding that might be gotten out of some previous testimony that the mills were satisfied with the rates. Isn't that correct?

A. Well, yes, I had reference to the policy more than anything else of the Alabama and Georgia Textile Mills, or their sympathy with this particular proceeding.

Q. I mean though by this, that we are not—you don't mean to say you were authorized to say we were participating in this case, but just to say that as to the industry being satisfied would be borne out in 3636; isn't that correct?

A. Well, I would say that is correct.

[fol. 5338] Mr. Murphy: Thank you.

Commr. Aitchison: There seems to be nothing further and you are excused, Mr. Hart.

(Witness excused.)

Mr. Wagner: If the Commission please, may I renew my request to either read into the record or have copied into the record five sentences from the Bureau of Census report which was referred to before? The parties on this side of the table have no objection.

Commr. Aitchison: It may be copied in.

(The statement from the Bureau of Census report is as follows:)

"While the quantity of goods produced is, for most purposes, a suitable standard for measuring industrial expansion or contraction, the conversion of quantities of dissimilar products to a common basis by means of index numbers is too laborious for application to small areas. Increases or decreases by physical quantities of goods manufactured may not parallel closely corresponding increases or decreases of wage jobs, for the extent to which machines are employed may determine largely the amount of human labor required. For example, about 1.5 per cent fewer wage earners were employed in the manufacture of cotton goods in 1929 than in 1919, although the physical volume of output increased by an estimated 30 per cent. The meat pack- [fol. 5339] ing industry, too, employed 24 per cent fewer wage earners in 1929 than in 1919, but increased its physical output of products by approximately 5 per cent. The index of physical output of all manufactures increased about 38 per cent from 1919 to 1929, while the number of wage jobs decreased almost 2 per cent."

J. T. Ryan was sworn and testified as follows:

Direct examination.

By Mr. Norman:

Q. Mr. Ryan, state your name, address, experience and qualifications.

A. My name is J. T. Ryan. I am executive vice president of the Southern Furniture Manufacturers Association, with headquarters at High Point, North Carolina.

The Southern Furniture Manufacturers Association is a voluntary unincorporated association of furniture manufacturers in the 13 Southern states.

From January 1, 1912 to November, 1942, I was secretary and treasurer of the organization, and was made executive vice president last November.

During all of these years we have maintained a traffic department, and I have actively represented our members in proceedings before this Commission, before railroad rate committees, and other bodies having to do with freight rate adjustments.

[fol. 5340] Q. What is the purpose of your appearance here?

A. I appear in rebuttal to certain statements which I understand have been made in the record, to the effect that the southern industry is not supporting the effort to bring about an equality of class freight rates, and also that the Official classification carriers since the decision in the so-called Southern Governors Commodity Rate Case have not declined to join in the establishment of competitive commodity rates from the South into Official Territory.

Q. Please briefly describe the adjustment of furniture rates.

A. Generally speaking, today the furniture rates are published as exceptions to the various classifications and class rate tariffs in the form of numbered classes, percentages of first class as class rates, and also percentages of first class stated in the tariffs as commodity rates.

However, in most instances exceptions provide for the alternative application with a classification basis proper so that the classification basis proper represents the maximum rates.

It is a fact that since 1932 that generally speaking the rates on furniture, with a few minor exceptions, are determined with direct relationship to the first class rates.

It is therefore apparent that the Southern furniture industry is greatly interested in the level of the first class rates, because it is the basis for determining the rates on furniture.

[fol. 5341] Q. What would be the effect on your adjustment of the parity of first class rates?

A. One of the greatest obstacles that stands in the way of bringing about a proper adjustment of furniture rates is the maladjustment in the first class rate, particularly the southern first class rates as compared with the Official territory first class rates.

The rates on furniture from the Southern Territory as a whole are too high, relatively, when compared with the level of rates in Official Territory for equivalent service.

Consequently, I favor a complete competitive adjustment of rates on furniture as between the North and South.

Q. And in both directions?

A. And in both directions. I mean there, if it is competitive in both directions, Mr. Norman.

Q. What has been your experience now with reference to securing the concurrence of Official carriers in application of rates from the South to Official Territory on Official Territory basis?

A. I think in answering that question I should briefly outline some of the background of the furniture rate adjustment prior to the Commission's decision in Docket 17,000 Part 5, the furniture investigation, and efforts made since that decision to bring about a proper parity of the Southern [fol. 5342] rates with Official rates.

In that case it was established that the movement of furniture from southern manufacturing plants was on commodity rates, not only into other territories, but also in Southern Territory.

Those rates at the time the case was tried were as low, and in most cases lower than the rates prevailing within Official Territory.

In that case we sought to bring about an equalization of the rates. Such equalization would have, of course, required advances as well as reductions.

Generally speaking, it would have raised the level of the Southern rates, yet we advocated that because we felt it was proper to maintain a parity, even though to maintain the parity meant an increase in our rates.

The Commission, however, in that case found that the classification proper and the class rates were reasonable maximum rates on furniture, and made definite findings as to the classification which resulted.

Less than carload the Commission approved uniform ratings in all territories.

Thus, an article that the Commission found first class to be reasonable, that first class rate was established in all territories.

Consequently, of course, under the maximum basis, the [fol. 5343] less than carload rates as within and between the several territories would reflect the full classification difference that is the maximum basis.

However, as I have stated, the carriers are operating a lower basis than found reasonable by the Commission for the purpose of meeting truck competition. At least that was the reason given when these exceptions were established.

Following the decision in this case, the Southern carriers found it necessary to revise their commodity rates to govern to the Fourth Section, and in making this revision, the Southern carriers undertook to equalize the northern-southern level of rates and put them on a strictly competitive basis.

The only method they could find of doing that would be to relate the Southern rates on furniture to the first class rates which would clear the Fourth Section. Consequently they undertook to establish this competitive basis by establishing percentages of first-class that would approximate the northern level of rates.

In the meantime the Official Classification carriers, following the decision in the furniture investigation, found it necessary to lower their basis of rates on furniture within our own territory to meet the competition.

It might be stated that furniture, generally speaking had always moved in Official Territory on the full classification basis, whereas the reverse was true in other territories. [fol. 5344] The commodity rates in Official Territory *was* the exception rather than the rule, whereas in the South commodity rates were the rule rather than the exception.

The Official Lines established in the fall of 1932 so-called truck competitive ratings on furniture in exceptions, the basis being on furniture less than carload class on all kinds of set-up furniture, except furniture rated lower than second class, and second class on all types of K.D. furniture unless the classification basis were lower.

On carloads they established a series of five ratings with a graduated scale of minimum weights. The basis that was established at that time is substantially in effect today.

The scal referred to I think are in the record, perhaps in several places, but they were specifically placed in the record by the witness Bowman at Indianapolis. I think you will find them on pages 3195 to 3199 of the record.

Following the establishment of the truck competitive rates in Official Territory, as I have previously stated, the Southern carriers undertook to equalize.

Mr. Clark: Mr. Commissioner, may I interrupt here? Here we are clearly dealing with truck competitive rates. They would hardly come under the head of class rates by any classification.

Furthermore, as I understand these furniture rates, they are column rates published as exceptions, and when I was [fol. 5345] examining Mr. Hart I understood you to say

I should not press him on certain commodity rate adjustments. That being so, I object and move to strike what has gone before.

Commr. Aitchison: I think it is important for us to know the reason which underlies these numerous exceptions because we have the question before us of making a classification.

The fact that the Southern carriers have voluntarily made exceptions to the classification and have maintained them is some evidence as to what a reasonable classification should be, and the witness is entitled, I think, to give his understanding of what the reasons were which led to the making of those exceptions.

Mr. Norman: What the witness is coming to—in the first place, to show these rates are controlled by the classification proper. The exceptions provide they shall be maximum rates.

Commr. Aitchison: But they are still maximum rates, regardless of whether they are exceptions or not.

Mr. Norman: That is right.

Commr. Aitchison: They cannot extend the classification rates.

Mr. Norman: That is right, and in that way they are involved. But what the witness is coming to, he is showing this background to show the effort the southern carriers made to get a parity of rates northbound, and the fact the [fol. 5346] northern carriers declined to give it, and he will be there in a moment.

Mr. Clark: By the same token, your Honor, all commodity rates involve the same elements of classification as do the column rates.

Commr. Aitchison: There has been no attempt that I know of to prevent anybody from giving us material evidence with respect to the kind of a classification we should make.

Mr. Clark: A while ago during the course of this hearing you made the point that no one had objected to certain testimony. I thought I might be waiving the views I had if I didn't rise and note an objection. If it is overruled I am out.

Commr. Aitchison: Answer the question.

By Mr. Norman:

Q. Proceed, Mr. Ryan.

A. Proposals were then made by the Southern carriers to establish rates on furniture from the South into Official Territory, a percentage of first class, which would result in rates that approximated the level within Official Territory for equal distances.

For example, they proposed on furniture of less than carload——

Commr. Aitchison: You don't need to go into examples. You have the thing that was proposed.

The Witness: I will waive that less than carload, but I [fol. 5347] do specifically want to refer to some carload ratings.

Commr. Aitchison: Is it typical?

The Witness: It is typical. It carries a point.

On furniture in carloads the principal movement is on a 12,000 pound minimum, and that is the minimum prescribed by the Commission.

The Commission prescribed in Official Territory second class 85 per cent of first class in Southern Territory, and between Southern and Official third class, which is 70 per cent of first class.

The Official lines reduced that 85 per cent rating by exception to 65 per cent, a reduction of 24½ per cent under maximum basis.

The Southern carriers proposed 48 per cent of first class to equalize with 65 per cent of first class and in an approximate way it would have resulted in the equalization.

The Official lines were unwilling to join in that. They finally offered 53½ per cent of first class, which represented the same percentage reduction under the maximum basis as they had made in their own territory. Consequently that basis would reflect the full difference in the class rate scale as between the reduced levels in the two territories.

That is an instance where the Official lines definitely refused to equalize, and I will come to that a moment later.

Commr. Aitchison: Did the Southern carriers accept that?

[fol. 5348] The Witness: The Southern carriers 'reluctantly accepted. They were under compulsion of this Commission to readjust their rates, because the existing commodity rates were in violation of the Fourth Section, and as I have stated those existing commodity rates, generally speaking, were lower than the Official level.

That adjustment was made effective December 5, 1932.

Immediately, although very little furniture had moved from the South by truck, the movement started by truck.

While these rates were published as truck competitive rates to meet truck competition, actually the rates were raised. They were in the ridiculous position of raising a rate in order to meet truck competition, and that actually took place, and the tariff was so published early in 1940, and prior — that day the Southern carriers had met up with us to find out why they had lost the furniture traffic.

We pointed out this rate adjustment had caused it. We made a traffic test and submitted it to them which showed 95 per cent of the furniture movement *was* from the Carolinas and southern Virginia to Baltimore and Washington was by truck, 75 per cent to Philadelphia, and 50 per cent to New York, and intermediate points.

The Southern Carriers then said, we will undertake to do something about it, and they filed proposals in January, 1940, Southern Freight Association Submittal Nos. 21324 [fol. 5349] and 21744, to establish specific commodity rates to meet this truck competition.

Incidentally, these commodity rates would not have been below the northern level.

Hearings were held before the Trunk Line Committee in New York, their hearing No. 1307 in March of 1940, at which there were various appearances.

We appeared in support of the proposal, and incidentally, representatives of Southern carriers appeared before the Trunk Line Committee and sought to have them approve this proposal in order to increase the rail movements.

There were objections made by northern manufacturers on the grounds that the truck competition adjustment rate in effect was satisfactory, and to change the rates from the South would necessitate a big revision within Official Territory, although there we were not proposing lower rates than in Official Territory.

The Trunk Line Association declined to concur in the adjustment.

The matter was reopened, another hearing was held in the fall of 1940, and the proposals were again disapproved by the Trunk Line Committee.

I point out, Mr. Norman, that that was after the Southern Governors decision.

Q. A year after.

[fol. 5350] A. A year after *was* the last hearing, pressure brought to bear was so great upon these Official lines that they did not concur in it, although it meant a movement of some seven or eight thousand cars a year that they would have gotten perhaps if these rates had been reduced.

That was not a request for general equalization into Official Territory, although it would have equalized it to the Atlantic Seaboard, and we believe would have met truck competition.

Q. And the level proposed there was no lower than the going level in Official Territory?

A. That is true, sir.

Because of that situation and because of the numerous efforts we have made from time to time to get the clearance of the Official lines in an equalized basis of rates, we are convinced that it can be done only if required by this Commission, or if first class rates are prescribed on the same level in the two territories or between the two territories.

Commr. Aitchison: Does that conclude your statement?

The Witness: Yes, sir.

Commr. Scott: You referred to the great pressure which was brought. By whom was it brought?

The Witness: The pressure was brought at these public hearings by manufacturers located in official territory. Early in one hearing—perhaps I ought not to testify to it, [fol. 5351] a threat was made—the threat, we will divert our traffic to the truck lines if you reduce the *reduce the* rates from the South.

Commr. Aitchison: Cross-examine.

Cross-examination.

By Mr. McCollester:

Q. When did the furniture industry begin to develop in the South?

A. Around in the late 80's.

Q. And has its development been fairly steady since that time?

A. Yes, sir.

Q. It has grown quite considerably, has it not?

A. Yes, sir.

Q. It has changed, has it not, from an industry producing the lower grades of furniture so that now it produces the finest grades of furniture?

A. No, that is not true. The southern furniture industry produces a type of furniture that is purchased in the mass markets, that is the medium price and cheap furniture such as you will find in most of the department stores and installment stores in the City of Washington, and not the higher grades.

Q. I don't include the fine cabinet work.

A. But the good commercial grade, yes, sir.

Q. Would the furniture industry of the South be in favor of having rates put upon whatever may be the uniform [fols. 5352-5353] percentage of the Southern first class level if that was made uniform throughout Official Territory?

A. I am not sure that I get your question.

You mean if you transferred to Official Territory the present Southern level of furniture rates and make that the overall basis?

Q. Well, yes. I mean furniture rates are now percentage of first class.

A. Yes.

Q. And suppose the first class rates in Official Territory were put upon the Southern level and the same percentage continued, would that benefit the Southern furniture industry?

A. To apply the Official percentage to the Southern scale of rates?

Q. That is right, within Official Territory and from the South to Official Territory.

A. It would raise the rates from the South to apply the Official Classification ratings to the Southern Territory level of rates and would make them much higher than they are today.

Q. Do you advocate that?

A. Absolutely.

Cross-examination.

By Mr. Clark:

Q. Mr. Ryan, you have testified with respect to the competitive necessity due to the publication of northern interterritorial rates to market your products.

[fol. 5354] A. Yes, sir.

Q. I want to ask you why, if I understand your testimony correctly, is it necessary to have a reduction southbound into your territory in order to achieve that northbound result which you seem to favor.

A. Mr. Clark, that would not be necessary to bring about that equalization, but I point out this, that in the negotiations between the Southern carriers and Official carriers to bring about this adjustment, the Southern carriers themselves agreed to apply that level in both directions.

Q. Tell me, just what are you dealing with there when you say what the Southern carriers wished to do.

A. I am saying this. I don't know what they wish to do right now, but I think that at the time this adjustment was proposed, preceding the publication of 1932, I attended the public hearings at *the* Buffalo and elsewhere, and representatives of Southern carriers agreed to apply the equalized percentages in both directions.

Q. Mr. Ryan, that is not an answer to my question.

A. Pardon me?

Q. You are here today, as I understand it, espousing rates in both directions.

A. Yes.

Q. And you are speaking of the difficulty of getting northbound rates.

[fol. 5355] A. Yes, sir.

Q. And you testify as supporting your view that there should be southbound rates?

A. My testimony was in rebuttal of the testimony that I understand has gone into this record that the Official lines since the Southern Governors Case will permit this sort of thing.

Q. Will permit——

A. Will permit the Southern carriers in equalizing the rates.

Q. Then all your testimony about the difficulty of getting the northern lines to join has faded out of the picture.

A. No, I am stating that as far as we are concerned it is a fact that the Official lines will not join the Southern carriers.

Q. You are saying they won't?

A. Yes, sir.

Q. In order to get your northbound rate adjustments, you want to apply the same thing southbound.

A. Yes, sir.

Q. Do you appreciate that would bring the northern shippers into your territory?

A. Mr. Clark, I contemplate this thing in this case, general equalization of the first class rates east of the Mississippi River.

Q. I believe you told Mr. McCollester that the furniture [fol. 5356] industry has improved a great deal in the South.

A. Yes, sir.

Q. How much do you ship into Official Territory? What proportion of your production?

A. The last study we made of that kind of representative shippers, individual shippers, it varies; it depends upon what they make and what markets they are seeking, but we found a surprising thing, the movement is in proportion to the population.

Q. That still isn't an answer, Mr. Ryan, to my question.

A. I mean by this, that we ship into Official Territory the proportion of our production that is represented by their population to the total population approximately.

Q. Do you recall the exhibit that Dr. Aitchison put in, the green-backed exhibit in this case?

A. No, sir, I have not seen it.

Q. Suppose you look at page 15, furniture, and tell me if that doesn't show approximately 52 per cent is shipped to Official Territory of your total production. Is that right?

A. I don't know whether it is right or not. Show me what you are talking about.

Q. The circle there, Mr. Ryan.

Mr. Norman: He can refer to that on brief. Why should he ask the witness to take an exhibit and tell us what it shows?

[fol. 5357] The Witness: I know nothing about this.

Commr. Aitchison: You can direct his attention to it if you are going to follow it up with a question.

Mr. Clark: Yes, sir.

Commr. Aitchison: But not ask him what the exhibit shows.

By Mr. Clark:

Q. I am giving you the benefit of having seen evidence in this case.

Now I want to ask you, as a representative of the furniture industry, is that your view of the proportion?

Commr. Aitchison: Before he answers that, he is entitled to know what the document is. It is an analysis of the waybills of the carload traffic of the country for two days.

Mr. Clark: I handed it to him and Mr. Norman seemed to object to him looking at it. I tried to be fair with the witness, Mr. Commissioner.

Commr. Aitchison: You have got a question on the record that he hasn't answered.

Mr. Clark: He can if he wants to.

The Witness: What is the question?

By Mr. Clark:

Q. I asked you what proportion of your production you shipped to Official territory, and you went into a question of population.

To make it clearer, I handed you an exhibit of record to see if we could agree on that figure, and I was stopped.

I will ask you again what proportion of your total pro- [fol. 5358] duction of furniture, of the total you represent, is shipped into Official Territory.

A. Mr. Clark, the last test we made, which was several years ago, showed between 35 and 40 per cent of the southern production is sold in Official Territory.

Q. What percentage is marketed within Southern Territory?

A. I don't recall the exact figures; probably 16 to 20 per cent.

Q. I want to call your attention to the exhibit of Dr. Aitchison and ask you to examine it and see if you don't agree that 52 per cent is nearer correct.

A. No, sir, I do not agree. I agree the waybills show it; but I want to call your attention to this fact——

Mr. Norman: Page 15, Mr. Commissioner.

The Witness: No, I do not agree that represents what we shipped into Official Territory.

By Mr. Clark:

Q. You say it is 35 to 40 per cent?
A. Yes, sir.
Q. Is that at the present time or what period have you in mind?
A. I have that in mind for the last several representative years.
Q. I take it the present moment is perhaps a bit abnormal is the reason I wanted you to get to a more normal period.
A. Of course today war conditions have changed traffic.
[fol. 5359] Q. I am asking you to take a normal period, say 1939.
A. I would say 35 to 40 per cent of the production is sold in Official Territory for the reason that there are more consumers in that teritory than in any other territory. There are more people that want furniture.
Q. You have to have customers or there would be no business.
A. True.

Mr. Clark: Thank you very much.
Mr. Bell: May I ask one question?

Cross examination.

By Mr. Bell:

Q. Would you briefly state what the reasons were for the establishment, growth and development of the furniture business in the South?
A. Mr. Commissioner, if you care for me to do so, I will undertake to answer it. I doubt if it could be answered briefly—the development of any industry.

Commr. Aitchison: I presume that was all covered by the report in the Commission's furniture case, was it not?
The Witness: Yes, sir. However, the business originated in the South for the reason it was a wooded area; lumber was available. They did the natural thing, they manufactured the wood into a finished product that could be sold at a profit. That was the beginning of it.
Commr. Aitchison: You can go back further and say there was a time when the South had the manorial system

[fol. 5360] ~~of~~ production of everything that was needed on the place, right on the place.

The Witness: Yes, sir, that was true prior to that time, but the growth of the industry is due in my opinion and my considered judgment to the enterprise of the men behind these establishments.

The most highly mechanized furniture plants in the United States are in the South, in North Carolina and Virginia.

In that area they found they had to be efficient to meet the competition of the old established sections and to produce products at a price that would move them.

We were breaking into a well-established and entrenched industry.

Consequently, in the development I think today the South, and I know the plants are more highly mechanized as a whole than the plants in other parts of the country. I am going to qualify that by saying there are tremendously efficient manufacturers in every part of the country in the furniture industry.

There are highly efficient manufacturers in Pennsylvania and other states, that actively compete and can produce goods as cheap or cheaper than they can be produced in the South.

The cost of production is not controlled by the area in which the plant is located. The cost of production is controlled by the efficiency of the management and the availability of materials.

[fol. 5361] Mr. Bell: Thank you.

Cross-examination.

By Mr. Hollopeter:

Q. Mr. Ryan, I believe you answered a question of Mr. Norman's awhile ago that you would be in favor of furniture rates being equalized in both directions provided there was competition in both directions. Am I correct in that?

A. Perhaps I didn't state clearly what I meant. I meant this, and we would not object to the rates being the same in both directions providing the southbound rate was not lower than the interterritorial rates we are paying in the South.

Q. Is it your position today there is competition in both directions, that is from the North into the South, as well as from the South into the North?

A. Yes, there is competition in every direction on every commodity and in every industry.

Q. Then I understand it is your position whatever is done with the rates, they should be the same in both directions without any qualification with respect to competition.

A. I am qualifying it by stating that to establish one common level of rates would correct the situation we are complaining of now. If that is not done, then we would say the principle of the Southern Governors Case should apply.

Q. I believe a little later I understood you to say you were shipping into Official Territory a proportion of your [fol. 5362] production that was equivalent to the proportion of the population in that territory. Is that correct?

A. On second thought, that is not correct.

Q. What is correct?

A. 35 to 40 per cent.

Q. Of your production?

A. Of the production in the Southeast.

Q. Then do I understand you are disposing of about, oh, 16 per cent, would you say, in the South?

A. 16 to 20 per cent in the South, yes, sir.

Q. Comparing the population in the area of the South with the population of the area in the north, would you say that per cent going into the north is a lesser proportion compared to the population than that which you are putting into the South?

A. I won't make a calculation for you, but I will give you the population of those areas if you want it for the record.

Commr. Aitchison: That doesn't mean much unless you give the movements.

Mr. Norman: He has given the movements.

The Witness: He wants me to compare them with the population and give him the per cent.

Commr. Aitchison: You did that originally and then you said you made an error and now he wants to know——

The Witness: I am qualifying; I said from 35 to 40 per [fol. 5363] cent is shipped into Official Territory; 16 to 20 per cent is consumed in Southern Territory.

By Mr. Hollopeter:

Q. Then may we clear it up by asking where the balance of your production goes?

A. It goes to the territory west of the Mississippi River.

Commr. Aitchison: Are you speaking of all of the Southern Territory now?

The Witness: Yes, sir.

By Mr. Hollopeter:

Q. That would leave, would it not——

A. (Interposing): 35 to 40 per cent.

Q. (Continuing): About 40 per cent going into the territory west of the Mississippi River.

A. Yes.

Q. That is doing that under the present rates. Do you contend you should still be able to move more of your production into Official Territory than that amount?

A. I can't answer the question, but I do want to point out this. Bear in mind, sir, as I previously stated, much of this traffic is not moving into Official Territory by rail.

Q. How does it move?

A. It moves by truck.

Q. Does any of it move by water, coastwise, or did it before the present situation?

A. No, very little.

Q. Do you feel that your truck rates, on the basis that [fol. 5364] you have just stated, that is what moves much of your production into Official Territory, should be a basis upon which the rail rates in Official Territory should be fixed?

A. No, sir.

Mr. Hollopeter: That is all.

Commr. Aitchison: When you speak about 35 or 40 per cent going to Official Territory, what is your 100 per cent?

The Witness: 100 per cent, Mr. Commissioner, would be the approximate total production of the Southern factories. Do you want that in dollars?

Commr. Aitchison: No. Regardless of how it moves?

The Witness: Yes, sir.

Commr. Aitchison: The exhibit which was shown to you represented something like 52 per cent but that was related to the movement by rail as 100 per cent.

Mr. Norman: Yes, that is right.

The Witness: There is a possibility that that is the rail proportion. In the furniture industry, in gathering statistics, we have no uniform units. Furniture runs from a small end table on up to a large break front cabinet. Consequently all our statistics within the industry are on a dollar basis rather than on a tonnage basis.

Commr. Aitchison: If you are comparing the 35 to 40 per cent which moves to the north, Official Territory, with your total production, you have to take into account that a [fol. 5365] part of your total production moves from the South either by truck or by private conveyance and part is sold locally at the point of manufacture.

The Witness: That is true. Generally speaking, however, the bulk of the production is in towns of 2,500 or under, and the local sales will be only a small proportion of the production.

Commr. Aitchison: How about your truck movement, or movement by a contractor or by a private vehicle?

The Witness: Well, it is moved by private trucks owned by the shipper. It is moved on private trucks owned by the dealer who comes to the factory and gets the furniture.

Commr. Aitchison: How about common carrier?

The Witness: It moves by common carrier.

Commr. Aitchison: Is the aggregate of those methods of conveyance considerable?

The Witness: Yes.

Chmn. Alldredge: Do you export any furniture?

The Witness: Export furniture? No. The exports from the United States on household furniture are practically nil, probably one-fourth of one per cent.

Chmn. Alldredge: All your consumption is domestic.

The Witness: Domestic, except of course the United States and Canada, but for the past two years there has been an embargo on furniture into Canada.

[fol. 5366] Commr. Aitchison: Any further questions?

Commr. Scott: Mr. Ryan, if those proportions as to your territorial distribution, were you speaking for the entire southern industry, or for the group of them that you represent?

The Witness: Well, I would say this, Mr. Commissioner, that we have a total of about 230 or 240 members.

They produced last year 95 per cent of the furniture produced in the South, so I would say that we represent the vast majority of the production in the South.

Commr. Scott: And the figures you gave are probably true for the whole 100 per cent?

The Witness: Yes, sir.

Commr. Scott: Thank you.

The Witness: Will you bear in mind that I gave those as an approximation based upon my knowledge and there might be some variation.

Cross-examination.

By Mr. Clark:

Q. Mr. Ryan, let's see if I clearly understand you, in view of the questions from the bench and from Mr. Hollopeter.

Is it true that of your total production that is shipped by rail to the several territories, that approximately 50 per cent moves to official territory, and around 20 per cent within Southern Territory, the remainder west of the Mississippi River?

[fol. 5367] A. No, I said between 35 and 40 per cent into Official Territory.

Commr. Aitchison: I beg your pardon, Mr. Ryan. He asked you whether you were speaking of movement by rail or your total production, and you said total production.

The Witness: You are talking about rail?

By Mr. Clark:

Q. I asked you the specific question.

Please read the question and let's get it exactly right.

(Pending question read.)

A. Mr. Clark, let me correct what I have said by stating this, that I could not tell you what proportion of the total rail movement moves into Official Territory.

My statement is that of the total production we estimate that between 35 and 40 per cent of it is sold in Official Territory irrespective of the transportation agency used.

Q. Perhaps we can get it this way. Can you tell me approximately what percentage moves by truck and what by rail?

A. No, I can't for this reason. The long haul business west of the river from the Southeast, none of it moves by truck.

To the Atlantic Seaboard, to the City of Washington, 95 per cent of the furniture produced in North and South Carolina and southern Virginia moves by truck into this city.

Something like 95 per cent to the City of Baltimore; 75 per cent to Philadelphia and 50 per cent to New York. [fol. 5368] In other directions the percentage differs. Of the total I don't know how much moves by truck. We have made no test.

Q. In view of your truck movements I am surprised that you are so interested in your rail rates northbound.

A. We are, sir. We are confronted by a rubber situation and we are further confronted by the fact that the truck lines will eventually follow the rail adjustment.

Commr. Aitchison: You are excused.

(Witness excused.)

Mr. Norman: That completes my presentation.

Commr. Aitchison: Mr. Bee.

Mr. Bee: We have one witness.

J. C. Murray was duly sworn and testified as follows:

Direct examination.

By Mr. Bee:

Q. Your name is J. C. Murray?

A. Yes, sir.

Q. You testified in this case at Columbus, Ohio?

A. Yes, sir.

Q. And in that case you presented certain exhibits, Mr. Murray?

A. Yes, sir.

Q. Thereafter the witness Tannehill presented an exhibit calling attention to what he considered were certain errors in that exhibit presented by you?

[fol. 5369] A. That is right.

Q. Have you prepared an exhibit correcting your original exhibit in line with the errors called attention to by Mr.

Tannehill and stating those errors that he calls attention to which you will not accept?

A. Oh, what I did was to check his exhibit and recheck mine.

Mr. Bee: May we have that marked as an exhibit?

Commr. Aitchison: That will be Exhibit 221.

(Exhibit 221, Witness Murray, marked for identification.)

By Mr. Bee:

Q. Will you please explain briefly what Exhibit 221 is?

A. Exhibit 221 merely takes Mr. Tannehill's exhibit and my Exhibit No. 96 and admits on the face of the exhibit wherever Mr. Tannehill was correct in his exceptions to my exhibit, and also shows with authority the instances in which Mr. Tannehill's criticisms are incorrect.

Mr. Bee: We offer Exhibit 221.

Commr. Aitchison: Without objection it is received.

(Exhibit 221, Witness Murray, received in evidence.)

Mr. Bee: That is all.

Commr. Aitchison: Cross examine. (No response.)

Mr. Bee: That concludes the surrebuttal.

(Witness excused.)

[fol. 5370] H. N. Roberts was sworn and testified as follows:

Direct examination.

By Mr. Barron:

Q. Will you state your name, your position and briefly your experience?

A. My name is H. N. Roberts; 720 Cotton Exchange Building, Dallas.

I am chairman of the Texas-Louisiana Freight Bureau. I have had more than 25 years experience as a traffic officer of the southwestern railroads.

I am a practitioner before this Commission.

Q. Have you prepared or had prepared under your supervision an exhibit which you wish to introduce in this proceeding?

A. I have one exhibit with some supplementary pages. It has been distributed.

Mr. Barron: That will be what number, Mr. Chairman?
Commr. Aitchison: That will be exhibit 222.

(Exhibit 222, Witness Roberts, marked for identification.)

Mr. Barron: The supplemental matter that is also attached with Mr. Roberts' exhibits are pages that are to be placed in the back of Exhibit 222 instead of making two exhibits.
Commr. Aitchison: Let us understand about this now. Off the record.

[fol. 5371] (Discussion off the record.)

Commr. Aitchison: This supplementary matter will be marked Exhibit 223.

(Exhibit 223, Witness Roberts, marked for identification.)

Mr. Bee: On behalf of the southwestern interests, especially Texas, I desire to offer an objection to this testimony and this exhibit because it relates entirely to intrastate rates within the State of Texas, and has no bearing on the issues here.
Mr. Barron: This is rebuttal testimony, if the Chairman please, of Dr. Frederick that was put in either at Indianapolis or Columbus, I do not recall which, wherein he made the unqualified statement that because of the rate situation, the industries in Texas had been retarded and and they couldn't industrialize Texas.
We want to show you the complete picture by showing what the railroads have published in the line of rates to accord the manufacturers in the State of Texas.
Commr. Aitchison: I am interested to know why an exhibit of this magnitude has to be put on on short notice. Has Texas been given an opportunity to examine this?
Mr. Bee: We have no objection to the exhibit as far as the time is considered. We have had an opportunity to examine it. We believe as far as the exhibit itself is con-
[fol. 5372] cerned that it portrays facts. There are certain conclusions reached by the witness that I desire to ask a few questions about, but the exhibit itself, there is no ob-

jection to it, if the Commission feels that it is a matter pertinent to this investigation.

Commr. Aitchison: Obviously the rates which may be going within a state have got some bearing and some influence with us when we come to write a classification.

Is there objection to the statement being copied in, gentlemen?

Mr. Bee: No, none whatever.

Comm'r. Scott: I wonder if Exhibit 222 might show on its face what it is.

Mr. Barron: No, it does not, Mr. Commissioner. Please answer the Commissioner, Mr. Roberts.

The Witness: It is a comparison of the rates in Texas intrastate with the rates in Central Freight Association Territory on the same commodities for corresponding distances.

I have had prepared under my direction and supervision an exhibit consisting of 126 pages, which has been consolidated in book form. This has been identified as Exhibit No. 222. The purpose of its preparation is to present to this Commission a number of rate comparisons covering a large volume of commodities which originate and move between points in Texas. This exhibit shows the Texas rates for representative distances compared [fol. 5373] with the rates in Central Freight Association Territory for similar distances.

We have had in Texas during the past four years several rate hearings before the Railroad Commission of Texas wherein the level of rates in Central Freight Association Territory and in Texas were brought into issue.

In my section of the country there is one school of thought which has proclaimed far and wide that Texas rates and rates in the Southwest are 175 per cent of the Central Freight Association level. The sponsors of this unproven theory appear to base their claim on the so-called Tennessee Valley Authority Report.

There are others who contend that Texas rates are 160 per cent of the Central Freight Association level. The Freight Rate Equality Federation, sponsored by the West Texas Chamber of Commerce, appears to lean to the 160 per cent theory.

In all instances when testimony has been given by either group their conclusions have been formed by taking the first class rates in the Central Freight Association Territory and in Texas and the Southwest and drawing a mathematical average for comparison one territory versus the other.

Very important factors which make it almost impossible to reach a conclusion regarding the relationship between the body of rates in one territory and that by another *has* been overlooked.

One of the most important factors toward trying to es- [fol. 5374] tablish a relationship of this kind, and one which is openly disregarded, is the competition of traffic in the respective territories. The composition of traffic in Texas is dissimilar indeed to the composition of traffic in Central Freight Association Territory.

Another important factor is the fact that average hauls very greatly between the Central Freight Association, on the one hand, and Texas on the other. There is a broad dissimilarity also between the commodities which make up the preponderance of tonnage within the same territory.

There is a third factor also, which is that in each territory exceptions are provided to the Classification. These exceptions differ in each territory and are designed to adapt the class rate bases to the traffic moving therein.

To demonstrate the dissimilarity between the traffic being handled in Central Freight Association Territory and that moving in Texas, and to demonstrate the fallacy of the conclusion that Texas rates are generally higher than Central Freight Association rates, my Exhibit No. 222 was prepared. I shall undertake to discuss the series of statements included in the exhibit in the order in which they are bound.

It is not contended that any one or all of these comparisons should form a proper basis for arriving at an exact relationship, but I do contend that they demonstrate that any general statement which has been made to the effect [fol. 5375] that the rates in Texas are higher than Central Freight Association rates is not correct.

This exhibit has been divided into a series of statements, separated by a blue sheet between each series. These series are further identified by a letter prefix, beginning with "A" and running through "J".

Pages A-1 and A-2 show comparisons between Texas intrastate and Central Freight Association first class rates up to 900 miles. The Central Freight Association class rates do not extend beyond that distance. The Texas class rates, however, extend to 1500 miles. It seems to me that it [illegible] be sufficient here [illegible] discontinue the comparisons a[illegible] miles, which as I have just stated is the maximum Central Freight Association distance.

In preparing Pages A-1 and A-2, I have used I. C. C. Docket ~~13535~~ mileage blocks and the last column shows the percent which the current Texas first class rate is of the current Central Freight Association first class rate for an equal distance.

At the end of the statement, on page 2, it is shown that the average percent which the Texas first class rate is of the average first class rate in Central Freight Association territory is 151 per cent. It is the first class rates which are used to determine the going factor when rates are based on a certain percentage of first class either by the Classifi- [fol. 5876] cation, Exceptions to Classification, or by specific provision in a commodity tariff. There are many such rates related to first class in both Texas and Central Freight Association Territory which will be compared on other pages of this exhibit.

The volume of tonnage moving under first class rates in Texas is relatively small. For example, according to the 49th Annual Report of the Railroad Commission of Texas which is covered — the calendar year of 1939, the Class I Railroads of Texas originated a grand total of carload traffic amounting to 23,714,555 tons.

The total weight of less than carload traffic originated by the same group of carriers for the same period amounted to 393,679 tons. This latter figure represents approximately 1.5 per cent of the total, and it represents all of the less than carload tonnage originated by the Class I railroads in Texas.

In 1940 the l.c.l. tonnage was 1.5 per cent of the total. Not all of this less than carload traffic moved under first class rates by any means. The preponderance of less than carload movements in Texas takes place under the various mixtures which we have in that state; such as the grocery, hardware, and drug mixtures comprising about 1000 articles. There is scarcely an article used in the modern home which is not shipped under one of these mixtures, the average rating being less than third class. I do not have figures [fol. 5377] to show the amount of tonnage which actually moves subject to first class rates or higher, but it is safe to say that not as much as ¼ of 1 per cent of our total tonnage moves under first class rates or higher.

Pages B-1 to B-14, inclusive, show the Classification and commodity bases in Texas and Central Freight Association Territory. For example, on acids the classification rating in Texas is Column 100 or first class, while the going commodity basis is 77½ per cent of first class. In the Central Freight Association both the classification and the going commodity basis are Column 100 or first class.

If this Exhibit is carefully examined, it will, I believe, demonstrate to anyone the futility of forming a conclusion regarding rate levels by comparing class rates between two territories when the differences in the classification and the class rates, themselves, are as great as they are shown to be between Texas and the Central Freight Association.

There are 296 exceptions to the Classification in Texas; of these 273 provide lower rates in Texas than would be provided by the use of the Classification itself, while on the same 296 articles, only 124 have exceptions providing for lower rates in Central Freight Association Territory.

Five of the exception ratings in Texas provide higher than the Classification; in Central Freight Association [fol. 5378] Territory there are eight such exception ratings. To get the full import of this comparison I have totaled the percentage of first class in each of the rating columns and find that the exception ratings in Texas are in the aggregate of 70.6 per cent of the classification ratings, while in Central Freight Association Territory the corresponding percentage is 89.2 per cent. To be a little more specific, attention is invited to the tabulation on page B-14.

By reason of the exceptions Texas shrinks its average ratings 21 percentage points, which is the difference between 64.6 and 43.6, while on the same articles the Central Freight Association by exceptions shrinks its average ratings only 6.6 percentage points, the difference between 60.8 and 54.2. The average of exception ratings shown on this statement in Texas is 43.6 per cent, and in Central Freight Association 54.2 per cent. Thus we find the ratings included in this exhibit for the Central Freight Association are on an average of 124 per cent of those in Texas.

Putting it another way, Texas average ratings is 82 per cent of the Central Freight Association.

Pages C-1 to C-41, inclusive, show numerous comparisons between Texas rates which are the same as, or lower than the rates on the same commodities in Central Freight Association Territory for representative distances.

Page 2 of the statement is an index of the commodities [fol. 5379] treated, showing the page number on which the comparisons may be found. The selection of commodities was not made at random, but because they originate and move in substantial volume in Texas. Other commodities could have been added, but these are representative and we believe sufficient to support our contention.

Pages D-1 and D-2 show comparisons on vegetables, mixed carloads, in Texas, with the rates in Central Freight Association Territory. This statement should be considered in connection with pages C-1 to C-41, inclusive, but because of the various rates applicable in Central Freight Association Territory we have found it necessary to be more elaborate in our presentation.

Attention is called to the examples of relationships found at the bottom of page D-2. This shows that we have rates in Texas which are as low as 58 per cent of the rates on the same commodity in Central Freight Association Territory.

Pages E-1 to E-5, inclusive, show a comparison between the rates on canned goods in Texas, and Central Freight Association Territory. Pages E-1 and E-2 reflect comparisons for distances up to 800 miles. The Texas railroads have found it necessary to meet the requirements of the canning industry by establishing a large number of special rates lower than the scale rates.

A tabulation of these special rates, their origins and [fol. 5380] destinations will be found on pages E-3, E-4 and E-5. For example, according to the tabulations on pages E-3, E-4 and E-5 there is a total of three special rates for distances between 95 and 100 miles.

There is a 5 cent spread between the 20,000 and 60,000 mileage rates. The average rate, therefore, for the mileage block 100 and over 95 page E-1 is 10 cents subject to a minimum of 60,000, and 15 cents under the 20,000 minimum. In 1939 the Texas railroads originated 130,144 tons of canned goods; the lines in the Central Eastern Region originated 990,188 tons. The percentage of the canned goods tonnage to the total tonnage handled by the Texas lines was .49 per cent; for the Central Eastern Region, .47 per cent.

The ton per mile of line in Texas was 8; for the Central Eastern Region, 41. Putting it another way, there originated in Texas canned goods tonnage amounting to 13 per cent of that which originated in the Central Eastern Region. Notwithstanding this showing, our Texas rates are considerably lower as we have shown by pages E-1 to E-5, inclusive.

Pages F-1 to F-5, inclusive, show a comparison between the Texas rates and the various rate scales which we have found in effect in Central Freight Association Territory applicable on road building materials such as sand, gravel, crushed stone and articles taking same rates. In all instances, the Texas rates are lower than the Central Freight [fol. 5381] Association rates.

Striking a general average of these scales, the Texas average rate of the Central Freight Association average rate, both single and joint, is 75 per cent. The average per cent which the Texas rates bear to the C. & E. I. scale is 48 per cent; to the Illinois Central scale, 62.5 per cent. With the exception of the Illinois rates shown on page 5, the statement was prepared for distances 300 miles and less. Generally this is the maximum distance of the scales in Central Freight Association Territory; also, the major portion of this traffic in Texas moves for distances less than 300 miles with an average weighted haul of less than 100 miles.

Pages G-1 to G-34, inclusive, show numerous rates applicable between points in Texas which are on a higher level than the rates on the same commodities in Central Freight Association Territory.

All commodities taking rates slightly higher in Texas could not be included in an exhibit of this kind, because of the enormous amount of work involved. Selections were made, however, to cover commodities which originate and move between Texas points in substantial quantities.

Beginning with page G-3 and ending with page G-34 we have shown that the average rates in Texas on these commodities for the distances shown range from 95.9 per cent to 120.8 per cent of the Central Freight Association rates. [fol. 5382] Pages H-1 to H-6, inclusive, is an analysis of traffic originated on all railroads of Texas and on Class I

Railroads in the Central Eastern Region. Pages H-1 and H-2 is a statement arranged by commodity groups as they appear in the 49th Annual Report of the Railroad Commission of Texas covering the calendar year of 1939. This arrangement of commodity grouping is similar to I.C.C. Statement 40100. The Central Eastern Region is used because it generally includes Central Freight Association Territory. It has not been possible for me to divorce data for the Central Freight Association from the Central Eastern Region Report.

Page H-3 shows commodities originating and moving in Texas each of which produces more than 1 per cent of the total Texas tonnage; the per cent which such commodities are of the total tonnage in the Central Eastern Region; also, tons per mile of road in Texas and the Central Eastern Region.

For example, wheat represents 5.53 per cent of the total tonnage originated by the Texas railroads; it represents .76 per cent of the total tonnage originated in the Central Eastern Region; 90 tons per mile originated in Texas, while 68 tons per mile originated in the Central Eastern Region.

Page H-4 shows a list of commodities each of which produces more than 1 per cent of the total tonnage originated in the Central Eastern Region, and the per cent which such commodities are of the total tonnage originated in [fol. 5383] Texas and the tons per mile of road. This page also shows that the commodities producing more than 1 per cent of the total tonnage in the Central Eastern Region amount to 90.04 per cent, while the same commodities in Texas amounted to 63.97 per cent of the total.

Page- H-5 and H-6 show the relative importance of a partial list of commodities on which rates in Texas are lower than or higher than rates in Central Freight Association Territory. There is also shown on page H-5 the average per cent which the Texas rate is of the average Central Freight Association rate and the per cent of the total tonnage which that commodity bears to the total tonnage originating in Texas and the Central Eastern Region.

For example, on wheat, flour and mill products the Texas rate is 94 per cent of the Central Freight Association rate. These commodities represent 8.79 per cent of the total Texas tonnage; in the Central Eastern Region 1.87 per cent of the total.

At the bottom of the page it is shown that the average Texas rates are 80.4 per cent of the Central Freight Association average rates, on 48.99 per cent of the total Texas tonnage originated.

On page H-6 are listed, first, the commodities which are subject to higher rates in Texas than in Central Freight Association Territory. For example, near the center of the [fol. 5384] tabulation refined petroleum oils are subject to rates in Texas which are on an average 107.3 per cent of the rates in Central Freight Association Territory. These commodities represent 21.22 per cent of the total Texas tonnage, while they represent in the Central Eastern Region 5.06 per cent of the total.

This tabulation shows also that the average per cent Texas rates is 109.7 per cent of the C.F.A. average on 34.53 per cent of the commodities making up the total tonnage originating in Texas. This same group of commodities represent 65.63 per cent of the total tonnage originated in the Central Eastern Region.

Striking an average, as shown on the lower half of page H-6, we contend that on 83.52 per cent of the total tonnage originating on the Texas lines as reported by the Railroad Commission of Texas for the calendar year of 1939 the average per cent which the Texas rates are of Central Freight Association rates is 95 per cent.

If it were possible to rate the remaining 16.48 per cent of the total Texas tonnage for the year 1939, I am confident that there would be no increase in the average Texas percentage of the Central Freight Association rates; that is, I believe the average percentage for the Texas lines would still remain under the 100 per cent mark. I am confident this would be the situation, because there are many com- [fol. 5385] modities taking lower rates in Texas which cannot be included in the tabulation we have made—pages H-1 to H-6, inclusive.

My views are further supported by pages C-1 to C-41, inclusive, which contain many rates lower in Texas than they are in Central Freight Association Territory, which cannot be applied to the statistical tonnage report issued by the Railroad Commission of Texas because of its many consolidations.

When I prepared my exhibit in expectancy of testing at the Indianapolis hearing, the report of the Railroad Commission of Texas for the calendar year of 1940 was not available. I have since obtained a copy which is styled the 50th Annual Report of the Railroad Commission of Texas for the year ended December 31, 1940.

Using the statistical data in this report and Statement No. 41100 of the Interstate Commerce Commission for the year 1940, I have prepared Pages I-1 and I-2.

Page I-1 shows that on 48.64 per cent of the total Texas tonnage originated, the Texas rates were 80.4 per cent of the Central Freight Association rates.

The upper portion of page I-2 shows that on 33.67 per cent of the total Texas tonnage the average Texas rates are 109.7 per cent of the Central Freight Association. The lower portion of page I-2 shows that the Texas rates are 95 per cent of the Central Freight Association rates on 82.31 per cent of the total Texas tonnage originated. It is [fol. 5386] interesting to compare pages H-5 and H-6, which cover the calendar year 1939, with pages I-1 and I-2, which cover the calendar year of 1940. These statements show that there was little variation in the tonnage originated in Texas and the Central Eastern Region for the two years in so far as the commodities which I have treated are concerned.

Pages J-1 to J-15, inclusive, show comparisons of rates on articles comprising the Grocery, Hardware and Drug Mixtures in Texas and the rates on the same articles in C. F. A. territory.

Column 1 reflects the rates applicable on the grocery mixture as explained on pages J-3 to J-5 inclusive; column 2 reflects the rates on the hardware mixture which is explained on pages J-6 to J-8, inclusive; column 3 reflects the rates under the Drug Mixture which is explained on pages J-10 to J-15, inclusive. There are no grocery and hardware mixtures in C. F. A. Territory, but there is a drug mixture which is applicable on a wide variety of articles, and the rates are shown under the last column, pages J-1 and J-2.

The purpose of this exhibit is to give force to our contention and previous testimony to the effect that there is very little tonnage moving in our section of the country under class rates.

The exhibit shows that for 130 miles and less our Texas grocery and hardware mixtures rates are lower than C. F. A. [fol. 5387] third class; for 260 miles and over 130 miles the grocery and hardware mixtures are lower than C. F. A. second class; for 350 and over 260 miles they are lower than C. F. A. first class.

The grocery mixture rates are subject to a minimum rate of 500 pounds, while the Hardware Mixture carries a minimum of 300 pounds. The articles included in these mixtures are rated in the Classification third class and higher, many of them subject to first class and higher. Our drug mixture rates are somewhat higher than the rates in the C.F.A. Territory, but they are considerably below the Texas class rates. The Texas mixture rates shown on this exhibit are in keeping with similar rates in effect in the southwest.

Chmn. Alldredge: May I ask one question?

Mr. Barron: Yes, indeed.

Chmn. Alldredge: Did you cover the whole part of these rates or just select certain commodities?

The Witness: We covered the principal moving commodities in Texas.

Chmn. Alldredge: I notice goats in here. Is that a big moving commodity in Texas?

The Witness. It is indeed, sir.

Chmn. Alldredge: So you used your own judgment as to what you selected; is that right?

The Witness: We were guided by the volume of the movement. That was the outstanding reason for it. [fol. 5388] In other words, we selected commodities which moved in considerable volume under the intrastate rates.

Chmn. Alldredge: I just wanted to get the basis. It does not attempt to compare all the rates.

The Witness: No, sir.

Commr. Aitchison: I suggest you read Rule 84-A before you put another exhibit of this size up to us.

Mr. Barron: I will agree with you that it does not conform to the rule.

By Mr. Barron:

Q. Mr. Roberts, the rates that you have shown intrastate within Texas, do they reflect the 148 increases?

A. They do not, for the reason that this exhibit was prepared for presentation if possible at the Indianapolis hearing. The Ex Parte 148 rates were not in effect in Texas at that time and did not take effect until March 1, 1943.

Q. The rates shown as applicable within C.F.A. territory, do they reflect the 148 increases?

A. They do with the exception of Exhibit 223. That exhibit was prepared by me personally last week, and the rates shown therein are exclusive of Ex Parte 148 increases in both territories.

Mr. Barron: I offer Exhibits 222 and 223 in evidence.

Commr. Aitchison: Without objection they will be received.

(Exhibits 222 and 223, Witness Roberts, received in evidence.)

[fol. 5389] Mr. Barron: You may cross-examine.

Commr. McConnaughey: Can you tell me, in the State of Texas and your part of the country, what percentage of total tonnage moves under class rates?

The Witness: No, sir, I cannot. I can tell you what percentage moves under less than carload rates, and it is less than 1.5 per cent of the total tonnage.

Cross-examination.

By Mr. Bee:

Q. Mr. Roberts, in line with that answer, is not one of the reasons why there is not a greater percentage of the traffic in Texas moving under less than carload rates because the carriers have seen fit to make commodity rates on less than carload traffic to meet truck competition?

A. That is true, truck competition and commercial competition, I should say.

Q. Turning to the first section of your Exhibit 222, there — have compared the Column 100 rate in C.F.A. Territory and in Texas showing at each mileage block of the comparison the percentage relationship that the Texas rate is of the C.F.A. rates.

Just for a quick comparison, at 100 miles you show that the relationship of Texas to C.F.A. is 131.9.

The reverse relationship, if you will accept my figures, Mr. Roberts, would be 75.85, that is, that the C.F.A. is 75.85 per cent of the Texas rate.

[fol. 5390] A. If you have figured it out, I will accept your calculation.

Q. At 200 miles it would be approximately 70 per cent, and at 300 miles, approximately 70 per cent.

Taking in the second section, or B, is it not a fact that in nearly every instance the classification rate in Texas is higher than the classification rating in C.F.A.?

A. It is true in some instances. The exhibit speaks for itself, Mr. Bee.

Q. Well, on the first page of that exhibit it appears from the count I have made that of 25 items listed, 11 of them have the same rating in Texas and in C.F.A. classification basis, while 14 of them have a higher rating in Texas than they do in C.F.A.

A. I haven't counted them. I don't know whether that is correct or not, Mr. Bee.

Commr. Aitchison: What deduction do you want us to draw from this mass of figures?

The Witness: I am trying to show that our rate level in Texas, Mr. Chairman, is not as high as the rate level in the Central Freight Association Territory.

Mr. Bee: Mr. Chairman, the result is shown on page 2 of the statement, the tenth line from the bottom in the middle of the page, "But I do contend that they demonstrate that any general statement which has been made to the effect that the rates in Texas are higher than Central Freight [fol. 5391] Association rates is not correct."

I think that is the trend of the exhibit and the trend of the testimony, and it is upon that basis I am attempting to cross-examine the witness.

Chmn. Alldredge: Is it the function of a witness to contend?

Mr. Bee: Well, they have been doing it throughout this hearing, so I was not going to object to Mr. Robert's statement.

By Mr. Bee:

Q. Has not the fact that the classification basis in Texas is higher than the classification basis in C.F.A. been the principal reason why the rates have been reduced in Texas?

A. I do not understand that is correct.

Q. Then what do you think has caused the material reduction in Texas as shown on pages 1 to 13 of your Section B exhibit?

The Witness: State the question again.

Q. Will you please state why the material reductions have been made in the ratings as shown on pages 1 to 13 of the B section of your Exhibit 222?

A. I couldn't undertake to explain that here.

Q. Under Section C to H, inclusive, you compare the rates by commodities, do you not?

A. You are speaking of C series?

Q. C to G, inclusive, I think it is.

A. That is correct, C to G, inclusive.

[fol. 5392] Q. And you have given throughout your comparisons the same weight to a shipment moving five miles as a shipment moving 900 miles, have you not?

A. We have endeavored to make an average of the rates for the distances up to 900 miles.

Q. And when you came to the so-called building material rates, in order to get that comparison, you moved a shipment 300 miles as a maximum in the State of Texas, but you used the rates in Illinois for distances of 400 and 500 miles, and compared the total of 400 and 500 miles to the 300 mile total in Texas, did you not?

A. I don't think so. That is a rather long question.

Q. Will you please refer to page F-5 and see if you did not do that.

A. The exhibit with respect to the road building materials, pages F-1 to F-5, inclusive, was made for the same purpose that comparisons were made on other commodities, and it was prepared separately for the reason that there are many scales in C.F.A. territory, whereas we have only one scale in Texas.

Q. Will you look on page F-3, if you please, Mr. Roberts, and state whether or not the maximum distance used in Texas was 300 miles.

A. That is correct.

Q. Now, then, look on page F-5 and see whether or not in [fol. 5393] Illinois you used 400 miles under the C. and E. I. scale, and 500 miles under the Illinois Central scale, and compared the total of 400 miles and 500 miles respectively with 300 miles in Texas.

A. The analysis is on page 4, Mr. Bee, and it is a general average of the rates for the distances covered by the exhibit.

Q. Where is there any analysis on page 4 of the C. and E. I. scale and the I.C. scale?

A. It is not, but that is touched upon in my prepared statement.

Commr. Aitchison: What is the I.C. scale?

Mr. Bee: Illinois Central.

By Mr. Bee:

Q. Isn't it actually shown on page 5 and don't you show that the total of the C. and E. I. scale is 12,444? And that that divided by the number of rates used would produce an average rate of 204, and then did you not take the average rate of 98.7 for Texas, shown on page 4, and then show the Commission that the Texas rate is 48 per cent of that?

A. Yes, I believe that is correct.

Q. And you compared 300 miles aggregated in Texas with 400 and 500 miles aggregated in Illinois.

A. The actual haul in Texas is considerably less than 300 miles. That is probably the reason that was done.

Q. You mean you would aggregate the rates for 500 miles [fol. 5394] by blocks and take the total of that and aggregate them for 300 miles in Texas by blocks, and then compare those two rates to see what percentage the Texas rate is?

A. A proper comparison, as you have just explained it, would be to take distance for distance.

Q. Yes, sir. Did you in getting the percentages which are shown at the bottom of each page use an average of averages to secure those percentages, or how did you secure them?

A. What do you mean by at the bottom of each page?

Q. Taking the bottom of page C-40, if you please, in which you show that the total of the Texas commodity scale on crude oil is $3.025; that the total of the C.F.A. rates on crude oil is $3, and you show that the Texas rates are 99.7 per cent.

A. Yes.

Q. Can you tell me how you get that 99.7 per cent without taking the average of averages of the rates shown on the right hand column?

A. That is what we did. We took the average of the averages.

Q. Is that the proper way to secure the relationship of those rates, or would you take the $3.025 as a total into the $3 as a total to see what the rates would be?

A. We have done that in each instance.

Q. Let's see if you have. 302.5 is more than 300, isn't it?

A. What do you mean by two and a half?

Q. Don't you show the rate is $3.025 in Texas, the total of [fol. 5395] the rates?

A. Yes.

Q. And you show the total rates in C.F.A. as $3?

A. Yes.

Q. Isn't $3.025 more than $3?

A. It is.

Q. Could it be 99.7 per cent?

A. No, that figure is wrong.

Q. Didn't you take and add up these percentages on the right hand side and divide them in order to get your average?

A. That is the average per cent. That is what happened, Mr. Bee.

Q. Let's go to the last two pages of the Exhibit 222. You have not attempted to weight the movement—this is pages I-1, I suppose it is, the last two pages, you have not attempted to weight the average movement of these commodities, have you?

A. No.

Q. You have simply taken the aggregate of the scales that you have used.

A. That is correct.

Q. And one of the heavy movements is grain, which formed 8.03 per cent, or wheat, of the Texas total tonnage, and 2.57 per cent on coarse grains.

A. That is correct.

[fol. 5396] Q. And those scales in Texas are what is known as the bobtailed scales, are they not?

A. Yes.

Q. They run out to a distance of 350 miles and blanket for all distances beyond.

A. That is correct.

Q. And those matters are now before this Commission in a 13th Section proceeding?

A. Yes.

Q. By the use of your percentages you have assumed that there is an average distance of all commodities moved in Texas as are moved in C.F.A. territory.

A. I am assuming that would be the result if that was the average distance in both territories.

Mr. Bee: Thank you. That is all.

Chmn. Alldredge: May I ask you one further question? The only comparison of rates on citrus fruits moving from some Texas producing point I suppose to its destination is with local rates within Central Freight Association Territory. Do you think that comparison has any probative value?

The Witness: It is for comparative purposes only. It represents the going rates in both groups of both territories.

Chmn. Alldredge: Do you think there would be any [fol. 5397] movement of citrus fruits of carloads locally in C.F.A.?

The Witness: I am quite sure there would not be any to speak of.

Commr. Aitchison: This item is fruits and vegetables.

Chmn. Alldredge: He has one on citrus fruits.

Mr. Bee: Page C-32. That same comparison is true as to cotton and as to cottonseed meal and cake and bulls, and other commodities that are peculiar to either of the two territories, is it not, Mr. Roberts?

The Witness: Yes, we are not attempting to say to this Commission that these commodities that are included in this exhibit move freely in the C.F.A. territory.

Mr. Barron: That is originate in the C.F.A. territory.

The Witness: That is right.

By Mr. Bee:

Q. And you made a separate comparison on sheet—we will take a couple—take hogs and calves, and you took stone rates and feeder livestock rates, as well as the edible livestock rates; you took them all.

A. Because we have all those commodities and they move freely in Texas.

Q. And you have not in this Exhibit tried to indicate whether the rates were fixed by the Texas Commission or whether they were voluntarily fixed by the railroads.

Mr. Barron: Intrastate?

Mr. Bee: Yes.

[fol. 5398] Mr. Barron: You know we can't voluntarily fix rates in Texas.

Mr. Bee: I don't know anything of the kind.

The Witness: That is correct.

Mr. Barron: That is correct.

By Mr. Bee:

Q. Let's see if that is correct. In the sugar case you decided the railroads should reduce the rates in Texas, did you not?

A. That was part of a general reduction, as you well know.

Q. On sugar alone?

A. Yes.

Q. And there was prepared in your office on the 18th day of September a petition to the Texas Commission to permit you to reduce the rates on sugar throughout the state. You sent that to Washington and then there was class parity upon that and they gave you the authority on the 19th and you then called it an order of the Texas Commission, didn't you?

A. Yes.

Q. And that is the way all your rates were reduced in Texas.

A. That is correct, but no rate is in effect in Texas until it is approved by the Railroad Commission of that state.

Chmn. Alldredge: Somebody told me it had to be prescribed by the Texas Commission.

The Witness: That is true.

Mr. Bee: That is true. They fix the rates.

[fol. 5399] Commr. Aitchison: You are excused.

(Witness excused.)

Commr. Aitchison: We will suspend until 2 o'clock.

(Thereupon at 12:30 o'clock p.m., a recess was taken until 2 o'clock p.m., the same day.)

[fol. 5400] Afternoon Session

Commr. Aitchison: Anything further on behalf of Southwestern Railroads?

Mr. Hughes: Nothing further.

Commr. Aitchison: Possibly we had better ask Dr. Edwards to come on and finish up this phase.

Dr. Ford K. Edwards resumed the stand and testified further as follows:

Direct examination (continued)

By Mr. Smelker:

Q. Dr. Edwards, the two-page statement headed "Data Furnished in Answer to a Request of Mr. Grubb of the Louisville & Nashville Railroad," that is in answer to the requests he made upon your recent cross examination, is that right?

A. Yes, sir.

Q. That has been distributed and may be copied into the record, I understand?

A. Yes, sir.

Mr. Grubbs: That is agreeable with me.

(Data Furnished by Mr. Ford K. Edwards in answer to a request of Mr. Grubbs of the Louisville & Nashville RR.)

"Question No. 1: Refer to Exhibit 196 and the table headed 'Fully Distributed Costs' appearing at the top of page 4. A computation of the fully distributed costs, for the East, including New England and Pocahontas Territory [fol. 5401] would show the index of cost based on the assumed average loads to be 95. The index of costs based on the actual average loads would also be 95.

"Question No. 2: See Exhibit 196, page 5, data showing a comparison between the East, excluding Pocahontas Territory, and the South, excluding Kentucky.

"Mr. Grubbs has requested that we check his computations based on my Exhibit 195 showing the costs for the South, excluding the State of Kentucky, to be 108.34 per cent of the costs for the East, including New England and the Pocahontas Territory.

"These costs are based upon a box carload of 25 tons and a gondola carload of 50 tons hauled a distance of 300 miles, equal weight being given to the movement in each type of equipment.

"Mr. Grubbs has also requested that we check his computations based on my Exhibit 195 showing the costs for the South, excluding Kentucky, to be 109.27 per cent of the cost for the East, including New England, Pocahontas and Kentucky.

"These computations are similarly based on a box carload of 25 tons and a gondola load of 50 tons hauled a distance of 300 miles equal weight being given to each. These computations are correct.

"Question No. 3: Mr. Grubbs requested that we show [fol. 5402] our computation of the tons bridging the South consisting of petroleum and petroleum products. These figures may be computed directly from my Exhibit 195, Table 3, page 13, by subtracting the count of revenue tons excluding bridge traffic from the count of tons including bridge traffic.

"See columns (8) and (9). I have made such computations for Commodity Classes Nos. 380, 450, and 451, and find that the count of bridge traffic computed for these commodities constitutes 2,305,195 tons, or 1.5 per cent of the total count of tons in the South.

"I should like to make the additional statement that the amount by which we expanded the petroleum tonnage to account for those tons not included in the statement of tons originated or terminated as shown in Statement No. 40100 constitutes 1.9 per cent of my total count of all tons carried in the Eastern District, Southern District, 2.8 per cent of my total count of all tons carried in the Southern District, and 3.7 per cent of my total count of all tons carried in the Western District.

"These percentages are based upon a comparison of the figures shown in Freight Commodity Statistics, Statement No. 40100, and the figures shown in my Exhibit 195, page 13, for Commodity Classes Nos. 360, 450, and 451.

"Question No. 4: Refer to Exhibit No. 196, page 33, item 38. The names of the Class I railroads referred to are as follows:

[fol. 5403] "Eastern District:

Baltimore & Ohio R. R.
Boston & Maine R. R.
Chicago & Eastern Illinois R. R.
Erie R. R.

New York Central R. R.
New York, New Haven & Hartford R. R.
Pennsylvania R. R.
Pere Marquette Ry.

"Southern District:

Atlantic Coast Line R. R.
Cincinnati, New Orleans & Texas Pacific Ry.
Florida East Coast Ry.
Georgia Southern & Florida Ry.
Illinois Central R. R.
Louisville & Nashville R. R.
Norfolk & Western Ry.
Seaboard Air Line Ry.
Southern Ry.
Yazoo & Mississippi Valley R. R.

"Western District:

Atchison, Topeka & Santa Fe Ry.
Chicago & North Western Ry.
Chicago, Burlington & Quincy R. R.
Chicago, Great Western Ry.
[fol. 5404] Chicago, Milwaukee, St. Paul & Pacific R. R.
Chicago, Rock Island & Pacific Ry.
Denver & Rio Grande Western R. R.
Great Northern Ry.
Missouri-Kansas-Texas R. R.
Missouri Pacific R. R.
Northern Pacific Ry.
St. Louis-San Francisco Ry.
St. Louis Southwestern Ry.
Southern Pacific.
Texas & New Orleans R. R.
Texas & Pacific Ry.
Union Pacific R. R.
Western Pacific R. R.

Mr. Smelker: Now, the one-page statement that has been distributed, I understand there are no objections to that, no objection to its being copied into the record.

Commr. Aitchison: If there is no objection, that will be done.

(Statement of Mr. Ford K. Edwards.)

"I should like to refer to Mr. Heywood's Exhibit No. 215, page 6, wherein he shows the ratio of Southern Region cost to Eastern District cost, including the Pocahontas Region, to be .982. These figures are based on the use of the cost data appearing in my Exhibit 3, Table 27 and exclude con- [fol. 5405] sideration of l. c. l. traffic.

"I have checked Mr. Heywood's exhibit and find nothing wrong with his computations. However, I should like to point out that Mr. Kennedy in Exhibit 181 made comparisons which were based not only on the use of cost data from my Exhibit 3 but also on the use of cost data from my Exhibit 13, including both carload and less-carload traffic.

"For this reason I have re-worked Mr. Heywood's exhibit to show the results based on the use of the cost data in my Exhibit 13 and including both carload and less-carload traffic. The effect on Mr. Heywood's figures is very slight. The figure of .982 appearing at the foot of page 6 of Exhibit 215 is changed to .994.

"I should like to refer to Mr. Heywood's Exhibit 215, page 7, showing the ratio of Southern Region cost to Eastern District cost, excluding Pocahontas Region, to be .913. These figures are based on the use of my Exhibit 3, Table 87.

"I should like to point out that had the cost data in my Exhibit 13 been used and both carload and less-carload traffic included, the figure of .913 would change to .919."

Mr. Smelker: Cross examine.

Cross-examination.

[fol. 5406] By Mr. Norman:

Q. Just for my information, at whose request did you make this recalculation of Mr. Heywood's exhibits?

A. I did not make that at anyone's request.

Q. That was done on your own motion?

A. Yes; that is right.

Mr. Norman: That is all.

Commr. Aitchison: You are excused.

(Witness excused.)

Commr. Aitchison: We might as well finish up the Southern shippers.

Mr. Widell, are you ready?

C. E. **Widell** resumed the stand and testified further as follows:

Commr. Aitchison: You have been sworn, haven't you, in this case?

The Witness: Yes, Mr. Chairman. I testified at Columbus.

Direct examination.

The Witness: I testified in these proceedings at Columbus, Ohio, during November, 1942.

I shall be very brief in view of the desire of every one to get away, and perhaps take much less time than I had requested.

I would like to have the record show, in view of what has [fol. 5407] been testified regarding segregation of commodities and traffic, either class rate traffic or such traffic as is subject to exceptions, and straight commodity rates, and to state that in our segregation of the 1941 tonnage in the South, on which the general rate levels are lower than in the North, excluding coal and coke, there was over 42 per cent—to be exact, 42.3 per cent—of this so-called low-grade, heavy-loading commodities.

That represents such a substantial part of the Southern carriers' revenues and tonnage, that due consideration must be given to this segregation of commodities, at least, from a classification standpoint.

Today the rates in the South are such that if we had uniform rate scales, that is, Class rate scales, and if we had a classification set up to correlate with the present levels in the South as compared with in the North, we would have to assign at least 12 major basic commodities in the South to a lower level within the South than within the North.

This gave rise to further tests in connection with the testimony at this hearing——

Commr. Aitchison (Interposing): Are you referring to some exhibit that is in the case, Mr. Widell?

The Witness: Yes. I am referring to the testimony, probably more the general testimony, now, of—Well, of all the witnesses. They all had something to say, especially Mr. Hart, and I just commented in passing that uniformity [fol. 5408] *as* such as we have heard about in this hearing would be a most difficult thing, because it would destroy the authority and the jurisdiction of our State Commissions to a great extent.

At least, that would be the practical effect.

The differences in rates within each Territory are great because the various States have different rate bases. All of this is a healthy condition, we ought not — destroy it, so that even if we could start out with uniformity in a short time we would have departed from it in response to local conditions, State or Regional.

Commr. McConnaughy: Could not the States make exceptions, even though you attempted uniformity?

The Witness: Yes, but it goes to the point, then, of where we would end up with our theory of uniformity.

We would not have uniformity.

Witness Henderson indicated quite plainly that there had been no industrial opposition to the general Class Rate investigation in the South prior to April, 1940.

I have before me the Southern Traffic League Circular No. 550-A, reporting the meeting of the Southern Traffic League at Charlotte, North Carolina, on March 15, 1939.

That meeting was illustrious because at that meeting was adopted a recommendation to request this Commission to institute the proceeding which is here under hearing.

Commr. Aitchison: When was that?

[fol. 5409] The Witness: March 15, 1939, as a result of which the Commission acted upon those recommendations and instituted this proceeding.

In that meeting, which was composed of mixed industrial men, Chambers of Commerce, and so on, there were 21 who voted.

The report says the question was put to a vote, and the recommendation of the Committee carried by 16 to 5, but the report shows that there had been considerable discussion and strong opposition to the whole proceeding on the ground that, as we have heard at this hearing, the Southern carriers could not stand a substantial reduction in the Class Rates without making up the lost revenue through increases in commodity rates.

Mr. Henderson referred to truck bodies built in Nashville, and, as I understood him, he left the impression that the outbound movement, consisting of driving away the trucks finished, was perhaps influenced by the rate level on these finished trucks from Nashville to Metuchen, New Jersey.

This is war material. The order came from the Contract Ordnance Department, Procurement Division, at Metuchen, New Jersey. Whether the trucks ever reached Metuchen, New Jersey, or not, of course only the War Department knows.

Phillips & Buttorf had nothing to do with the outbound movement. I say that because I happened to have something to do with the very beginning of this in the assembly [fol. 5410] of raw materials, and as I say, the War Department character of the movement is such that it is impossible to divulge all of the sources, but I make the definite statement that if it was a question of freight rates from Nashville, then only the Procurement Division at Metuchen, New Jersey, can say that.

We understood that it had nothing to do with it; in fact, we don't know where the trucks have gone to.

Chmn. Alldredge: May I ask you something there?

Does the War Department, however, in taking bids specify some point of delivery and evaluate the bids on a delivered price?

The Witness: In this case, Mr. Commissioner, the bid was "delivered at Nashville", just a finished truck f.o.b. Nashville.

Chmn. Alldredge: I understood him to say that that was changed; it was first set somewhere else and then changed to f.o.b. Nashville.

The Witness: There may have been some negotiations, of course, that I don't know about, but I do have definite knowledge of this, that when Phillips & Buttorf are finished with the body which they assemble and put on the chassis, that they notify the Procurement Division at Metuchen, and tell them how many they have ready, and the War Department takes over.

Chmn. Alldredge: The custom is generally to take bids on a delivered basis at some point; isn't that true?

[fol. 5411] The Witness: I reckon it is. I know of my own personal knowledge of some, and then again, on other contracts, it is at the factory door, practically. I have another Government War Company, as it were, on my hands, too, at Lewisburg, Tennessee, so that, of course, I know what our practices are with respect to those contracts.

I want to make reference to Witness McDonald's statement about the Southern States Industrial Council and say this: Positively and definitely it is not railroad-controlled, but in the South we do consider the railroads as part of Industry.

We have some railroads as members of the Council. We are proud to have them.

Among them is Mr. Ernest Norris who, I think, is one of the directors; and for years Mr. Fitzgerald Hall, President of the Nashville—Chattanooga & St. Louis Railway, has been a staunch friend; but so far as the direction on their part or their influence as such in the affairs of the Council is concerned, one might say it is nil, because the Council is composed of executives of Southern industries.

No one lower in rank than vice-president or the top executive officer may exercise any voice whatever in the Council affairs.

I have been with the Council, and I, of course, speak from knowledge.

The resolution that Witness McDonald spoke of as from [fol. 5412] the meeting at which appeared Mr. J. O. Hendley and Mr. Backman, of Atlanta, was really not a resolution.

The two gentlemen appeared at that meeting. It was a meeting of the Executive Committee of the Council. I was there. I came in from Nebraska from the University Conference.

The Southern Governors had asked for the support of the Council in this proceeding. Mr. Hendley was heard. Mr. Bachman was heard. They are held in high esteem; their counsel is valuable; they were given every consideration, but the decision was not to support the Southern Governors in this proceeding.

Tyre Taylor, Executive Vice-President at that time, was instructed to advise the Southern Governors of the general transportation policy of the Council, so that what was read in the record by Witness McDonald is nothing more nor less than Paragraph 6 of the published Declaration of Policy issued by the Southern States Industrial Council, and is now a matter of record.

The Council went definitely on record at the Columbus hearing in November, 1942, a statement of which is a part of the record.

At the Birmingham Conference, in December 1941, referred to by Witness McDonald, there was never intended to be any resolution coming out of that conference. It was an open forum designed merely for the airing of the views [fol. 5413] of Southern interests in respect of this proceeding, and we were proud to have the Honorable Walter McDonald with us. His views were printed in the proceedings, and given wide distribution, including all of the exhibits that he had in connection with his statements, and we should be proud to have him with us again.

Mr. Hart's Exhibit No. 220, Sheet No. 1, "Comparison of Mileage Scales on Logs in Southern and Official Territories," his first scale is under the heading of "Southern Scale".

That is not the scale of rates that apply generally on logs in the South. I am sure that Atlanta, Georgia,——

Mr. Norman (Interposing): He didn't say so.

The Witness: He compares it with the Chicago-Northwestern Railway scale, with the Boston & Maine scale, and with the Maine-Central scale. I assume his purpose was merely to show the pattern of rates, as he calls it. I am not quite sure that I know what he means by the "pattern of rates," but I will say this, that what are used in the South and applied generally on logs are the so-called net transit scales, which are approximately one-half of the scales shown under the heading "Southern Scales".

On Sheet No. 2, Table A, comparison of mileage scales on lumber, I want to say this, to make the exhibit definitely clear, that the bulk of the movement of lumber in Southern Territories is 400 miles and under.

[fol. 5414] That also answers, to some extent, the showing on Sheet No. 3, where the long-haul rates are set out from the Mississippi Valley points, and from Montgomery and Dothan, Alabama, to Goldsboro and Winston-Salem, North Carolina.

I don't mean that they do not draw lumber from the Valley. They do. But even the North Carolina furniture factories draw the bulk of their raw materials closer to home.

On Sheet 2, Table B, scrap iron, just to make it clear as to what rates actually moved the tonnage, the bulk of the traffic in scrap iron in the South moves on the 80,000-pound rates, and the bulk of the scrap iron traffic within Southern Territory moves for distances of 500 miles, and less.

Commr. Aitchison: These movements that you have just been speaking about, Mr. Widell, are within the Southern Territory?

The Witness: Within the Southern Territory.

Commr. Aitchison: And not other Territory?

The Witness: No. There is some scrap iron moving from the South today to Official Territory, but it is contrary to the usual.

Commr. Aitchison: Plenty of lumber moves from the South?

The Witness: Yes, sir; lumber moves in heavy volume from the South to the North, and generally speaking, the level of our north-bound lumber rates is lower, mile for mile, than lumber rates within Official Territory.

[fol. 5415] Chmn. Alldredge: We have had quite a number of scrap iron cases here involving movement from Carolina Territory, Tennessee, and Kentucky, up in Official Territory.

The Witness: Yes, what might be termed, Mr. Commissioner, the Border Territory; but from the Deep South, generally, there is very little movement.

On Sheet 5, just taking one commodity, the shipper designation letter "M", third from the bottom, I notice that Witness Hart shows prevailing rate levels as column 55 within the South. That is the classification rating on the articles set out under the description, but we have concluded commodity rate adjustments from two very important tank producing points: Chattanooga and Birmingham; to Ohio and Mississippi River crossings; St. Louis, Missouri; and Chicago and Milwaukee; and, in fact, all of what is known as Illinois Freight Association Territory; and also to the Border Territory East of Cincinnati, including the Virginia cities and including Washington, D. C.

I had something to do with that adjustment, and our investigation indicated that there was little movement or probability of movement of tanks of this description, and also tanks thinner than No. 16 gauge, which we included in our Commodity Rate Adjustment to destinations in strictly "Official Territory," that is, CFA Trunk Line and New England.

The industry was of such a nature that it was just going absolutely contrary to the strong drift of the current, but [fol. 5416] there is and has been, and we, of course, assume, will be in the future a movement from these two important Southern points to all of the territory to which we have obtained rates on both carloads and less-carloads, mile for mile, the same as within Official Territory, except that to Illinois Freight Association Territory the rates were made not quite mile for mile, but approximately 105 per cent of the Northern level.

Those rates were made subject to what we term Rule 27, and apply to all intermediates, with the result that the Ohio River and the Border Adjustments are blanketed back considerably into the South; that is, at least into Kentucky and the Northern points of Tennessee and into North Carolina.

Now, so far as concerns the movement of tanks within Southern Territory on Column 55, or Fourth Class, or No. 2 gauge, but not thinner than 16 gauge, as described in this exhibit, there would be probably some reductions in the freight charges, if our rates were lower; but the competition that Chattanooga and Birmingham meets in Southern Territory is from the tank builders along the Border, Louisville, Cincinnati, and other northern points, who come down on exactly the same level as we have in the South.

If our rates were all reduced to the Eastern Scale level, then the spread that we now have at Southern producing points as against the Northern producing points would be diminished substantially, so that relatively we would be worse off.

[fol. 5417] That completes my statement. Thank you.

Commr. Aitchison: Cross-examine.

Cross-examination.

By Mr. Norman:

Q. I want to get this thing straightened out, about the Southern States Industrial Council. Did that organization ever, by any official action, authorize you to, in their behalf, oppose the effort of the South to secure a re-adjustment of these Class Rates?

A. I don't believe I have testified that.

Q. No, but you came here and filed the statement of——

Commr. Aitchison (Interposing): Wait a minute. What is the fact?

The Witness: The fact is, Mr. Chairman, that at the Columbus hearing I made a statement for the Council on instructions from the officers.

By Mr. Norman:

Q. What officers?

A. Of the Council. You have seen that statement.

Q. Signed by one man, Mr. Barr, and the statement itself does not say that they oppose this proceeding.

A. There is a letter that is addressed to me by the Secretary of the Southern States Industrial Council. I made Mr. Barr's statement my own, as expressing the views of the Council in the proceeding. That is the only extent to which the Council has definitely stated its position in this proceeding.

[fol. 5418] Q. And only through the Chairman of the Committee, and not by any action of its Board of Directors?

A. Mr. Norman, if you go behind the Secretary's Directions to me,——

Q. (Interposing:) I am going behind it.

A. —Then you will have to call in some one else, because I am sure the Secretary would not be authorized by himself, and the Chairman of the Transportation Committee——

Commr. Aitchison (Interposing): What you mean to say is that your direction came from the Secretary of the Council?

The Witness: Who has authority to act.

Commr. Aitchison: You can say "Yes".

By Mr. Norman:

Q. Has there ever been any action by the Board?

Commr. Aitchison: Is that right? Let me get an answer to this.

Mr. Norman: I thought you had finished.

Commr. Aitchison: Your authority came in the shape of a direction to you, signed by the Secretary of the Council, as I understand you?

The Witness: That is correct, sir.

Commr. Aitchison: All right, now, Mr. Norman.

By Mr. Norman:

Q. And he simply directed you to present the statement which you did present, prepared by Mr. Barr?

A. May I read this in the record?

[fol. 5419] Commr. Aitchison: If it is in writing, you had better read it into the record.

The Witness: Southern States Industrial Council letterhead, 1103-1111 Stahlman Building, Nashville, Tennessee.

November 12, 1942.

"Mr. C. E. Widell,
Traffic Consultant,
1100 Stahlman Building,
Nashville, Tennessee.

"Dear Mr. Widell:

"I enclose statement dated November 12, 1942, by Chairman J. U. Barr, Transportation Committee, defining position of the Southern States Industrial Council in transportation matters generally, and particularly in respect of the pending general rate investigation.

"I am instructed to request you to represent the Council, and offer this statement for the record, at the hearings before the Commission, beginning Monday, November 16th, at Columbus, Ohio.

"Yours truly, (Signed) C. C. Gilbert, Secretary."

By Mr. Norman:

Q. I now ask you whether there has ever been any action by the Board of Directors of the Southern States Industrial Council.

A. I am not a member of the Board of Directors, not a member of the Council as such.

[fol. 5420] I merely acted as their representative in presenting their views.

Q. I will ask you: Don't you know that it has been before the Board of Directors of the Council and they refused to take such action?

A. No, sir; I do not know that.

Q. You have been very active, have you not, throughout the South, and throughout these proceedings in trying to stir up objection to the position taken here by the Southern Governors Conference?

A. That might be your view of it, but it isn't mine.

Q. Haven't you gone to the extreme length within the last few days of telegraphing each one of my clients and asking them, the several Governors of the States, to withdraw from this proceeding?

A. No, sir; I didn't telegraph your clients. I telegraphed the Governor of Tennessee, my own Governor, and sent copies to the other Governors of the sovereign States of the South. They happen to be your clients, but I did not address them as your clients, but in their official capacity.

Q. But you were asking them to take action as my clients to withdraw from this case, follow your advice instead of mine; isn't that so?

A. If you have a copy of the telegram that I sent to them, you can read it.

[fol. 5421] Q. You didn't even have the decency to send me a copy of it.

A. It wasn't addressed to you.

Q. But as counsel for them, I had a right to have it.

A. I think I have a copy of it.

Q. I don't want it. I just want to know if you didn't do that.

A. Not your clients; no, sir.

Q. Aren't the Governors in those States my clients in this matter, and you were addressing them about this matter?

A. I was addressing the Governors as public officials. I certainly have a right to do that, Mr. Norman, my own Governor.

Mr. Norman: That is all.

Commr. Aitchison: Anything further with Mr. Widell?

(No response.)

You are excused.

The Witness: Thank you, sir.

(Witness excused.)

Commr. Aitchison: I think that brings us down to you, Mr. McCollester.

Charles E. Bell resumed the stand, and testified as follows:

Mr. McCollester: Mr. Chairman, Mr. Charles E. Bell has been previously sworn and testified before in this proceeding.

He has four exhibits which have been distributed, and [fol. 5422] which I would suggest we mark now.

The first exhibit is the sheet bearing in the upper right-hand corner description "Revised and Corrected Page 18 of Exhibit No. 164."

Would you have that a separate exhibit, or let it be substituted for page 18 of the original exhibit?

Commr. Aitchison: It is not deemed good practice to try to substitute. We will make this Exhibit 224.

Mr. McCollester: The next exhibit to to be marked, which will be Exhibit No. 225, I believe, it two sheets, with the caption on the first sheet, "Section 1, Number of Gross Ton-Miles Hauled in Transportation by the Chesapeake & Ohio, and Norfolk & Western Railway in CFA Territory."

(Exhibits 224 and 225, Witness Bell, marked for Identification.)

Mr. McCollester: The third exhibit, which should be No. 226, is the small single sheet, Exhibit "Statement Showing Tons of Carload Traffic," and so forth.

(Exhibit 226, Witness Bell, marked for Identification.)

Mr. McCollester: The last exhibit, which will be No. 227, is an exhibit of two sheets, with the caption "Statement Showing: Part I. Railroads in Southern and Central Regions."

(Exhibit 227, Witness Bell, marked for Identification.)

Mr. McCollester: I would say for the information of the Commission and all concerned that, with the exception of the exhibit marked No. 224, which is, as appears, a cor- [fol. 5423] rection of Exhibit No. 164, Mr. Bell's testimony and Exhibits will be directed to the testimony of Dr. Edwards.

I should like to say further, in order that our position may be clear that we are, of course, not trying to indulge in argument on the record with Dr. Edwards as to the soundness of his fundamental formula. I am reserving that for brief, but if we don't debate with him on the record it does not mean that we accept it as sound.

Direct examination.

By Mr. McCollester:

Q. Mr. Bell, have you any comment on the exhibit marked 224, which is the corrected page 18 of your exhibit No. 164?

A. Yes. After the Columbus hearing, Mr. Warren Wagner called to my attention a glaring error in page 18 of my Exhibit No. 164, and I investigated and found that my calculating machine operator in error had added together the figures for the Great Lakes Region and the Eastern District, in getting at the combined figures of the Central-Eastern and Great Lakes Regions, which I did not discover before I left for Columbus.

I have made the correction in revised and corrected page No. 18, and I have also included as information figures for the Eastern District as a whole, and I thank Mr. Wagner for calling it to my attention.

Commr. Aitchison: May I ask just one question, Mr. [fol. 5424] McCollester?

Mr. McCollester: Yes, sir.

Commr. Aitchison: You show the figures for the Eastern District and in an adjoining column you show the Central-Eastern and the Great Lakes Region, and evidently there is still one more territory there, or something to be accounted for.

The Witness: I have shown separately the New England Region.

Commr. Aitchison: And the difference represents New England?

The Witness: Yes, sir; the difference would represent New England.

By Mr. McCollester:

Q. Mr. Bell, your Exhibit No. 225 goes to the problem of the effect of including in the costs for the Eastern Territory, the operations of the Chesapeake & Ohio, and the Norfolk & Western traversing C. F. A. Territory, that is, Central Freight Association Territory, does it not?

A. In part. There are other parts of the exhibit, but that is the first part.

Q. Will you proceed to explain and comment on your Exhibit No. 225?

A. My testimony at transcript 3616 to 3622, inclusive, dealt with various territorial allocations, and are referred [fol. 5425] to in Dr. Edwards' Exhibit 196, items 2, 3, and 4.

As to the effect of including in the costs for Eastern Territory two operations of the Chesapeake & Ohio and Norfolk & Western traversing Central Freight Association Territory, that is covered by my testimony at pages 3616-3619.

I am without comparable figures similar to those shown by Dr. Edwards for the various territories covered by his exhibits, but I have prepared an exhibit indicative of the effect of including in the C. F. A. operations of the C. & O. and N. & W. in Eastern Territory No. 2.

On page 23 of Exhibit No. 196, Dr. Edwards admits that the consist of the Chesapeake & Ohio Traffic in Indiana, Ohio, and Illinois approximates that of the Chesapeake & Ohio traffic in West Virginia and Kentucky.

The same is true of the consist of Norfolk & Western traffic in Ohio, as compared with West Virginia and Eastern Kentucky.

Exhibit No. 225 is in three sections, the heading of each being self-explanatory.

I should explain, I think, how the assumed average mileages were determined.

Section 2, of page 2, Exhibit 165, shows the respective miles of Chesapeake & Ohio and Norfolk & Western in Central Freight Association Territory are 730.1 miles, and 262 miles, respectively.

[fol. 5426] Throughout Exhibit No. 225 an average mileage of 230 has been assumed for the Chesapeake & Ohio. It is 230.3 miles from Portsmouth, Ohio, to Toledo.

Practically all of the lake-billed coal moves over this line, as well as the bulk of the movement of track-delivery coal for Toledo and Michigan destinations.

The Chesapeake & Ohio distance from Cincinnati to Chicago is 285 miles.

Chicago is a heavy consumer of Pocahontas Region coal originated on the Chesapeake & Ohio, and Norfolk & Western.

Although some coal may move by junctions other than Cincinnati to Chicago and to other points in Indiana and Ohio, also to points in Western Trunk Line Territory, and although some coal for Ohio may move for shorter distances than the Toledo distance, from my own knowledge of the coal traffic I am satisfied that the average haul of the Chesapeake & Ohio in Central Freight Association Territory is not less than 230 miles; in fact, I believe it to be greater.

Lake-billed coal from the Norfolk & Western moves principally via Columbus, Ohio, which is 99 miles from North Kenova, Ohio.

The same is true of most of the Ohio coal. Considerable quantities are shipped to Cincinnati, and through Cincinnati to destinations in Indiana, Illinois, and Western Trunk Line Territory, as well as moving via Columbus.

[fol. 5427] I have arbitrarily assumed an average haul of the Norfolk & Western on all coal in Central Freight Association Territory is 33⅓ per cent greater than the haul of 99 miles from Portsmouth, Ohio, to Columbus, thus arriving at an assumed average haul of 132 miles, which I really believe to be an under-statement.

Section 1 of Exhibit No. 225 shows that the gross ton miles involved, based on the assumed average miles, would have been 27.58 per cent of the total gross ton miles for these two railroads in 1939.

These gross ton mile figures do not include traffic originated and terminated by the Chesapeake & Ohio, and Norfolk & Western in Central Freight Association Territory, nor any through or over-head traffic.

Section 2 of the exhibit shows that bituminous coal tonnage originated, constituted only 45.63 per cent of the total of all tons carried by the Chesapeake & Ohio, and Norfolk & Western.

Considerable of the remaining 54.37 per cent originated and terminated, or was handled over the portions of these lines in C. F. A. Territory.

I am without information showing the volume of carload and less-carload box car traffic transported over the C. F. A. portions of these lines.

Section 3 of the exhibit shows how, based on loading of 25 tons, that the carload unit terminal expense for the [fol. 5428] Pocahontas region was 75.59 per cent of the expense in Eastern Territory 2.

The line-haul expense was 64.06 per cent of the line-haul expense per 100 lbs. per mile in Territory 2.

The less-carload expense, based on 5 tons for Pocahontas region was 97.3 per cent, and 78 per cent, respectively, of the corresponding cost in Eastern Territory 2.

Commr. Aitchison: That is the line-haul expense, isn't it?

The Witness: Both line-haul and terminal expense, Mr. Commissioner. The terminal expense is a figure of 97 per cent and the line-haul expense would be 78 per cent.

At page 110, Item 2, Dr. Edwards' Exhibit No. 196, he refers to my testimony, transcript 3619, relating to railroads which overlap territorial boundaries. He refers to a similar point made by Witness Kennedy, Item 4, of Dr. Edwards' Exhibit No. 196.

In Item 3, Dr. Edwards says that at transcript 3621 of my testimony I raised the question as to why the Southern Railway was not asked to make certain additional separations.

All of my testimony on the territorial separations of railroads, other than the Pocahontas region railroads, appears at page 3619 through the first part of page 3622 of the record, in which I specifically mentioned railroads shown in Section 2, page 3, of my Exhibit No. 166, namely, the [fol. 5429] R. F. & P., Southern, L. & N., M. & O., and Y. & M. V.

On page 3621 I specifically referred to the Southern Railway, simply as illustrative of all the railroads I had mentioned, the operations of which had not been segregated according to rate territories.

Item 4, page 22, of Exhibit No. 196, in answer to Witness Kennedy's testimony, Dr. Edwards refers only to the L. & N., and Southern Railway. He refers also to the Chesapeake & Ohio, which I did not include in my testimony on the pages of record I have mentioned.

Dr. Edwards says that his working papers indicate that 4.3 per cent of the L. & N. miles of road, and 5.8 per cent of the Southern Railway miles of road are in Eastern Territory.

My computations show that the L. & N. mileage north of the Ohio River is 203 miles out of a total of 4,898 miles; therefore the miles north of the Ohio River are 4.14 per cent of the total.

Dr. Edwards' costs for the L. & N. are computed on the basis of 102 miles north of the Ohio River, or about 2 per cent of the total mileage.

As I testified, transcript 3620, also shown in Section 2, page 3, of Exhibit 166, Dr. Edwards has failed to include the most important mileage north of the Ohio River over the L. & N., namely, the lines from East St. Louis, Illinois, to McLeansboro, Illinois, 101 miles.

[fol. 5430] Coming to the Southern Railway, I don't know how Dr. Edwards arrived at 5.8 per cent.

Page 8, of my Exhibit No. 166 shows that the Southern railway operated 6,517 miles of road in freight service in 1939.

Section 2, page 3, of Exhibit No. 166, shows that the Southern Railway mileage in Official Teritory, is 829.3 miles, which is 12.74 per cent of its total mileage; 409.8

miles of line is between New Albany and East St. Louis and branches.

This is 6.29 per cent of Southern's total mileage.

Now, I have no means of ascertaining the proportion of the Southern Railway traffic handled over its lines in Virginia in Official Territory. I may say that the line between Washington, D. C., and Lynchburg, is a trunk line of the Southern, over which it handles its traffic between Eastern Trunk Line Territory, and the South, and is a very heavy density line.

With respect to the Southern Railway Line, north of the Ohio River, between New Albany, Indiana, and East St. Louis, Illinois, Table 3, page 17 of Dr. Edwards' Exhibit No. 10, I think it is, shows for 1940 a summary of originated and terminated tonnage of all Southern Railway System lines, including the A. G. S.; Cincinnati, New Orleans, and Texas Pacific; Georgia, Southern and Florida; New Orleans and Northeastern; and Southern Railway.

Schedule 541 A of the Annual Report of the Southern Railway for 1940, shows that, excluding other system lines, [fol. 5431] the sum of originated and terminated tonnage on this entire line was 40,419,044 tons; and in the States of Indiana and Illinois, 3,122,834 tons, which was 7.73 per cent of the total of the Southern's tonnage originated and terminated traffic.

In this connection also the fact must not be overlooked that the line between New Albany and East St. Louis is a very important line for the handling of through traffic.

I may mention also that in 1939 30.35 per cent of the total tonnage of bituminous coal originated on the Southern Railway originated on this line between New Albany and East St. Louis.

Commr. Aldridge: What percentage?

The Witness: 30.35 per cent.

One of the railroads referred to in my previous testimony is the R. F. & P. which is in Official Territory instead of being in Southern Territory, where it is allocated by Dr. Edwards.

Although this line is only 110 miles long, it is a very important bridge line over which the traffic between the East and South is funnelled, when transported by the railroads leading from Richmond, Virginia, to the South.

That is other than the Southern Railway, but even some of the Southern Railway traffic is handled over that line.

Group III of the Territorial Summary for Southern Territory—Dr. Edwards' working papers—shows 1,306,490,-587 gross ton-miles for the R. F. & P. at a cost of 1.23 mills [fol. 5432] per revenue gross ton mile, compared with the Southern territorial average of 1.62 mills.

The territorial summary also shows that there are a greater number of other group unit costs for the R. F. & P. lower than for the Southern territorial average.

I mentioned in my previous exhibit and testimony the line of the Mobile & Ohio. 151.42 miles, or 12.89 per cent of the total mileage, is north of Cairo, Illinois.

The total mileage of the M. & O., and the Gulf, Mobile & Northern, which now are operated as the Gulf, Mobile, & Ohio, is 1,981 miles.

Thus the line north of Cairo constitutes 7.64 per cent of the total mileage.

Table 3, of Dr. Edwards' Exhibit No. 10 shows that out of the total of 7,844,827 tons of freight originated and terminated by the Gulf, Mobile & Northern, 12.24 per cent originated and terminated in Illinois.

Here again the line of the Mobile & Ohio north of Cairo forms a part of one of the most important routes for the handling of traffic between the South and the territory north of the Ohio River and west of the Mississippi River, and is really almost in the nature of a bridge line operation.

Dr. Edwards stated in Exhibit No. 196, Item 4, that the inclusion of the Chesapeake & Ohio operations in Ohio, Indiana, and Illinois, would have a negligible effect on cost [fol. 5433] scales and that statement is in harmony with similar statements appearing throughout Exhibit No. 196, and his previous testimony.

In Item 4 of his answer to Witness Kennedy, Dr. Edwards says that in as much as the difference in costs between adjoining territories of the L & N, and the Southern Railway, *are* very small, it is not believed that the expense of separating out "these small segments of railway would be warranted."

He refers to that statement in connection with my testimony at pages 3619 and 3622 of the record, which related to the Southern Railway, the R F & P, and the Mobile & Ohio.

In the same answer to Witness Kennedy, Dr. Edwards says the effect of treating the portion of the Chesapeake & Ohio in Eastern Territory as being within that territory, or as an alternative, including it in the Pocahontas territory would be negligible.

In his answer, Item 3, page 111, to my testimony, transcript 3621, he says separations for the Southern Railway were not made because of statistical difficulties, and, secondly, because the amount of traffic and expense involved were of negligible proportions relative to the total for the territories; that as there proved to be little difference in relative costs for the two territories involved transfer of a small segment of one line from one territory to another would not affect the results; in other words, seemingly, Dr. Edwards shows a disposition to brush off what he [fol. 5434] considers to be small differences in costs.

While, as Dr. Edwards has contended, the allocation of some particular railroad or portion of a railroad, to a territory other than that in which the operations *take place*, may have *only* a negligible effect upon the total expense for the respective territories, my whole point has been, and is, that the aggregate of these instances is bound to have an appreciable effect.

For example, Section 2, of Exhibit No. 225, shows that the gross ton miles of the Chesapeake & Ohio, and the Norfolk & Western, within Central Freight Association territory, on coal traffic originated and terminated by these railroads in Southern West Virginia, Eastern Kentucky, and Virginia, aggregated 16,305,356,730 gross ton miles.

This was 5.3 per cent of the total gross ton miles for the Eastern Territory, as shown in Group III, Table 3, of Exhibit No. 13. That may not, in my opinion, be considered negligible.

(Discussion off the record.)

The Witness: Some one, at the first part of this present hearing, raised the question as to whether or not the tonnage, other than coal and coke, originated and handled by the Pocahontas region roads wasn't as great as that of the Southern region railroads. I have had some figures made on that which are covered by my Exhibit No. 226.

[fol. 5435] By Mr. McCollester:

Q. That is one of the points made by Dr. Edwards, is it not, that we eliminate the principal Southern coal-carrying roads from Southern Territory that take a large part of the traffic other than coal out of Southern Territory, but that situation doesn't obtain in separating the Pocahontas lines from the other Official Territory lines?

A. Yes; and I think he was asked that question as to the proportion of the tonnage. That is what I have undertaken to develop.

Q. That is the purpose of your next exhibit?

A. Yes, sir. I don't think it needs any comment. The exhibit itself is self-explanatory, and shows what it is.

Q. Continue, Mr. Bell.

A. I am through with the part about the effect of the territorial allocation of the railroads.

Commr. Aitchison: Mr. Bell, suppose we are convinced that you are right about that; can we take the Edwards' exhibits *and make the changes that you think should be* made?

The Witness: Mr. Commissioner, there is too much for me and my organization, and with my lack of knowledge of those figures to re-work Dr. Edwards' exhibits. I am simply pointing out some of the infirmities that would be bound to have an appreciable effect on the final showing.

Commr. Aitchison: Are you prepared to show how appreciable?

[fol. 5436] The Witness: The only one I can give any figures on showed that was based on this movement of coal which I had in other records, showing the movement of coal originated on the Chesapeake & Ohio, and Norfolk and Western, that was moved in and through C.F.A. Territory.

I had those in other records, and I undertook to make this computation there which I have shown, and, as I have testified to in Exhibit No. 225.

Taking that coal traffic alone, it amounted to 5 per cent of the total gross ton miles of the Eastern Territory, and over 27 per cent of the gross ton miles of the Pocahontas region.

With terminal costs and the line-haul cost being less in the Pocahontas region, and with the same consist of traffic in the Pocahontas region lines in the Eastern Territory and C. F. A. territory as in the Pocahontas region, and those costs being appreciably lower than the average for Eastern Territory No. 2, I cannot escape the feeling that it would make quite a difference in the costs in the Eastern Territory if those two lines were included; but I should point out in all fairness, too, as Dr. Edwards has done in his Exhibit No. 195—he has included the Pocahontas region lines along with the Eastern District to show what the effect would be, but he does not show the effect of consolidating the Central-Eastern and Great Lakes region and the Pocahontas region lines, exclusive of the New England [fol. 5437] region.

Mr. McCollester: In other words, Mr. Commissioner, from Dr. Edwards' own exhibits, we have some combinations, or rather, his costs resulting from some different combinations, and there is, therefore, to that extent, the opportunity to argue which combinations are the ones to be taken for the purposes of this case.

We think it can properly be argued that still other refinements should be made in order to enable the Commission to have the full picture before it, assuming, which we do not agree with, that the average costs computed, as Dr. Edwards has done, are basis for prescribing rates in this proceeding.

The Witness: For example, as I mentioned, Mr. Commissioner, there is about 13 per cent of the mileage of the Southern Railway which is within what we term as official rate territory. That is the lines north of Richmond and north of Lynchburg, and including the lines extending from East St. Louis to New Albany, Indiana.

There is quite a substantial part of the Mobile & Ohio Railroad. The heaviest density line of that railroad, I think, is in that territory, but I have no means of telling just what effect that would have. Then, as I say, I could only pick out the ones where I could get some kind of a cross-section on the coal.

Commr. Aitchison: One of the lowest density lines is [fol. 5438] the Chesapeake & Ohio in Indiana, isn't it?

The Witness: One of the lowest density lines?

Commr. Aitchison: Yes.

The Witness: I would say it was lower density than its line in Kentucky and West Virginia but whether it is one of the lowest density lines in Indiana, I have no means of telling. The commodity statistics don't show the density of the traffic in the various States.

Commr. Aitchison: I thought possibly your general knowledge would enable you to answer it.

The Witness: I would say that it would be much lighter than Southern West Virginia and Eastern Kentucky.

Commr. Aitchison: The physical characteristics of the line are such as to make it a light line?

The Witness: Yes, and it hasn't got the coal traffic.

Commr. Aitchison: And such that the Chesapeake & Ohio doesn't even run its through passenger trains over it?

The Witness: I don't know about its passenger service.

Commr. Aitchison: Isn't it a fact that the Chesapeake & Ohio uses the New York Central lines?

The Witness: For a portion of its mileage, I think.

Commr. Aitchison: From Cincinnati to Chicago—I mean, Indianapolis.

The Witness: It uses it for part of the line. Where it is I don't remember. So far as I know, they have some [fol. 5439] trackage over the New York Central, but I have taken the 230 miles for my comparison, where the bulk of the coal traffic is handled, and that is up to Toledo.

Commr. Aitchison: Can you tell me how many passenger trains a day are operated over that Chesapeake & Ohio line from Cincinnati to Chicago? (Handing witness paper).

The Witness: One each way.

Commr. Aitchison: Is it a through train or local?

The Witness: Local.

By Mr. McCollester:

Q. Mr. Bell, the next phase of Dr. Edwards' testimony that you want to take up, is it not, is the matter of his objection to separating out from the rest of the South the four major coal-carrying roads of the South in the same way that the Pocahontas lines are separated from the other Official Lines?

A. At page 112 of Exhibit No. 196, Dr. Edwards states that the elimination of the four railroads included in Group III, page 5, of my Exhibit No. 166, namely the Clinchfield, the L & N, the Southern, and Illinois Central, would eliminate 83 per cent of the coal and coke carried in the Southern region in 1939. That statement is correct.

Page 3, of my Exhibit No. 165, shows 88 per cent, but it includes all Southern Railway System lines. Based on the Southern Railway alone being included, the figure is 83 per cent.

[fol. 5440] These four railroads originated 96 per cent of the bituminous coal in the Southern region, and all other lines originated only 4 per cent.

Of the total tons originated and terminated on the same railroads, 92½ per cent was on these four railroads.

87 per cent of the total freight revenue on coal and coke in the Southern region accrued to the four railroads in question.

I do not show on page 3 of my Exhibit No. 165 the total tons terminated by the respective groups of railroads, but the total bituminous coal terminated, including coal originated and terminated on the same railroads, and coal received from connections and terminated was 24,233,503 tons, out of which 18,889,239 tons, or 76 per cent, was terminated by the four railroads.

Stated differently, the other 23 railroads in the South originated only 4 per cent of the total tons of bituminous coal originated. They carried only 17 per cent of the total tons carried, and terminated only 24.2 per cent of all the coal originated and terminated, and received from connections and terminated.

Of course, all of Dr. Edwards' figures, and mine as well, are subject to the infirmity that they include coal originated and handled by the Illinois Central System in sections of the country not included in the Southern region, and they [fol. 5441] include coal transported by the Southern Railway on its line in Indiana and Illinois.

If that Illinois Central and Southern Railway coal should be excluded, it would increase the percentage of tons originated by the Louisville & Nashville to the total originated tonnage in the Southern region from 55½ per cent to 71.3 per cent.

Q. Let me interrupt you right there, Mr. Bell, to ask you about a point which I think is covered in the record, but I want to be sure.

Nevertheless, this coal carried by the Southern Railway and the Illinois Central in Official Territory, for whatever effect is has on costs, is reflected in the costs computed by Dr. Edwards for the railroads in Southern Territory?

A. The Southern Railway is, but Dr. Edwards made a segregation for the Illinois Central.

After stating that the elimination of the four railroads would eliminate 83 per cent of the total tons of coal and coke carried in the Southern region, Dr. Edwards goes on to state how much other traffic would be eliminated from the Southern region by the elimination of these railroads, followed by the statement that as three of the railroads, namely, the L. & N., Southern Railway, and Illinois Central, have average hauls longer than those obtaining for the remaining railroads in the South, the percentage of the total [fol. 5442] ton miles of the commodities I have eliminated, is probably greater than the figures he named would indicate.

Dr. Edwards also says that after eliminating the four coal-carrying railroads from the Southern group, that I have compared the resulting—I think a better word is "remaining"—figures with the Central-Eastern and Great Lakes regions without any adjustments, despite the fact that 47 per cent of their tonnage consists of coal.

He then goes on to say that the elimination of the coal-carrying railroads in the Central-Eastern and Great Lakes regions would remove 94.01 per cent of the coal tonnage handled in the East and 85.63 per cent of all other tonnage carried.

He then enumerates 11 railroads out of the 41 railroads in the Central-Eastern and Great Lakes regions, which he says would be left for the purpose of comparison.

He concludes his discussion by referring to his comments in reply to Witness Day, Item 9, page 97, of his Exhibit No. 196, as to the effect of coal traffic upon costs.

The point of my testimony and my exhibits is to show that the heavy concentration of low-grade, low-expense coal and coke traffic on four railroads in the Southern region, to say nothing of the other low-grade, low-expense traffic—would have the effect of reducing the unit and total expenses of the other twenty-three railroads in the South, that is, if the average unit costs of all of the railroads in the [fol. 5443] South were applied to these 23 railroads which handle a very small proportion of the coal traffic, as well as a small proportion of the other low-grade, low-expense traffic; that, on the other hand, the same conditions would not obtain in the Central-Eastern and Great Lakes regions where coal and coke traffic is diffused over practically all of the railroads, all or most of which also have a back-log of a tremendous volume of other low-grade, low-expense products of mines traffic.

Q. Mr. Bell, let me ask you: You do not mean that, do you, that the elimination of these coal-carrying roads would have the effect of reducing the actual costs of the other 23 roads?

A. No; but *he* would have a computed cost of as much less than the actual costs of those railroads.

At transcript 3630, I testified that the coal and coke traffic in proportion to the total traffic is much more evenly divided over the lines in Official Territory than in the Southern Region, and that the railroads in the Central, Eastern and Great Lakes regions also have a back-log of a heavy tonnage of products of mines in general, which is not the case with the Southern Railroads.

Dr. Edwards, on page 113, of his Exhibit No. 196, shows the proportion of coal tonnage handled to the total tonnage handled on the Baltimore & Ohio, Pennsylvania, Erie, and New York Central in comparison with the four coal-carry- [fol. 5444] ing railroads in the Southern region.

On page 97, in his answer to Witness Day, he compares the coal traffic handled on the L. & N., Illinois Central, and Southern Railway with the coal traffic handled by the Baltimore & Ohio, Erie, New York Central, New York, Chicago & St. Louis, and the Wabash.

The statement is made on page 97 that, excluding Kentucky, the coal traffic is more evenly distributed in the remaining areas of the South and in the East.

The proof of the pudding is in chewing the string—at least, I was brought up on that old adage.

I will give you some figures here. Taking four coal-carrying railroads in the Southern region, the Clinchfield, the L. & N., the Illinois Central, and the Southern, they constituted 47.8 per cent of the total miles operated in freight service in the Southern region; they operated 95.8 per cent of the total tons of bituminous coal originated in the Southern region; they handled 82.8 per cent of all the coal and coke handled.

Take the first group of railroads that Dr. Edwards mentioned on page 113, the Baltimore & Ohio, Pennsylvania, Erie, and New York Central, the percentage of total mileage operated in the Central, Eastern and Great Lakes regions, is 47.6 per cent, or within 1. per cent of the percentage proportion operated by these four railroads in the Southern [fol. 5445] region, yet those four railroads in the Eastern region originated only 23.3 per cent of all the bituminous coal originated, compared with 96 per cent on the four lines in the Southern region.

Those four Eastern railroads handled 43.4 per cent of the coal and coke handled, as compared with 82.8 per cent by the four roads.

Commr. Aitchison: What is your 100 per cent in these cases?

The Witness: I have taken the mileage, the total mileage operated in freight service in the Central, Eastern, and Great Lakes regions, added together as a normal to get the mileage of 47.6 per cent operated by the Baltimore & Ohio, Pennsylvania, Erie Railroad, and New York Central out of the total mileage operated in those two regions.

Commr. Aitchison: What is your next 100 per cent?

The Witness: My next 100 per cent, where I take my southern railroads, the four southern railroads operated 47.8 per cent of the mileage operated in the Southern region.

Commr. Aitchison: You used another one?

The Witness: Now then, of the total tons of coal originated——

Commr. Aitchison (Interposing): By whom?

The Witness: By all railroads in the Central-Eastern and Great Lakes regions, 100 per cent.

Commr. Aitchison: That is what I wanted.

[fol. 5446] The Witness: And the same is true of the Southern region, the total tons originated is the 100 per cent basis.

Taking the second group of railroads which Dr. Edwards used on that page 97 of Exhibit No. 196, where he added the Pennsylvania Railroad, they were 59.3 per cent of the total miles in the Great Lakes and Central-Eastern regions.

Those railroads originated 43 per cent of the coal and coke originated, and handled 59.2 per cent, again compared with the 95.8 per cent, and 82.8 per cent, respectively, for the Southern region railroads.

Mr. McCollester: Off the record.

(Discussion off the record.)

The Witness: On page 97, the lines are the Baltimore & Ohio, Erie, New York Central, New York, Chicago & St. Louis, and Wabash.

On page 113, the Baltimore & Ohio, Pennsylvania, Erie, and New York Central, the way I have it down, my statement is correct.

By Mr. McCollester:

Q. Now, will you take up your exhibit No. 227, Mr. Bell?

A. That exhibit is designed to expose the fallacy of taking a few hand*k*-picked railroads in the Central-Eastern and Great Lakes regions for comparison with the four coal-carrying railroads in the southern region.

I do not think it necessary to read the explanation ap- [fol. 5447] pearing in the caption of the exhibit, and I simply call attention to the comparisons in Part 1 as between Section 1 and Section 2.

Commr. Splawn: Would the comparison have been better if you had taken other railroads, more representative?

The Witness: Mr. Commissioner, in Section 1, of Part 1, there were four southern railroads which originate coal and coke in heavy volume, and it shows in comparison that there were 26 railroads in the Central-Eastern and Great Lakes regions.

Now, in Section 2 I have shown that there are the four railroads first mentioned, together with three others which handle in excess of one million tons and 500,000 tons, respectively, of anthracite coal, bituminous coal, and coke, in the southern region, a total of seven railroads. That is in excess of 500,000 tons, and less than one million tons handled by five railroads in the southern region.

We come to the Central-Eastern and Great Lakes regions. You have got 34 railroads that handle in excess of one million tons.

Then you have four railroads which handle in excess of 500,000 tons and less than one million tons.

Commr. Splawn: You speak of exposing a fallacy here, of making a comparison of these four Southern railroads, with a few hand-picked roads. Just what is the fallacy?

[fol. 5448] The Witness: I mean that there are only four railroads, that Dr. Edwards has shown that there are four railroads in the South, and he has picked against that four railroads in the East, and he compares that to show that there is as great a diffusion of coal in the South as in the East. I would say there is not. As against four railroads in the South, you have 26 railroads in the Central-Eastern, and Great Lakes regions; and they have a great diffusion of coal through that territory, which the next page of my exhibit is intended to show.

Commr. Aitchison: You have included anthracite as well as bituminous, haven't you?

The Witness: Yes, sir. So did he. He said "Coal and coke". The South originates no anthracite, of course, but if you want to call——

Commr. Aitchison: (Interposing) The South originates more anthracite?

The Witness: None—very little; practically none.

Commr. Aitchison: I couldn't hear you.

The Witness: Of course, it is not fair, as I see it, to take the South's bituminous coal and not to include anthracite coal along with the bituminous coal in the northern territory.

As a matter of fact, my Exhibit No. 166, from which Dr. Edwards' figures were computed, includes the anthracite along with the bituminous and the coke in the eastern territory.

Commr. Aitchison: If you had included the 26 railroads [fol. 5449] in one group in the Central-Eastern and Great Lakes regions, followed Dr. Edwards' method, what is your idea as to where you would have come out, or do you have any opinion?

The Witness: I have a notion it would have shown upon even better in favor of the South; I mean, of showing that there is a greater diffusion in the handling of coal in the Central-Eastern and Great Lakes regions by a great many railroads, as compared with only four railroads in the South.

If you will notice, on the bottom of Sheet 1, of Exhibit No. 227, it shows that 17 of the railroads in the East handled in excess of 5,000,000 tons each, and 11 of them handled in excess of 10,000,000 tons each, and 4 of them handled in excess of 30,000,000 tons each; whereas, there were only 7 railroads in the South that handled in excess of 1,000,000 tons.

Commr. Aitchison: I see that, all right, but I am trying to translate this.

The Witness: I will be glad to compute that for you, if you would like to have it, Mr. Commissioner.

Commr. Aitchison: Have you done it?

The Witness: I say, I have not computed it, but I will be glad to do it. I am expressing my off-hand opinion.

Commr. Aitchison: We would like to close up this record.

Do you have any present impression as to where it would wind you up? If you do have, I would like to have it in the record.

[fol. 5450] The Witness: I cannot do it by the time you close today. I can get it in by tomorrow morning, but not tonight.

Mr. McCollester: Just what is your question, Mr. Chairman? As to where it ends up in the matter of costs?

Commr. Aitchison: Yes.

The Witness: In the matter of comparisons.

Mr. McCollester: I think he is talking about costs.

Commr. Aitchison: Yes.

The Witness: I cannot say anything about costs.

Mr. McCollester: We have Dr. Edwards' testimony that a substantial volume of coal traffic tends to reduce average costs. I think we can argue, and I think Dr. Edwards himself has agreed that if you eliminate the four roads in the South that are the major coal-carrying roads, the costs for the others must be substantially higher than the figures which he has computed for the South, as a whole, including the four coal-carrying roads in the South.

Commr. Aitchison: Suppose we eliminate these 26 railroads from the North and give them a rate structure of their own, what would the costs of the remaining roads be?

Mr. McCollester: In the North, the coal traffic is much more diffused among the major railroads of the North.

Commr. Aitchison: There are 15 of them, but he doesn't cite them.

Mr. McCollester: You have got the North pretty well [fol. 5451] covered by these 27.

Commr. Aitchison: I don't see it.

Commr. Norman: I think the South is pretty well covered by those four, too.

Mr. McCollester: Not so well.

Chrm. Aldredge: Supposing you eliminated those four roads out of the South, how would you deal with the——

The Witness (Interposing): Mr. Commissioner, my whole point is this: It has been argued here by Mr. Norman and others that you should have the same level of freight rates in different territories, on the theory that you have the same unit cost in all of the territories.

Am I right or wrong, Mr. Norman?

Mr. Norman: You are wrong.

The Witness: That is the substance of your contention; I mean, it is the basis for your contention, is it not?

Commr. Aitchison: We will examine him a little bit later. You are on the witness stand.

The Witness: All right.

I want to show that you can take the four coal-carrying railroads in the South, and if you please, you can go over and take the three bridge railroads which operate between Cincinnati and New Orleans, and they are the low-cost operating railroads.

If you are going to compute your average costs in the [fol. 5452] South by including the southern railroads, you won't have enough on the 23 railroads to buy axle grease; but if you are going to compute on the same low-cost ton miles thrown into the general average, and Mr. Norman would have you make your rates on that basis, I want to show the unfairness of any such way of trying to make rates in any such manner, based on such costs.

Chmn. Aldredge: To pursue your theory to its ultimate conclusion, if it is logical, then we would have to treat each railroad separately.

The Witness: Not necessarily, but you should not attempt to make your rates based on average unit costs.

Chmn. Aldredge: If you don't make them upon an average covering some territory in which more than one railroad is operating, the only other alternative is to deal with each railroad separately, isn't it?

The Witness: I don't find that necessarily so.

Chmn. Aldredge: You either have to average or deal separately, haven't you, individually?

Mr. McCollester: Mr. Commissioners,——

Chmn. Aldredge (Interposing): I asked the witness a question, and I would like to have an answer before you interrupt.

Mr. McCollester: All right.

The Witness: I do not believe you should make your [fol. 5453] rates based on a cost factor alone. You have too many other factors to take into consideration.

Chmn. Aldredge: I don't know that anybody is arguing that.

So far as costs are concerned, whatever weight is attached to it, haven't we got to deal with it on the average by including several roads together, or deal with each road individually? Is there any other alternative?

The Witness: If you expect to make your costs on a unit average, the answer is "Yes."

Chmn. Aldredge: If you use costs at all, you have either got to use individual railroads or by putting railroads together.

The Witness: Mr. Commissioner, may I say——

Chmn. Aldredge (Interposing): Can you answer me?

The Witness: I am going to answer you.

I can say, if it becomes necessary to take lines like the Florida East Coast Railroad, the Atlantic Coast Line Railroad and the Seaboard Airline Railroad, which are, strictly speaking, Carolina and Florida lines, you can make rates for those lines without having to include the low-grade coal-carrying line of the L. & N. Railroad, because it is hundreds of miles from the other railroads.

Chmn. Aldredge: That is perhaps the way they were doing it when you started out with your railroad in the [fol. 5454] South; they had a separation of Mississippi Valley Territory, and Carolina, and South Eastern?

The Witness: Certainly, we did.

Chmn. Aldredge: As a practical matter, what caused them to get away from it?

The Witness: Of course, it was the competitive and the market situation of trying to make the rates so as to keep your goods at the various markets. That is just exactly the theory that should exist today, and which they have been trying to tear down.

Chmn. Aldredge: As a practical matter, it didn't work, did it?

The Witness: Yes.

Chmn. Aldredge: It did work?

The Witness: Yes.

Chmn. Aldredge: Why did they change it?

The Witness: I don't know that they have changed it.

Chmn. Aldredge: Didn't they change it in the South?

The Witness: They have changed the territory and associations, and consolidated railroads, but you can't show me today that the railroads are making their rates based on unit costs or anything else.

Chmn. Aldredge: I wasn't talking about that.

The Witness: You asked me if they hadn't changed their method of rate-making. I say no.

[fol. 5455] Chmn. Aldredge: You said it would be feasible to separate Carolina roads, and the Mississippi Valley

Roads; and the South-eastern roads; isn't that virtually what you said; and make different rates?

The Witness: I said it would be feasible; yes.

Chmn. Aldredge: Then I directed your attention to the fact that, historically, that is the way it used to be; isn't that right?

The Witness: Yes, you are right.

Chmn. Aldredge: And that, in the course of time, that changed; is that right?

The Witness: The territories changed.

Chmn. Aldredge: No, they changed that method of dividing the territories for the purpose of making rates; isn't that right?

The Witness: For the purpose of class rates; you are right. They didn't change it. The Commission changed it in 13494.

Commr. Aitchison: Congress changed it in 1920, when it provided that we should establish rates as uniformly as possible.

The Witness: The Southern region and Pocahontas region, and so on.

Chmn. Aldredge: It was actually giving way?

The Witness: The territories changed, but it was not until [fol. 5456] 13494 and before that, Fourth Section violations in the South-East, that the Commission changed the basis for making rates. You had a different rate for the Carolina roads, the South-eastern roads, the Mississippi Valley, and so forth, right up to the time of the decision in 13494, except to the extent of the Fourth Section Compliance, which was decided in 1914.

Chmn. Aldredge: As a practical matter, that system didn't hold out; is that right?

The Witness. It hasn't held out; I will say that much; yes.

Mr. McCollester: Mr. Commissioner, may I say a word now?

I want to say that I conceive the Commission under the statute seeks to correct illegality in the rate structure and doesn't sit as traffic manager of the railroads.

I cannot conceive that to prescribe rates which would be based on average costs for a territory, which would mean that they would be less than cost for some of the railroads in the territory, merely because as a matter of traffic policy that might be necessary, is within the power and function of the Commission, and we are prepared to argue that.

Chmn. Aldredge: Of course, you know in the Southern Class investigation, in the Consolidated Southern Cases, and in the Western Trunk Line Cases, and in the Eastern Class Rate Case, the Commission dealt with rates in that [fol. 5457] manner presumably by averaging—in fact, it so stated—by averaging transportation conditions over a wide territory.

Those decisions were all made effective. They haven't been, so far as I know, challenged yet on account of their illegality.

Mr. McCollester: Mr. Commissioner, we experimented with a law under which rates were to be made on a territorial basis, with the idea that they would be insufficient for some lines in the territory and excessive for others, and that there would then be recapture, and that recapture provision has been eliminated, so that unless you have all of the railroads in a given section of the country in one system, I see no way under the law by which the Commission can find unlawful rates which are necessary to maintain, to provide the cost for the most expensive line in the territory, where that basis of rates is prescribed.

If it results in excessive profits for other lines, that is another matter and can be dealt with.

Chmn. Aldredge: So that according to your theory of the law, the Commission would have to proceed to make rates for each individual carrier, and why should it deal with the carrier, as a whole? Don't they have differences over different divisions of the same carrier?

Mr. McCollester: I think that is the whole difference between the carriers acting as carriers, running their busi- [fol. 5458] ness, acting as traffic managers, and the Commission acting as a body to prevent violations of the law.

Chmn. Aldredge: I think the Commission might use some common sense in administering the law.

Commr. Aitchison: It is an old story. We started with Mr. Kimball at the time he was wanting rates made between Denver and Salt Lake on the basis of the Union Pacific rates and costs, and the Commission refused to permit that without consideration of the higher expense line of D. & R. G.

Mr. Norman: I am having great trouble restraining myself, but I will not say anything.

Commr. Aitchison: You are doing very well.

By Mr. McCollester:

Q. All right, proceed, Mr. Bell.

A. Sheet 2, of Exhibit No. 227, Section 1, shows the tons of bituminous coal which originated and terminated in the respective southern States, with the exception of Virginia.

Section 2 shows the similar information for the Trunk Line-C. F. A. States, and the New England States, and also for Virginia and West Virginia.

Just a brief comment: Excluding Kentucky, the seven Southern States shown in Section 1 originated only 8,125,000 tons of bituminous coal, and practically all of it was originated in Alabama and Tennessee; in fact, Alabama originated more than 63 per cent of the total, although Alabama terminated only 1,868,000 tons in excess of the coal originated.

[fol. 5459] Tennessee terminated 2,272,000 tons in excess of the tons originated.

The total tons terminated in the seven States exceeded the tons originated to the extent of 9,850,000 tons.

Virginia is not included in the States named in Section 1, because large quantities of Virginia coal *is* originated and terminated, or is received from connections and terminated on the lines of the Norfolk & Western, R. F. & P., and Chesapeake & Ohio Railroad, as well as on the Southern Railway.

The States of Tennessee, North Carolina, and South Carolina not only consume quite heavy quantities of coal originating on the Southern Railway, the C. C. & O., or the Clinchfield, the L. & N., and the little Interstate Railroad in the States of Virginia and Kentucky, but they consume large quantities of coal from the New River and Pocahontas Districts of the Chesapeake & Ohio and the Norfolk & Western.

Just to come to another phase of this coal situation, and Dr. Edwards' testimony, I think it makes the point that Mr. McCollester referred to a moment ago: At page 96 of Exhibit No. 196, Dr. Edwards states that for the calendar year 1941, Kentucky accounted for 74 per cent of the coal and iron ore originated in the South.

We have no 1941 tonnage figures in the present record so that that could be checked up, but I assume he has computed his figures from Schedule 541-A of the Annual Reports. [fol. 5460] My computations from the Annual Reports show that 31,528,964 tons of bituminous coal originated in Kentucky on the C. N. O. & T. P., the Louisville & Nashville, the Southern Railway, and the Illinois Central, the four railroads in the State of Kentucky situated in the southern region which originates any bituminous coal.

9,900,690 tons originated in the other Southern States, excluding Virginia, would make a total, added to this 31,000,000 tons, of Kentucky coal of 42,793,175 tons originating in the southern region, excluding that originating in Southwestern Virginia.

Of the coal originated in Kentucky by the four Southern region railroads, only 220,000 tons originated on the Southern Railway, and 51,000 tons on the C. N. O. & T. P., neither of those lines being heavy coal originating lines in the State of Kentucky.

The Illinois Central originated 4,545,000 tons, and I might mention incidentally, a very large portion of that went to the Ohio River and points beyond, and wasn't diffused so much in the Southern territory.

The L. & N. originated, therefore, 26,382,00 tons of coal, which was 84.64 per cent of the Kentucky total. It was 86.6 per cent of the total coal originated by the L. & N. in 1941, for its entire line of 30,436,859 tons.

In 1939 the L. & N. originated a total of 23,271,940 tons. [fol. 5461] Based on the 1941 ratio, the L. & N. originated 20,162,809 tons in Kentucky in 1939; that is, out of the total originated.

Based on information furnished me by the Louisville & Nashville Railroad—I referred to this in my previous testimony—I was able to spot 17,585,000 tons of the 1939 coal, or 87 per cent of it, as having destinations in the Ohio River cities and beyond, the average haul on over 16,000,000 tons of that coal being 240 miles.

Assuming the same ratio for 1941 as for 1939, out of the total of 26,382,000 tons of coal originated by the L. & N. in Kentucky in 1941, 22,952,000 tons moved to the Ohio River cities and beyond.

I don't quite get the point of Dr. Edwards' inclusion of iron ore in his figures in as much as only 77 tons of iron ore originated on Southern region lines in the State of Kentucky in 1941, and that ore originated on the L. & N.

I may, incidentally, mention that I looked to see if any originated on the C. & O., and Norfolk & Western, and none of them showed any originating movement of iron ore in Kentucky in that year.

By Mr. McCollester:

Q. Do you have any reply to make to Dr. Edwards' comments on the subject of elimination of bridge lines from consideration in the territory as a whole.

A. Yes; Item 7, page 114, of Exhibit No. 196, Dr. Edwards said that the same criticism applied to the elimina- [fol. 5462] tion from the Southern region of the Alabama Great Western, C. N. O. & T. P., and New Orleans-North Eastern, as his criticism of the elimination of the four coal-carrying roads from the Southern region; and in that connection Dr. Edwards made the observation that "The existence of bridge traffic serves to reduce the common expenses of handling all traffic."

The existence of bridge traffic not only serves to reduce the expense of the bridge lines, but the effect also is to reduce the computed average expense of all the railroads in the region.

It does not reduce the actual expense of any individual railroad, or group of railroads, operating in the region other than of the bridge lines.

In column 13, page 8, of my Exhibit No. 166, the average revenue per net ton mile on the C. N. O. & T. P., the A. G. S., and the New Orleans & North Eastern in 1939, was 5.43 mills; including taxes and rents 6.21 mills.

The fact that the bridge traffic of these railroads results in this low average cost does not mean that the higher actual costs of the Atlantic Coastline, Seaboard Airline, and Florida-East Coast, respectively, of 9.21 mills, 8.4 mills, and 10.19 mills, and including rents and taxes of 10.94 mills, 9.36 mills, and 12.59 mills, are reduced one iota by reason of the low operating expense for the three bridge lines which serve a section of the South, hundreds of miles [fol. 5463] removed from these three North and South railroads operating on the edge of the South Atlantic Seaboard, and whose consist of traffic and operating conditions are in no wise comparable with the bridge lines.

This would be true also of attempting to make rates for these three railroads in the eastern section of the Southern regions, based on any unit costs for the region as a whole, which includes the four coal-carrying railroads and the three bridge railroads in the average.

That is the discusion which we have just had, Mr. Commissioner, about the effect of that.

Chmn. Aldredge: I am interested in getting your proposal on the rate structure.

The Witness: I am not making any proposal. I am just trying to show some facts and figures. I haven't got any proposal in the case.

By Mr. McCollester:

Q. Have you any comment now, Mr. Bell, on Dr. Edwards' testimony regarding your use of net ton mile cost figures?

A. I have just a little to say on that, because I think there is some misunderstanding about what I have had in mind.

In Item 5—this is Item 5 of Dr. Edwards' Exhibit No. 196, page 111—he refers to the comparisons of the cost per revenue net ton mile for various groups of railroads in the South and East, appearing on pages 5 and 6 of my Exhibit [fol. 5464] No. 166, and refers in connection therewith to my testimony at pages 3623-4, of the record.

The purpose of these comparisons was designed to show the infirmity of undertaking to employ the average unit costs for different rate territories as the yard stick for making rates on all kinds of traffic in all railroads within the respective territories, or interterritorially.

The exhibit was designed to show the effect of such procedure and, particularly, by the inclusion in such average unit costs of the much lower costs of a small group of railroads whose traffic is comprised most largely of coal and coke and other low-grade, low-expense traffic, whereas the unit costs of other railroads in the same general territory may be very appreciably higher because of the lack of, or the sparsity of such traffic.

The comparisons are premised upon identically the premise mentioned by Dr. Edwards on page 112, of his Exhibit No. 196, that the territory having the greatest proportion of coal traffic will inevitably show the lowest cost, and the even more definite statement which appears on page 96 of Exhibit No. 196, "that if much of the coal traffic is highly centralized in one section of a territory, much of the expense for handling this coal may not be common to the cost of handling all other traffic throughout the territory."

I use the revenue net ton mile cost comparisons because [fol. 5465] they were the only authentic figures that were available on file with the Interstate Commerce Commission from which any kind of a real cost comparison could be made.

I can't refrain from saying that all of the factors entering into the freight expense are reflected in the net revenue ton mile expense, and those costs can't be changed by a set of mathematical calculations designed to prove they are something else; so even assuming that each and every figure made by Dr. Edwards in his various studies are corrected, when you come to the costs of a given railroad or a group of railroads, your ultimate answer is bound to be to the same effect as the use of the cost per net revenue ton mile.

I am speaking, of course, of freight expense.

Q. Have you any comment, Mr. Bell, upon Item 8, on page 114, of Dr. Edwards' Exhibit No. 196, with reference to the assignment of freight to different kinds of equipment?

A. In that item, Dr. Edwards refers to my testimony at page 3646, given at Columbus.

In accordance with the understanding at that time, that I would discuss it with Dr. Edwards, we had a conference on December 9th, at which Mr. Parr and others of Dr. Edwards' organization were present, and at which the subject was gone into to the extent that either of us had any relevant information.

I want to say I think Dr. Edwards deserves a great deal of credit for his sincere effort to obtain the facts, but in my [fol. 5466] opinion, the allocation of commodities between different types of cars, as shown in Table No. 4 of his Exhibit No. 195, and the computations on the cost based thereon, do not yet portray the actual situation.

As Dr. Edwards has stated in his Exhibit No. 196, and in the footnote to Table 4 of his Exhibit No. 195, his allocations are based first on estimates made by a committee of the Association of American Railroads, and an examination of those estimates immediately discloses that much of their data is wholly inaccurate.

I think Dr. Edwards agreed with me on that.

Second, the data which I furnished him, most of which was based on my own general knowledge and experience and certain investigations I had made relating to a few specific analyses.

Third, the one-day traffic study made by the ODT, covering their movement on May 27, 1942. This one-day study, in my judgment, cannot be accepted as reflecting the day-in and day-out types of equipment used 365 days in the year, throughout any one or all of the different sections of the United States.

Commr. Aitchison: Do you mind a question, Mr. Bell? Do you know of any equipment that was not being used on that day, May 27, 1942?

The Witness: I don't know that there was any equipment but I was going to say——

[fol. 5467] Commr. Aitchison: (Interposing:) All of the equipment we had was used on that day, and more of it since; isn't that right?

The Witness: I think unquestionably—I think that was the thing I was going to mention also, that in 1942 the war conditions obtained, the supply of equipment was limited and in many, many instances freight ordinarily loaded in one traffic car was being loaded in another traffic car.

Commr. Aitchison: Is that an unusual thing in this country?

The Witness: Not in war times.

Commr. Aitchison: In times of peace?

The Witness: It was more unusual during the war times.

Commr. Aitchison: Is it an unusual thing in times of peace?

The Witness: You say it is unusual?

Commr. Aitchison: Is it an unusual thing in times of peace that all equipment which is available is being used, and that it is being used not for the primary purpose for which it was designed?

The Witness: Yes, I think it is unusual in times of peace.

Commr. Aitchison: All right. I will ask you if that condition didn't exist in the following years that I will cite: 1905, 1906, 1914, 1915, 1916, 1920, 1922?

[fol. 5468] The Witness: I will go along with you in 1914. I don't remember 1905 and 1906. I will go along with you in 1914, because it was during a war period.

Commr. Aitchison: We were not at war then.

The Witness: We were not then, but we were in war in 1917, but certainly we were getting ready.

Commr. Aitchison: I didn't mention 1917.

The Witness: 1914.

Commr. Aitchison: We were not in war.

The Witness: But we were producing munitions for the other nations overseas, outside of Germany, of course.

By Mr. McCollester:

Q. It doesn't follow, Mr. Bell, even if all the equipment is being used, that the commodities having the average loadings and other characteristics, were loaded in the particular kinds of equipment that were used by Dr. Edwards for the purposes——

A. (Interposing:) They might be using all of the equipment, but they might not be using box cars for box car traffic, and gondola cars for gondola traffic.

Commr. Aitchison: The only purpose of my question was there have been times when the use of all the equipmment in the manner in which Mr. Bell described could not be ascribed to war.

The Witness: I don't agree with you, Mr. Commissioner, on that. We have our own opinion about it, of course.

[fol. 5469] Commr. Aitchison: Was there any war on in 1920?

The Witness: No; we had just gotten over one.

Commr. Aitchison: Was there any war in 1922?

The Witness: No; and that is the time we were just going into the depression.

Commr. Aitchison: In 1922?

The Witness: Yes.

Mr. McCollester: 1932, you mean, don't you?

Commr. Aitchison: We had just gotten over the one in 1921.

The Witness: We had gotten over the war, and, if my memory is right, in 1920, you had your heavy increase of traffic, and revenue, resulting from the war conditions, construction work, and so forth, but that fell off with a slump in 1921.

Where you had increased the rates in 1920, you reduced them in 1922 because of the effect the rates were having on business.

Commr. Aitchison: In 1922 it was necessary for this Commission to exercise its Service Department because of the car shortage. That is a matter of History, Mr. Bell.

By Mr. McCollester:

Q. Have you anything more, Mr. Bell?

Chmn. Alldredge: As I understand you, you don't believe a sample study can be accurate at any time?

The Witness: No; I don't believe that a one-day study would be accurate.

[fol. 5470] Frankly, I have been very much surprised that the railroads did not have information showing the types of cars used for loading of different commodities. They don't know what types of cars they are using for the loading of their commodities except in a general way. They have no statistics on it.

Of course, Table 4 gives equal weight to the cars from the South and Northwest, and so forth.

Frankly, as I say, I think Dr. Edwards did the very best he could on it, but personally I wouldn't be willing to accept it for rate-making purposes.

Commr. Aitchison: He had a two-day study, too, not one-day.

The Witness: He said in his testimony that he used the one-day study for this.

Commr. Aitchison: Off the record.

(Discussion off the record.)

By Mr. McCollester:

Q. Mr. Bell, just one question, in regard to the traffic study: Have you any comment on Witness Aitchison, Exhibit No. 194, which superseded Exhibit No. 14, I believe?

A. I have made an examination of that exhibit, and the testimony I gave in connection with Dr. Aitchison's Exhibit No. 14 would apply.

Q. Were Exhibits Nos. 224 to 227, inclusive, prepared by you or under your supervision and direction, and are [fol. 5471] they true to the best of your knowledge and information and belief?

Mr. McCollester: We offer them in evidence.

Commr. Aitchison: Without objection they are received.

(Exhibits 224, 225, 226, 227, Witness Bell, received in evidence.)

Mr. McCollester: You may cross-examine.
Commr. Aitchison: Just a min-te, before you begin cross-examination. Off the record.

(Discussion off the record.)

Mr. Smelker: I have one question.
Commr. Aitchison: Mr. Smelker?

Cross-examination.

By Mr. Smelker:

Q. You have consumed considerable time and seemed to be perturbed, Mr. Bell, concerning Dr. Edwards' failure to include the segments of the Southern roads into Official Classification Territory.

Will you turn to page 3, of his Exhibit No. 196? Do you have it there? Will you refer to the statement at the top, which is the carload fully distributed costs by territories, and refer to line 3, "eastern including New England;" for box car traffic it is 101 per cent of United States Costs, and for gondola and hopper car traffic it is 101 per cent of United States costs.

Now, refer to the line "Eastern including New England and State of Kentucky." There the fully distributed costs for box car traffic are 100 per cent and for gondola and [fol. 5472] hopper car traffic are 99 per cent.

Don't you think that Dr. Edwards' failure to include the tonnage which moved over these segments of these lines would be negligible in its effect on the Eastern costs?

A. I don't know. You have got your New England traffic included there. You haven't got that computation made for the Central-Eastern, and Great Lakes regions?

Q. In one case, in Eastern, New England is thrown in by Dr. Edwards, and in the second case "Eastern including New England, and the State of Kentucky" is thrown in, where the tonnage is enormous, as far as Kentucky is concerned, and the costs are lower.

A. Kentucky, yes; but where have you got Eastern not including New England?

Q. I mean Eastern and New England with and without Kentucky.

A. I see where those figures are.

Commr. Aitchison: I can't hear what you say up here.

The Witness: I saw those figures before I got on the stand.

By Mr. Smelker:

Q. In view of the fact that the costs only vary 1. per cent as far as box car traffic is concerned, and as far as gondola traffic is concerned only 2 per cent, whether Kentucky is included or not, don't you think that his failure to include the tonnage handled over these segments of the Southern lines, in Official Classification Territory, would be negligible. [fol. 5473] A. No, I don't think so, and I stated the reasons why.

Q. It would be less than 1. per cent as far as box car traffic is concerned?

A. I wouldn't say without making the computations myself, which I am not prepared to do, but I tried to give my illustration of the coal alone for the Pocahontas lines in the C. F. A. Territory.

I mentioned that you have omitted 12 per cent of the line of the Southern Railway; you omitted 7.8 per cent, I think it was, of the M & O; and you have a very heavy traffic moving on the Southern Railway in Kentucky, and a fairly heavy traffic moving over those lines in Indiana. You know we have the Mobile & Ohio, with the heavy traffic, and these others. When you take one case, it may not make so much difference, but when you add a whole lot of them together, it is like adding a lot of drops of water; you get a bucketful.

Q. In any case, it would be less than 1. per cent?

A. I won't admit that. The point is I don't know what it would be, and I said so.

Mr. Semelker: That is all.

Commr. Aitchison: Have you tried to find out what the effect would be?

The Witness: With my limited means at my command; [fol. 5474] but I could not take the time to go over every one of these figures, and moreover, I didn't have the information that Dr. Edwards didn't have, and that is he did not make the segregation of these lines of the Southern lines. He didn't make the segregation of the lines of the Norfolk & Western, the Chesapeake & Ohio, and Kentucky, and without the information there I had to guess at it, and he is guessing at it if he brings up these figures here, unless he gets the segregation for these various lines.

Commr. Aitchison: I take it the answer to my question is "No"?

The Witness: "No"; that is the answer; yes, sir.

By Mr. Norman:

Q. Would you think that the exclusion or inclusion of those segments would have as much or more effect upon averages than the exclusion or inclusion of the State of Kentucky?

A. I don't know, Mr. Norman.

Mr. Norman: That is all.

Commr. Aitchison: From a practical standpoint, based on your experience, do you know any reason that Pocahontas would be included in either of these territories?

The Witness: Pocahontas naturally should be included along with the Central-Eastern and Great Lakes regions because it is a part of the Official Territory.

It takes the same rate levels in so far as your general [fol. 5475] class and commodity traffic is concerned. It is made on the Official Territory basis.

Commr. Aitchison: Any further examination of Mr. Bell.

Mr. McCollester: Nothing further.

Commr. Aitchison: You may stand aside.

(Witness excused.)

Mr. McCollester: Mr. Chairman, while we were off the record, I brought up a matter that I would like now to bring up on the record.

Since Dr. Aitchison was on the witness stand to identify her Exhibit No. 194, I asked her if any attempt had been made, on the basis of examination of tariffs, to determine with respect to the study of the movement of carload traffic on May 27, 1942, what of the traffic was class rate and what moved at commodities or exceptions, and I understood from her answer that some such attempt had been made to analyze and break down the figures on the basis of the tariffs.

I should like to recall her to the witness stand for the purpose of asking that the results of the analysis be put into the record, and I may say that in making this request I want the record to show that we do not concede that a one-day test, especially during war times, affords a proper basis for the making of rates for the future, and as to the methods by which the analysis, whatever it is, was made, we reserve our right to question its validity, but for what [fol. 5476] it is, we would like it in the record for the benefit of all parties, so that we may have the benefit of any or all the studies that have been made in connection with this May 27, 1942, traffic test.

Dr. B. Aitchison was recalled as a witness, and testified as follows:

Direct examination.

By Mr. McCollecter:

Q. You have hear my preliminary statements, Dr. Aitchison. Have you the results of such an analysis, and, if so, are they in such form that they can be either read into the record or filed in some exhibit?

A. Yes, sir; I have some results there for September 23rd.

Q. Not May 27th?

A. Not May 27th.

Q. Will you tell me just how the analysis or the breakdown was made.

A. Since the waybills for the day were not available for any lengthy examination, the Office of Defense Transportation made for us a tabulation showing for each individual commodity shipped, such as copper cathodes, corn-on-the-ear, pecans in shells, that is, they itemized the number of carload shipped from each territory to each other territory.

These tabulations were turned over to the Rate Branch of our Bureau of Traffic. That Branch went through the tabulations and for each movement marked the most probable rate charged. This tabulation did not give origin and [fol. 5477] destination explicitly, but merely the origin rate territory, and the destination rate territory, as defined for this proceeding.

Q. Was it confined to inter-territorial or when it gave origin and destination rate territories, might those be the same, so that the intra-territorial movements were included also?

A. All movements were included also both intra-territorial and inter-territorial.

There were three classes of rates recognized: The so-called pure class rate where an article moved under the percentage of first class shown for it in the classification; the exception rating, where it moved under a percentage of first class other than that shown for it in the rating and the commodity——

Q. (Interposing:) In the rating classification?

A. In the rating classification; and the commodity rate, where it was a specific commodity rate, and in some cases I believe—there has been some dispute about this—where there has been a column commodity rate, some people, I believe, call those exception rates, but in the printed rates they are listed as column commodity rates, so that they were coded as commodity rates in that case.

Mr. Norman: Although made on a percentage of the first class?

The Witness: Yes; they were related to first class, but [fol. 5478] were a specific commodity and not listed as an exception, quite the contrary. They were named commodity rates.

By Mr. McCollester:

Q. As I understand it, what was done was not to check the actual waybills to find out as to each particular shipment, whether the particular rate charged was a class rate or commodity rate.

A. That is true.

Q. But instead, the people of the Division used their best judgment, based on their familiarity there with the tariffs, as to what the rate probably was?

A. And with the movements, too, where the movements were.

Commr. Aitchison: May I interrupt?

For illustration, they wouldn't fool around much on telling what coal was?

The Witness: No, they would not.

By Mr. McCollester:

Q. With that explanation, can you give the results? Are they stated in per cents?

A. They are stated in per cents, as far as carloads go, and carload traffic on September 23rd, for the whole traffic, 4.1 per cent carried class rates, 10.7 per cent exception ratings, and 85.2 per cent commodity rates.

~~Mr. Norman: That is the percentage of number of shipments?~~

The Witness: Yes; that is percentage of carloads.

By Mr. McCollester:

Q. Have you that on a revenue basis?

[fol. 5479] A. An estimated revenue basis.

Unfortunately, due to the manner in which our commodity districts are reported, it was not possible to break the revenue down on a territorial basis.

The carloads are broken down on a territorial basis.

Q. The figures you have just given are for the whole?

A. For the whole United States.

Q. Now, let's have the revenue.

A. Revenue class rate traffic, 6.3 per cent; exception rating traffic 16.1 per cent; commodity rate traffic 77.6 per cent of the total.

Commr. Aitchison: The first figures are numbers of cars?

The Witness: Percentage of total cars.

By Mr. McCollester:

Q. Now, Dr. Aitchison, can you give us the break-down of the per cents of total cars by movements; that is, within each territory, and from one terrritory to another?

A. Which territories are you interested in? There are 25 combinations.

Q. Is this in some form——

A. (Interposing) It can be reproduced and sent to you.

~~Q. It can be?~~

A. Yes, sir.

Mr. McCollester: Could that be done, Mr. Chairman?

Commr. Aitchison: Certainly.

[fol. 5480] Mr. McCollester: I think that would be desirable.

And, if it is agreeable to the Commission, I would appreciate having it done.

Mr. Norman: It is too long to read it.

Commr. Aitchison: Well, we will treat them as an exhibit coming in after the hearing and give it a number when it is ready for distribution. It will take its appropriate number at that time.

Mr. McCollester: That is all I have. Thank you very much.

Commr. Aitchison: Cross Examine.

Mr. Norman: No cross examination.

Commr. Aitchison: You are excused.

(Witness excused.)

Commr. Aitchison: Mr. Grubbs?

Mr. Grubbs: I would like to recall Mr. Morris.

Ben. F. Morris was recalled as a witness, resumed the stand and testified as follows:

Commr. Aitchison: You have been sworn, haven't you?

The Witness: Yes, sir.

Direct examination.

By Mr. Grubbs:

Q. Mr. Morris, Mr. Hart took you to task for referring to north-bound movement over the L. & N. under the general commodity description "Manufacturers and Miscellane-[fol. 5481]ous" and for not breaking that down.

Do you have the break-down?

A. Yes, sir.

Mr. Grubbs: Now, if your Honors please, Mr. Morris could read this into the record. It would consume some time and I have showed this to Mr. Norman, and, if it is agreeable to him, as I understand it is, I would like to have the privilege of submitting this statement following the close of the hearing as an exhibit to be marked later when it is received.

Commr. Aitchison: If there is no objection, that may be done.

Mr. Norman: No objection.

Mr. Grubbs:

Q. Mr. Morris, in the course of Mr. Henderson's testimony, he referred to the failure of the railroads to make rates on steel truck bodies from Nashville to a point in New Jersey on the Official Territory Level.

Will you tell us if that was considered by the railroads, and if they did not put in those rates, why they did not?

A. It was considered by the Louisville and Nashville, I know. When the request was received from Mr. Henderson, we developed that the truck bodies had been purchased by one of the Governmental authorities f. o. b. Nashville, and since the Governmental authorities did not indicate any necessity for revision of the rates from Nashville to Metuchen, I think it is, New Jersey, we did not consider it [fol. 5482] necessary to make any readjustment in the rate.

Q. In the course of Mr. Hart's testimony, he indicated, based on his general knowledge, that the movement of class traffic south-bound was very largely, or to a substantial extent, was by forwarder. He confined that on cross-examination to l.c.l. traffic.

I will ask you if you have any figures for the Louisville & Nashville which will indicate for us the proportion of forwarder traffic to total traffic south-bound.

A. I have been able to obtain today our tonnage of forwarder traffic from the Cincinnati group where the forwarder traffic handled by the Louisville & Nashville very largely originates, to the entire South; and our total tonnage of merchandise traffic from and through Cincinnati to the South.

The figures are: Forwarder traffic during 1942, 71,012 tons; merchandise traffic, from and through Cincinnati, 204,880 tons.

Commr. Aitchison: Is that the way you move your forwarder traffic to New York?

The Witness: Mr. Chairman, such as we get; yes, sir; it comes to us at Cincinnati.

By Mr. Grubbs:

Q. Is the Louisville & Nashville one of the largest movers of forwarder traffic in the South?

A. It is a rather large mover, relatively. I shouldn't say it is the largest, Mr. Grubbs.

[fol. 5843] Q. I said, one of the largest.

A. The Illinois Central probably handles the greater volume.

Q. And is the L & N next to the Illinois Central?

A. The L & N is second or third. I am not quite certain how our movement compares with that of the Southern Railway.

Q. I will ask you this question: Has forwarder traffic displaced on the L & N l.c.l. traffic in package cars?

A. We have watched the movement very closely since its inception with us, and our best judgment is that it has not taken any material amount of tonnage from our package car, merchandise car.

Mr. Grubbs: If your Honor please, I think that before this witness steps down, it would be well for Mr. Clark to make a statement on this general subject that he has to make, and it might obviate any further questions from him on this subject.

Mr. Clark: At this time, may it please your Honor, may we introduced by reference, certain excerpts from a decision of the Commission which I will make reference to?

Commr. Aitchison: Yes, you may.

Mr. Clark: It is factual data.

Commr. Aitchison: What is it?

Mr. Clark: I say it is factual data.

The decision is in 28323, entitled "All Freight Rates to Points in Southern Territory", decided November 13, 1942, [fol. 5484] reported at 253 ICC 623.

From a mimeographed copy, I want to introduce the second paragraph, on sheet 11, the five lines dealing with the Southern Railway All-Commodity Rates in Less Carload Traffic; also Appendix B and the two paragraphs on sheet 10, the Appendix in those two paragraphs dealing with such comparisons for the Illinois Central and the Louisville & Nashville.

Mr. Norman: I understand that this is just a movement from C. F. A. and that there are similar figures in an Eastern Case about the movement from the East to the South; is that right, Mr. Hart?

Mr. Hart: Yes, in I & S 5027, I think it is, the figures are shown into Atlanta, forwarder traffic, which of course doesn't move by rail but by truck. In discussing this matter, I had reference to forwarder traffic, whether it moves by rail or truck, into Atlanta.

Commr. Aitchison: Of course, our reports of revenues distinguish between revenues received from forwarder traffic and that received from other traffic. That is already in the record here.

If you want to have one of these other cases considered, Mr. Norman, I think probably Mr. Clark will agree that you may give the citation to it later and refer to it in your brief, citing the part you want to have us consider.

Mr. Norman: All right.

[fol. 5485] Commr. Aitchison: That stipulation is made.

Mr. Grubbs: That is all for this witness.

Commr. Aitchison: Cross-examine.

Cross-examination.

By Mr. Norman:

Q. Mr. Morris, some question was raised here this morning in cross-examining Mr. Hart as to whether or not any movement of tires, automobile tires, from the South, north-bound on this break-down which you are now to put in exhibit form—it appears that for the L & N alone in the month of September, there were 102 cars.

Wouldn't you consider that a substantial movement?

A. Without checking the figure, I would be obliged to say I would consider 102 cars a rather material movement of tires; yes, sir.

Mr. Norman: That is all.

Commr. Aitchison: You may stand aside.

(Witness excused.)

Commr. Aitchison: Anything further, Mr. Grubbs.

Mr. Grubbs: As I indicated yesterday, the Southern Lines feel that the Southern Governors have not treated us fairly.

As Mr. Norman said yesterday, every one knows the kind of a case the Southern railroads made at the very beginning.

Of course, everybody does not attach the implication that he wanted attached to his statement, but what he did in the beginning of this case was to lay before you our rates [illegible] [fol. 5486] show you what we had and how we got it, and we say we were unacquainted with any substantial or any material complaint from any shipper and that we felt that we were entitled to hear those who had some complaint against our rate, and that when we should be given an opportunity to say what we had to say about those complaints.

Now, Mr. Norman, or the Southern Governors, presented some shipper witnesses at Indianapolis, at which time they said they would probably wish to introduce one or two more at Columbus, which they did, but they have come here and presented additional witnesses and have presented, in Mr. Hart particularly, one witness who represents himself, as the embodiment of many interests and he, in his Exhibit No. 220, listed those concerns for whom he speaks, particularly; indicating that they have some special grievance.

It is just physically impossible for us to meet this showing that has been rushed on us here at the last moment.

As I said yesterday, Mr. Hart's exhibit, to which I have referred, wasn't even circulated to us until yesterday in the manner in which your Honor said they should be circulated.

We have been taken by surprise, but we have no disposition to prolong this proceeding, but I do think we ought to be given, in these circumstances, an opportunity to present any facts that we think ought to be presented on the subjects that have been discussed by Mr. Hart, and also by [fol. 5487] these two other witnesses, and Mr. Ryan and Mr. Weaver.

It seems to us the reasonable thing to do in the circumstances, not desiring to prolong the proceeding, would be to permit us to submit in writing, within a reasonable time, any statements we have to make, such statements, of course, to be sworn to, and we hereby make such a request.

Commr. Aitchison: That request is made on behalf of whom?

Mr. Grubbs: That request is made on behalf of Southern Railroads, Class I Southern Railroads.

Mr. Norman: I will say, in the first place, that I don't think they have been treated unfairly in any respect, and we have offered nothing here that was not in rebuttal of evidence that was put on after we offered our testimony at Indianapolis and Columbus.

Furthermore, most of this testimony is from people who stated that that didn't understand that their rates were involved here, or that they could get relief here, but they were testifying to show that they were supporting, as an industry, this effort, and further, that they would not be able to get the Northern lines to concur; in other words, they were rebutting testimony that was put in by the railroads.

Now, in so far as their filing a sworn statement, I haven't any objection to it. Let them file it. Of course, I would have no chance to cross-examine their witnesses.

[fol. 5488] Commr. Aitchison: I think if that is going to be done, in all fairness you ought to be permitted to submit such questions as you want to.

Mr. Norman: And have them answered.

Mr. Grubbs: And have them answered. That is quite agreeable to us.

Commr. Aitchison: Will you be able to handle that so it can be treated as an exhibit coming in after the hearing?

Mr. Grubbs: It will be all right, sir. Do you want to fix a time for that, your Honor?

Commr. Aitchison: What time do you want?

Mr. Grubbs: I would like to ask for fifften days.

Commr, Aitchison: Why do you need fifteen days?

Mr. Grubbs: Because, your Honor, Witness Hart has quite a number of these manufacturers or these shippers and we desire to inquire into and analyze the facts concerning their requests on us for rates and to determine whether there has been competition that we felt required or did not require such rates.

Commr. Aitchison: I am not asking you about the character of the showing. I think fifteen days is too long. I will allow you ten days.

Any further testimony, gentlemen? Anything further?

(No response.)

If not, the record of the testimony will be closed.

The Commission designates this as a proposed report case.

[fol. 5489] Briefs of the parties, pursuant to the Rules of practice will be filed and served on or before June 30th.

Attention is called to the provisions of the Rules of Practice with respect to the mechanical provisions of the briefs themselves, or the documents themselves, and also the necessity for proper abstracts and requested findings of fact.

In order to make as light a burden as possible with respect to the service of briefs, and so forth, the Commission will undertake, before the time for service, to compile a service list of parties on whom briefs may be served, and therefore, the request will be made that the various interests which are in common canvass the situation between themselves and endeavor to arrange for the service of as limited a number as possible; and, if it is possible, to arrange for service upon one party for a group. That is considered desirable.

Of course, we all have in mind now the limitations of labor and limitations upon paper. We want to meet that as much as we can, considering the importance of the case.

Is there anything further?

Mr. McCollester: Mr. Chairman, in regard to the brief, I beg to inquire whether the Commission feels that it should, for the purposes of this proceeding, insist upon the observance of that portion of the sub-paragraph "D" of Rule 91, which states that the abstract of evidence relied upon should follow the statement of the case and precede the argument.

[fol. 5490] Chairman Alldredge: The abstract?

Mr. McCollester: The abstract; yes.

It would be just my impression that we would write a more useful brief——

Commr. Aitchison: (Interposing) Read the next sentence.

Mr. McCollester: Y s, but I make this reference because your Honor referred to the subject of abstracts and asked that we observe the rule regarding abstracts.

The next paragraph says we don't have to if we don't want to.

Commr. Aitchison: I was not attempting to get away from that rule which gives the option, but I was calling attention to the necessity for giving us an abstract, and I meant to make that cover just exactly the scope of the rule which you have cited, 91 "D", and in the event no abstract is given, of course, references to the record should be given instead.

The rule is pretty clear and there was no intention to give the rule a narrower application than the rule itself provides.

Mr. McCollester: I have an idea in this sort of proceeding the most helpful brief would be one that included a discussion of the evidence relied upon in with the argument rather than in a separate portion of the brief.

Commr. Aitchison: If there is nothing further, then, subject to the reception of three or four exhibits, that is, Mr. Grubbs one and Mr. Norman one, the hearing will be closed.

(Whereupon, at 5:10 o'clock p. m., the hearing was closed.)

Chapter III—Rate territory distribution of energy resources III–1

Relative significance of energy resources III–1
Coal III–1
Waterpower versus fuel energies III–2
Reserves of fuel energy III–8
Coal reserves III–9
Petroleum reserves III–14
Natural gas reserves III–20
Total energy of mineral fuel resources III–22
Water power resources III–24

Chapter IV—Rate territory distribution of agricultural resources IV–1

Importance of agricultural resources IV–1
Agricultural resources as measured by quality of land IV–5
Agricultural resources as measured by the distribution of land used for agriculture IV–12
Agricultural resources as measured by potential production of crops IV–14
Agricultural resources as measured by 1939 crop production IV–16
General discussion IV–16
Acreage harvested for 29 principal crops IV–23
Crop production IV–24
Yield per acre by crops IV–25
Farm value of individual crops IV–27
Average farm price per acre of individual crops IV–28
Agricultural resources as measured by 1939 livestock and poultry production IV–30
Production of livestock and poultry products IV–30
Value of livestock and poultry products IV–32
Average farm value per unit IV–32
Relation of agricultural resources to agricultural products IV–34
Farm products over 500 million dollars IV–34
Dairy products and hay IV–36
Corn IV–40
Meat animals IV–46

Page
Cotton IV-48
Chickens and eggs IV-49

[fol. 5495]

Chapter IV—Rate territory distribution of agricultural resources (Cont'd.)

Relation of agricultural resources to agricultural products (cont'd.)

Wheat IV-51
Farm products of 50 to 500 million dollars IV-53
Tobacco IV-55
Oats IV-55
Commercial truck crops IV-58
Potatoes IV-58
Apples IV-60
Sheep IV-62
Other IV-62
Diversification of crops IV-75

Chapter V—Rate territory distribution of forest resources V-1

Forest regions V-1
Original forest area V-7
Forest land a multiple use resource V-8
Forest areas by freight rate territories V-9
Stand of timber by freight rate territories V-15
Total stand of softwoods and hardwoods by character of growth V-15
Stand of saw timber by character of growth V-15
Stand of cordwood V-18
Ranking of freight rate territories in forest areas and stands of timber V-26
Stand of timber per acre of forest areas V-31
Stand of saw timber by species V-34
Current annual growth V-39
Current annual growth and drain V-41
Future timber requirements V-43

Chapter VI—Rate territory distribution of human resources VI-1

Total and gainfully employed population VI-1
Major occupations VI-3

Page
Social-economic groupings VI-4
  Professional persons VI-6
  Proprietors, managers, and officials VI-7
  Farm owners and tenants VI-8
  Skilled workers and foremen VI-11
  Semi-skilled and unskilled workers VI-11

[fol. 5504] DISTRIBUTION OF THE NATURAL RESOURCES OF THE UNITED STATES BY FREIGHT RATE TERRITORIES

CHAPTER I

Nature of the Study

Divisions of the Study

Irrespective of whether and to what extent freight rates are or are not responsible for the differences in the growth and development of the different freight rate territories, it seems reasonable to suppose that both freight rates and the material prosperity of the population of these rate areas have been associated in some degree with the natural resources within their boundaries.

Although much has been said and written regarding these natural resources, it does not appear that any comprehensive study has been made of their rate territory distribution. Geographical presentations for most of the data employed in this study are usually confined to state figures or to those for the grand divisions established by the Bureau of the Census of the United States Department of Commerce for the tabulation of Census data. In this study, however, the natural resources have been summarized by freight rate areas to the extent that it has been found practicable to make such a distribution.

For this purpose natural resources have been broadly interpreted to mean the soil, water, and mineral resources of the United States which are substantially the same divisions as those used by the National Resources Planning Board.[1]

For convenience in discussion, however, this classification has been revised and the analysis divided into five major topics: mineral, energy, agricultural, forest, and [fol. 5505] human resources. The first includes a survey of the significant mineral reserves and comparisons of mineral production, excluding the energy minerals. The reserves and production of the latter, together with the actual and potential generation of energy from water power, are considered in the second subdivision dealing with the energy resources. The third section surveys the actual production of agricultural crops and livestock products together with the potential capacity for production, giving consideration to the natural limitations imposed thereon by the character of the soil, the climate, the rainfall, and other similar factors. The fourth section presents the distribution of our reserves of different kinds and classes of timber. Last but not least the final section sets forth the distribution of our human resources according to various social-economic groupings within each rate territory.

---

[1] A Report on National Planning and Public Works in Relation to Natural Resources, etc., National Resources Planning Board, 1934, Foreward, p. v.

Character of the Data

Of necessity the character of the data used for measuring these resources and distributing them by rate territories varies greatly. Certain of our resources are subject in considerable degree to quantitative measurement. This is true, for example, of the reserves of some minerals as well as timber. Data on reserves, however, are frequently unavailable, and in the case of agriculture the resources are not of a character to permit quantitative estimates of reserves. Available information regarding resources in terms of reserves, however, has been employed in the case of timber and of certain significant minerals. Where the character of the commodity or the nature of the information was such that data of this sort were not available, it has been necessary to use figures of actual and potential production, product value, and the like. For the most part the material utilized has been drawn from standard government publications and reports or from quasi-governmental reports such as those of the National Resources Committee. In some cases, however, publications and authors of recognized standing have been used where other information was not available.

[fol. 5506] For a variety of reasons the data employed throughout the report are of differing dates. Because of the unavailability as yet of certain data from the recent census, it has been necessary to use the preceding one in several cases. At the time the mineral resources material was prepared the Minerals Yearbook for 1940 was not available and consequently figures from the 1939 volume were perforce utilized except that some information of a later date was procured directly from the Bureau of Mines. There are other cases where data are now available which were not so at the time the statistical tables were prepared. In practically all cases, however, the data utilized were those of the latest data available at the time when the particular sections were written. Owing to the limited staff available, it was impracticable to prepare all the subdivisions of the report simultaneously.

Distribution of the Data by Rate Territories

The boundaries of the five freight rate territories, for which data have been compiled, are set forth in an order of the Commission dated January 9, 1940, requiring Class I railways to compile certain information bearing on the Class Rate Case.[1] The five rate territories may be described by reference to the Census grand division groupings of states. Map A also shows the areas included in each territory.[2]

The Census grand divisions include in the South Atlantic grouping Delaware, Maryland, the District of Columbia, all within Official territory, and West Virginia, also in Official territory except for a very narrow strip in the

[fol. 5508] extreme southern portion of the state. Virginia is likewise included with the South Atlantic grouping although the entire northern section of the state (amounting to over 60 percent of the land area) is in Official territory. The Southern rate territory includes the Census East South Central and South Atlantic states with the exceptions noted above in the South Atlantic division, and that portion of Louisiana lying east of the Mississippi. The New England, Middle Atlantic, and East North Central states are all included within Official territory except that the northern peninsula of Michigan and all of Wisconsin except a narrow strip of territory along Lake Superior and the southeastern corner of that state are excluded from that rate area. Western Trunk Line territory coincides with the Census West North Central states but also includes the northern peninsula of Michigan, and all of Wisconsin except as specified above, the eastern third of Colorado, and the southeastern corner of Wyoming. The remainder of the latter two states belongs to the Census Mountain division. Southwestern territory coincides with the Census West South Central division except that that portion of Louisiana east of the Mississippi is included in Southern territory as noted above. Mountain-Pacifis territory includes the Census grand divisions corresponding to these designations with the exception of those parts of Colorado and Wyoming referred to above which are included in Western Trunk Line territory.

The freight rate territory boundaries, therefore, cut across state lines in Michigan, Wisconsin, Virginia, West Virginia, Louisiana, Colorado, and Wyoming, and most of the information which is presented in this report is not available by counties but only by states. In some cases the areas of reserves or production in states which are within two rate territories are so definitely located in the one or the other that the distribution of the resources could be made in a single table. In most cases, however, it has been necessary to show the rate territory distribution in two groupings in which the figures of each of the "two territory" states are assigned alternatively to the two rate areas involved. Exceptions are West Virginia and Wyoming, which because of the small areas outside Official and Mountain-Pacific territories, respectively, have been assigned to these territories throughout.

[fol. 5508a] In the case of agriculture, county figures for the commodities are available and the state figures have been distributed between the two rate territories according to the county lines. The Census of Agriculture as of 1939 was not complete at the date of this report so 1929 Census county figures were used in apportioning 1939 state figures reported by the United States Department of Agriculture. All counties in the upper peninsula of Michigan were included in Western Trunk Line territory and all counties in the lower peninsula were included in Official territory. In Wisconsin, Virginia, Louisiana, and Colorado the counties were allocated to territories so as to form a line roughly corresponding with the rate territory boundaries shown by Map A.

[fol. 5509]

CHAPTER II

Rate Territory Distribution of Mineral Resources

Relative Importance of Different Minerals

Information regarding the reserves of minerals except for those which constitute sources of fuel energy and a few others are relatively scanty and in some cases at least practically nonexistent. "Some minerals are so erratic in occurrence that estimates even after careful geologic study and interpretation may mean little or nothing. * * * Some minerals are so common that there has been little incentive to estimate their quantities. Some have not been estimated because the known deposits were uneconomic. It is surprising * * * how few geologists and engineers have been willing to estimate quantitatively the amount of ore in mines, quarries or prospects."[1]

---

[1] Kenneth Leith and Donald M. Liddell, The Mineral Reserves of the United States and Its Capacity for Production, National Resources Committee, March 1936, p. 4. "Mining has always been a more or less hazardous venture: * * * The very nature of ore deposits makes predictions of their reserves hazardous. A coal bed can often be measured and its total available tonnage calculated. An iron mine is sometimes carefully drilled and its tonnage may be estimated without great chance of error. A gold mine on the other hand may consist of pockets of ore haphazardly distributed in a wide lode. Any estimate of the amount of

[fol. 5510] This rather general shortage of statistical estimates of the reserves of many minerals has made it necessary to discuss a number of these resources in terms other than the reserves available in the various freight rate territories. Although the latter is admittedly a less satisfactory basis of comparison, it is not as seriously objectionable as might at first be thought. For certain nonferrous metals considerable information on reserves is available. A few additional minerals are so generally and profusely distributed that the reserves of the different freight rate territories might not be particularly significant. According to the Census of Mines and Quarries in 1929, for example, sand and gravel was produced in practically every state in the Union and limestone in 42 states.[1] In these cases it is quite possible that the total reserves of every freight rate territory are so huge in terms of any probable utilization that the proportion in any rate territory is much less likely to exercise a significant influence on the economic development of the territory than is the case with those minerals required in large quantities by the economy but which are both more scarce in terms of total consumption and also less profusely distributed.

Outside of the energy *numerals*, copper, iron ore, limestone and sand and gravel, the reserves of most minerals are of relatively minor importance in our economy. By this it is not intended to imply that certain of these minerals are

---

'pay ore' in a mine of this sort would of necessity be * * * at best a relatively inaccurate prediction.

"Ore bodies may occur in many shapes and patterns. A vein lode has definite boundaries. In it there will usually be found little sub-ore or mineral bearing material of a grade too low to be economically mined. On the other hand, many disseminated ore bodies * * * have indefinite boundaries either of grade or of thickness, determined only by economic limits. These limits vary with changing technological process and with the economic factors of costs. * * * Improved processes of extraction will probably allow for the utilization of mineral raw materials not now considered economic." Ibid., p. 3.

[1] Mines and Quarries, 1929, Fifteenth Census of the United States, Table 3, Sand and Gravel, p. 374; Table 25, Limestone, p. 357; Table 32, Crushed stone, p. 366.

not exceedingly important in a technical sense, as strategic or critical in the economy. For certain of such minerals even reasonably satisfactory substitutes may not be available in the present state of technology and the production of goods requiring such strategic minerals may obviously be completely dependent thereon. But in terms of the value product, the average number of persons employed, or the average wages paid, many mineral industries are insignificant even though highly essential where satisfactory substitutes are not available. In addition, there is the fact that some of these minerals, such as the various kinds of stone, can be extensively substituted for one another in [fol. 5511] certain kinds of use. The extent of the reserves of many minerals, therefore, seems clearly not as important for this analysis as in the size of the reserves of various energy minerals, iron ore, and certain nonferrous metals for which considerable data on such reserves are available and which are much more important to our economy in terms of value product, employment, and wages.

The situation described is indicated in more detail by Table 1 which shows the Census figures of value product, wage jobs, and wages for each of 32 mineral industries in 1929, the figures for the year 1939 not being available at this writing.[1]

---

[1] The year is not, perhaps, particularly important since the table is designed only to indicate something with regard to the relative importance of those metallic and nonmetallic minerals which are not classifiable as energy resources. For this purpose 1929 with its high level of productivity and employment may be almost as satisfactory as 1939 were figures for the later year available. Figures of volume and value of production are compiled by the Bureau of Mines also but these figures are not on a uniform basis. For some minerals they are on a "mined" basis. In others they are "shipped from mines", "produced", "sold by producers", "sold or used by producers". The Bureau of the Census, on the other hand, endeavors to present the total value to the producer of the actual annual output. Also the labor data are not available in the Bureau of Mines figures.

(Here follows 1 photolithograph, side folio 5512)

Table 1.--Relative Importance of Specified Mineral Industries, Excluding Energy Minerals, 1929 1/

Industry	Value of production	Labor	
		Average wage earners	Wages
Metallic minerals:			
Copper	$283,517,373	44,502	$73,199,785

Total non-metallic	407,462,001	94,808	116,690,918
Grand total	1,041,283,107	204,884	287,222,717

See next page for footnotes.

[fol. 5513] (Footnote for Table 1:)

---

[1] Mines and Quarries, Fifteenth Census of the U. S., 1929, Tables 9 and 24, pp. 13 and 33-35.

[2] Bauxite, molybdenum, titanium, tungsten, vanadium.

[3] Includes glass sand and molding sand.

[4] Diatomaceous earth, ganister, quartz, quartzite, silica rock, silica sand, siliceous mica schist, tripoli.

[5] Emery, garnet and industrial sapphires and diamonds, etc.

[fol. 5514] Out of a total of 32 m[illegible]llic and nonmetallic minerals, only four—copper, iron ore, limestone, and sand and gravel—showed a product value of in excess of 100 million dollars and only eight (lead, zinc, granite, sulphur and pyrites in addition to the foregoing) a value in excess of 30 million dollars.

The total value product of these eight industries in 1929 aggregated $890,492,117 or 85.52 per cent of the total of $1,041,283,107 for all minerals excluding the fuel energy sources. Again, only three of these industries (copper, iron ore, and limestone) employed an average of over 20 thousand persons, and only seven (lead, zinc, granite, sand and gravel in addition to the foregoing) more than 10 thousand. These seven industries also were the only ones each of which paid more than 10 million dollars in wages in 1929. In fact, except for these seven mineral industries and gold mining, no other accounted for as many as 5,000 wage earners.

The seven industries with over 10,000 wage earners (copper, iron ore, lead, zinc, limestone, granite, and sand and gravel) accounted for 159,323 wage earners out of a total of 204,884 or 77.8 per cent of the total, the remaining 25 or more industries offering jobs to only 45,561 workers or less than 2,000 per industry on the average. These seven industries also paid $230,508,978 in wages in 1929 or more than 80 per cent of the total wage bill of $287,222,717.

The figures in this table and the discussion in connection therewith may be taken as the explanation of the restriction of the analysis of the mineral reserves by rate territories to the more important minerals and of the failure to carry this analysis into certain of the minor and profusely distributed minerals.

Metallic Mineral Reserves

Most of the data bearing on the mineral reserves of the United States have been brought together by Leith and Liddell in their report on mineral reserves for the National Resources Committee.[1] The material contained in that report has been the primary source of the information for the distribution of the more important mineral reserves by freight rate territories.

[fol. 5515] *Iron Ore*

There are so many known bodies of iron ore of different composition that it is a matter of great difficulty to draw a line between ore and sub-ore or between available and non-available ore. The report for the Resources Committee has drawn these lines on the basis of a hypothetical year of normal industrial activity which involves "an assumption of continuing conditions substantially the same as those obtaining at the present time."[1a]

The greatest iron ore deposits of the country are in the Lake Superior District. Estimates of the Minnesota and Michigan Tax Commissioners places the unmined iron ore reserves as of 1939 at 1,208,047,717 gross tons in Minnesota and 149,754,897 tons in Michigan.[2] Besides these there is in the great Mesabi range of Minnesota[3] (1) a vast quantity of intermediate material "a grand mixture of ore, sand and rock" with a 40 per cent iron content and (2) iron bearing rock which contains 30 per cent iron and is far too poor for the steel plants to utilize.[4] Large quantities of the intermediates are already being subjected to beneficiation processes. According to Leith and Liddell, the introduction of these beneficiation practices has added over 300 million tons to the Mesabi reserves and the reserves of the low grade ores and taconites in this region not at present ~~economically beneficiable~~ may be estimated at 72 billion tons or a reserve for 1,600 years of use if it all could be used.[5]

[3] The Mesabi contains 95 per cent of all the ore known to exist in Minnesota. E. W. Davis, Mines Experiment Station, Univ. of Minnesota, The Iron Ore Deposits of Minnesota, Univ. of Minnesota Bull. XL, No. 27, March 1937, p. 2.

[4] Ibid., p. 3.

[fol. 5516] The Birmingham ore district is a self-contained industrial entity or economic unit so far as the production of steel is concerned. This area contains large quantities of iron ore and coking coal together with fluxing dolomite and limestone all in a basin about 40 miles wide by 75 in length. Drilling has demonstrated commercial ore in a quantity of 1½ to 2 billion tons or enough to last some 300 years at the expected rate of production.[1]

Besides these two major sources of ore there are extensive deposits of varying degrees of availability or nonavailability scattered throughout the country. There are known iron ore deposits in 13 of the states west of the Mississippi River,[2] most of them small and unimportant, and there are also deposits in the eastern states. The Tennessee River Basin apparently has in excess of 100 million tons available and nearly 2 billion tons of reserves, nonavailable at present, chiefly in northeastern Tennessee and southwestern Virginia. Map 1 shows the distribution of these iron ore reserves.

Although the Mineral Reserves Report for the National Resources Committee gave no tabulation of reserves by states or census districts, Table 2 presented herewith has been prepared from the data contained in the text of that report. This table attempts to show the iron ore reserves of the United States by freight rate territories on the basis both of ore substantially available at the present time and of the present nonavailable ore which may subsequently become available. In the groupings in Table 2 the Lake Superior reserves are all assigned to Western Trunk Line territory and the reserves of Maryland and Virginia to the Southern territory. These latter reserves were grouped by the Mineral Reserves Report with other southern states and perforce were included in that grouping. The tonnage involved is at present unavailable and not likely to become available because of the unprofitableness of operation. Colorado has been grouped with the Mountain-Pacific division, the tonnage being so small that it has but little effect on the figures. The large Southwestern deposit in the State of Texas, though classed as available, was not commercial at the time of the Report (1936) although it was apparently expected to become so in the not far distant future.

[fol. 5518] Table 2—Iron Ore Reserves of the United States by Freight Rate Territories, 1935 (approximate)[1]

(In millions of tons of 2,240 lbs.)[2]

Territory	Available		Nonavailable	
	Amount	% of U. S.	Amount	% of U. S.
Official	147	3.7	35	([3])
Southern	2,120	53.2	[4]2,307	3.1
Western Trunk Line	1,450	36.3	72,000	96.7
Southwestern	200	5.0	......	....
Mountain-Pacific	71	1.8	[7]117	0.2
United States	3,988	100.0	74,459	100.0

[1] Computed from text of The Mineral Reserves of the United States and its Capacity for Production, op. cit., pp. 97–111.

[2] In certain cases the tonnage unit is not specified but it has been assumed in those cases that long tons were intended.

[3] Less than 0.05%.

[4] Large reserves of nonavailable ore for which no estimate has been made are located in Alabama.

[5] Large quantities of nonavailable ore for which no estimate has been made are located in Wyoming, Arizona, Nevada and other states.

Copper

In 1934 Percy Barbour estimated the total copper reserves of the United States mineable at 10 cents per pound of metallic copper to be 30 to 35 million tons with perhaps an additional 3 or 4 million tons mineable if the price were 12 cents. These figures were equivalent to a forty years' supply based upon the last ten-year average rate of consumption. As estimate made the following year in connection with the Arizona tax legislation by Joralemon, Lynch and Leith was 26,122,000 tons mineable at or below 12 cents. According to their trend predictions, this supply would last for some 32 years based on a production rate of 725,000 tons per annum. Leith and Liddell in their report for the Resources Committee estimate 26,390,000 tons as the total [fol. 5519] metallic copper in the reserves.[1] This figure, however, included 110,000 — of Alaska copper belonging to Kennecott, now exhausted according to information from the Bureau of Mines, and 14,100 tons of Arizona copper of the United Verde Extension group also now exhausted. If we adjust the total for these differences, the reserves would aggregate slightly in excess of 26 million tons without allowance for depletion other than that represented by the exhaustion of the two areas referred to above.

---

[1] The Mineral Reserves of the United States and its Capacity for Production, op. cit., pp. 55 ff.

On this basis the distribution of the reserves as between the freight rate territories would be as follows:

Reserves of Metallic Copper, by Freight Rate Territories, 1936

Territory	Tons	% of U. S.
Official	...	...
Southern	120,000	0.5
Western Trunk Line (Mich.)	335,000	1.3
Southwestern	...	...
Mountain-Pacific	24,884,000	98.2
Total	[1]25,339,000	100.0

---

[1] Does not include 800,000 tons of copper in mines whose location is not shown in the table.

Source: The Mineral Reserves of the United States and its Capacity for Production, op. cit., p. 56.

Lead and Zinc

The production of lead and ~~zinc are~~ closely interrelated as are the economics of the two metals. Only about one-third of the lead produced in the United States comes from [fol. 5520] mines whose sole production is lead. The balance is produced in association with silver, copper, gold, or zinc. Zinc, moreover, is also a by-product to perhaps a greater extent than any other nonferrous base metal. Profitable production of either lead or zinc, therefore, is or may be to a considerable extent dependent upon prices of other metals with which either or both may be associated. In the case of both metals there are also important bodies of sub-ore or sub-marginal ore which may be affected by the price changes of any one of the nonferrous metals more or less frequently associated with lead and zinc. In two of the most important lead districts, the Southeastern Missouri and the Tri-State fields, the boundaries of the ore bodies grade into sub-ore both in tenor and thickness so that an increase in the price of the ore automatically extends the area of profitable ground. Zinc probably has more sub-marginal reserves than most nonferrous metals. Until the perfection of the flotation process many zinc reserves were uneconomical. Since then the flow of metal has not only kept down the price but in several cases has caused developed zinc tonnages to remain idle.

According to the Leith and Liddell report for the Resources Committee the measured and published lead ore reserves were 3,302,158 short tons of metallic lead. Finlay in 1934 believed it difficult for the four most important districts, Southeastern Missouri, Coeur d'Alene, the Tri-State (Kansas, Missouri, Oklahoma), and Utah fields, to produce more than 8 and the whole country more than 10 million tons. Leith and Liddell's conclusions regarding lead were that "our reserves are not large and we will probably have a deficiency of this metal within this or the next generation."[1] Also according to these authorities, the measured and estimated reserves of zinc in the important mines of the country aggregated 12,167,580 short tons of metal mineable at prices around the 4 to 6 cent range (1936).

Both the lead and zinc reserves of the most important mines and districts were shown in the Leith-Liddell tables and from these tables the ore reserves have been distributed by freight rate territories.

Except for Southern territory which shows very small reserves of either metal, all the other freight rate territories possessed important reserves of either lead or zinc [fol. 5521] or both. The Mountain-Pacific and Western Trunk Line territories are the most important sources of reserves of lead with 37 per cent and 51 per cent, respectively. Southwestern territory leads in zinc reserves with 37 per cent followed by Official territory with 24 per cent and Mountain-Pacific territory with 22 per cent of the national total.

Table 3.—Lead and Zinc Reserves, by Freight Rate Territories, 1936 [1]
(Short tons)

Territory	Lead	Zinc
Official	85,000	2,940,000
Southern	90,000	510,000
Western Trunk Line [1]	1,696,440	1,516,800
Southwestern [1]	193,560	4,483,200
Mountain-Pacific	1,237,158	2,713,580
Total	3,302,158	12,163,580
Percentage of total		
Official	2.57	24.17
Southern	2.73	4.19
Western Trunk Line [1]	51.37	12.47
Southwestern [1]	5.86	36.86
Mountain-Pacific	37.47	22.31
Total	100.00	100.00

[1] Compiled from Leith and Liddell, The Mineral Reserves of the United States and Its Capacity for Production, op. cit., p. 243, except that Tri-state lead figure is divided 9.22 percent, Kansas; 16.13 percent, Oklahoma; and 74.65 percent, Missouri, according to production in 1929, Bureau of Mines Mineral Yearbook, 1929, Part I, p. 236. Zinc figure divided 25.28 percent, Kansas, and 74.72 percent, Oklahoma, same Yearbook, p. 678.

[fol. 5523]

Minor Metals

Estimates of reserves of metals other than iron, copper, lead, and zinc are not available in such form that they can be presented by freight rate territory totals. The distribution of commercial deposits of certain minor metals, however, is indicated by Table 3-A which shows the value produced in 1939. This table shows that Mountain-Pacific territory is the outstanding producer of all of the minor metals for which state figures were reported, excepting only manganese and bauxite. Western Trunk Line territory appears to be the leader in manganese production, although no definite conclusions can be drawn because of the large portion of the value produced which is not distributed by states. Southwestern territory is the principal producer of bauxite.

The five states divided by freight rate territory boundaries were arbitrarily allocated to territories as follows: Michigan to Official, Wisconsin to Western Trunk Line, Virginia to Southern, Louisiana to Southwestern, and Colorado to Mountain-Pacific territory. No figures were computed for an alternative grouping of states, as has been done in certain other sections of this report, but the figures for the five states in question are presented in Table 3-B and an inspection of this table will reveal that a different grouping of the states would have produced essentially similar results.

[fol. 5524]

Non-Metallic Minerals

As was indicated previously in this report, certain of the non-metals (sand and gravel, limestone, etc.) are so generally distributed that estimates of reserves seemed not to be important. In order to give an indication of the importance of these resources to each of the territories, however, figures were compiled for the value of non-metals or production thereof sold or used by producers in 1939. In certain cases, as indicated by Table 3-C, the figures represent sales only, or in other cases, shipments only, and consequently are not exactly comparable. They indicate in general, nevertheless, the relative significance, in terms of value, of the various non-metals. The last three items in the table (Portland cement, lime, and salt) all require some processing for a considerable portion of their production, but are included in the mineral production data because they are reported with other non-metals in the Bureau of Mines Yearbook.

Portland cement, the most important non-metal from the standpoint of value shipped in 1939, is produced principally in Official territory, followed in order of importance by Mountain-Pacific and Western Trunk Line territories. There is only a small production in Southern and Southwestern territories. Official territory also leads in limestone and sand and gravel, the next two minerals in order of importance. Southern and Western Trunk Line territories view for second place in the production of limestone and Mountain-Pacific territory ranks second in the production of sand and gravel. No other non-metal (for which figures were available) accounted for over 36 million dollars of value sold or used in 1939.

Altogether, Official territory ranks first in limestone, sand and gravel, fire clay, slate, basalt, sandstone, gypsum, talc, Portland cement, lime, and salt. Southern territory ranks first in granite, gaolin, ball clay, fuller's earth, marble, phosphate rock, fluorspar, and crude feldspar. Western Trunk Line ranks first in barite, Southwestern territory first in sulphur, and Mountain-Pacific territory first in bentonite, miscellaneous clay, and miscellaneous stone.

2/ Output of Government-and-contractor operations included under "Undistributed".
3/ Included with Tennessee. Total of the two states - $3,856,505.
4/ Not available by states.

Source: Minerals Yearbook, 1940.

[fol. 5529] In order to check these rankings of the territories on a value basis, actual quantities sold, used, or shipped were compiled for all those non-metallic minerals having a value greater than 5 million dollars in 1939. These figures, which are presented in Table 3-E, indicate that the rankings of the major items is the same when quantities, rather than values, are compared.

Only one grouping of the states divided by freight rate territory boundaries has been presented, in which Michigan was assigned to Official, Wisconsin to Western Trunk Line, Virginia to Southern, Louisiana to Southwestern, and Colorado to Mountain-Pacific territory. Figures for the five states are listed separately in Tables 3-D and 3-F so that the total effect of a reclassification of states may be computed.

Secondary Metal Reserves

Characteristics and Significance of Secondary Metal Reserves

No discussion of the distribution of the primary reserves of iron and nonferrous metals by freight rate territories can be regarded as complete without some consideration being given to the secondary reserves of these metals. In the case of iron and steel, copper, and lead, the extensive recovery of these metals in secondary form greatly affects the volume of production of the virgin metal and thereby tends to prolong the life of the existing reserves of these metals in the form of ore. Pehrson, Acting Chief of the Economics and Statistics Branch of the Bureau of Mines, speaking in 1938 with regard to the Bureau of Mines' figures, stated that "The record shows that from 1907 to 1936, inclusive, approximately 9,000,000 tons of copper, 5,000,000 tons of lead, 3,500,000 tons of zinc, 635,000 tons of tin, and 682,000 tons of aluminum have been reclaimed from various cycles of use." [1]

Table 3-C. - Value of Non-Metals Sold or Used by Producers, by Freight Rate Territories, 1/ 1939 (Continued)

1/ States divided by freight rate territory boundaries were apportioned to territories as follows:

Michigan - Official territory
Wisconsin - Western Trunk Line territory
Virginia - Southern territory
Louisiana - Southwestern territory
Colorado - Mountain-Pacific territory.

For figures for these five states, see Table

2/ Includes Puerto Rico.
3/ Includes Hawaii.
4/ Includes commercial production of Alaska.
5/ Includes $174,144 of diaspore and burley clay in Missouri.
6/ Value represents value shipped and is distributed to territories on the basis of production (99% and 1%). Figures do not include sulphur recovered as a by-product.
7/ Includes Puerto Rico and Alaska.
8/ Includes Puerto Rico and Hawaii.

Source: United States Department of the Interior, Bureau of Mines, "Minerals Yearbook," 1940, Washington: Government Printing Office, 1940.

[fol. 5533] Over a period of scores of years the processes of production have built up large reserves of some metals in the form of the various finished products into which they enter. Some of these reserves are, of course, subject to serious depletion in use. Just as mine losses reduce the supply of metal obtainable from ore, so are the reserve stocks of metals represented in durable goods in the hands of consumers subject to depletion. Up to the end of 1932 Ingalls estimated that the total deliveries of copper for consumption aggregated 20 million tons, of which 2.9 million tons had been exported, leaving 17.1 million tons for domestic consumption. As of the end of 1932 he was able to account for only 10.1 million in the inventories of metal in use, leaving a total of 7 million tons as lost.[1]

In the case of iron and steel an immense tonnage is lost in every year through rusting.[2] Much of the lead and copper that go into bearing metal may be assumed to be lost by dissipation through wear. Ingalls estimated that for railway equipment there are about 200,000 tons of copper in journal bearings and bushings in the form of copper-lead-tin-bronze alloy containing about 75 per cent copper. Every year about 80,000 tons of this has to be replaced and every year the junk amounts to around 60,000 tons leaving about 20,000 tons of loss by wear or otherwise to be replaced.[3] Other losses occur through similar or other forms of dissipation. White and red lead for pigment, and tetraethyl for tempering gasoline are lost by dissipation and the same is true of copper used for oxides and sulphates.[4] Another important source of loss is what may [fol. 5534] be termed the dispersing uses of many of these metals. In a chemical sense, for example, copper is an indestructible metal but in a mechanical sense the scattering of many of the articles in use is so extensive that recollection as secondary metal is impracticable. This is true, for example, of the copper in pins and fastenings, rivets, machine and wood screws, bolts, and nuts, spark plugs, incandescent lamp bulbs and sockets, drapery, hardware, harness, and saddlery hardware, domestic ornaments and utensils, buttons, badges and a host of other small articles.[1]

[2] Ibid, p. 92.

[3] Ibid, p. 78

[4] Ibid., pp. 78 and 86.

Zinc is much more susceptible to losses of these types than copper and so also is tin. The principal uses of zinc are for galvanizing, brass making, die casting, oxides and sheets. Sheets in turn are used chiefly for battery cans and fruit jar tops. All of these products except brass and die casts are put to essentially dissipating or dispersing uses.[2] Aluminum "like copper experiences some dissipating and dispersing uses of different degrees. So far as we can go in the analysis of conditions in aluminum this metal appears to follow the habits of copper."[3]

Information regarding the size of these secondary reserves of metals is exceedingly scanty. About the only available figures which are compiled in any degree of detail are those for iron and steel. At least one estimate for copper given above has also been made. For the other metals no estimates have been attempted. In the following pages, however, the readily available data on the relative impor- [fol. 5535] tance of primary and secondary production of iron and steel and the principal nonferrous metals have been assembled together with information bearing on the probable distribution of these secondary reserves by freight rate territories.

Importance of Secondary Ferrous Metals

Estimates of the reserves of iron and steel represented in products in use in the United States in 1936 aggregated in excess of one billion tons or more than 17,800 pounds per capita. From 1900 to 1930 the amount of steel in use grew steadily at an average rate of about 440 pounds per capita per year. During the depression there was a substantial decrease in this rate of accumulation and in fact in 1932 there was a net decline. After that year, however, the increase was resumed at the lower rate of 300 pounds per capita per annum, although in 1935 it was 507 pounds.[1] By 5-year periods 1903-1937 iron ore consumption per ton of steel produced has declined uninterruptedly from 1.5305 tons in the first quinquennium to .9353 tons in the last.[2]

---

[1] Ibid., p. 78. The larger part of the loss, according to Pehrson, "is probably copper used in the fabrication of small articles that have become so widely dispersed in use that their collection is unprofitable." E. W. Pehrson, Conservation Aspects of Secondary Metals, Address at Annual Convention of the National Association of Waste Material Dealers at New York, March 15, 1938, p. 3 (mimeographed).

[2] Ingalls, op. cit., p. 88.

[3] Ibid., p. 86.

In the five years 1910-1914 the percentage ratio of the consumption of iron and steel scrap to steel production never rose as high as 52 per cent. Between 1920 and 1937 the ratio has never been below 60 per cent, and between 1925 and 1937 never below 65 per cent, and between 1931 and 1937 never below 70 per cent.[3]

The scrap represented in these figures includes both plant scrap originating in the steel plants and in the processes of steel production and which is continuously being recycled in such plants and scrap which is purchased by the steel companies. Purchased scrap includes both new scrap originated by manufacturer of products using steel, i.e., automobiles and used or old scrap originating from a wide variety of sources. The division of total scrap between "plant" or "home" scrap and "purchased" or "other" scrap has been approximately half and half in recent [fol. 5536] years.[1] However, not all of the purchased scrap represents drafts on the secondary metal reserves. This is because plants engaged in the production of iron and steel products, notably the automobile industry, originate vast quantities of new scrap which are sold and returned to the steel furnaces each year.

[2] Report of the Interstate Commerce Commission to the President of the United States on Certain Aspects of the proposed Lake Erie-Ohio River Canal, 235 I.C.C. 798, Table 5.

[3] Table 6, ibid., p. 799.

[1] In 1937 home scrap was 27.6 per cent of the total ferrous scrap and pig iron consumed in the United States, and purchased scrap 25.2 per cent. In 1938 the percentages were 28.4 and 25.2, respectively. Minerals Yearbook, 1939, p. 515.

The Bureau of Mines reported to the Military Affairs Committee of the Senate in 1937 that "The reservoir of iron in use in this country from which our annual scrap supply is withdrawn, is enormous. * * * Moreover, the amount of metal added to the reservoir in that year (1937) was considerably more than that withdrawn. It may be conservatively estimated that, in 1937, 35,000,000 tons of steel products were added to the store of metal in use, whereas the total scrap withdrawn for domestic consumption and for export probably did not exceed 25,000,000 tons. Thus, in a year of unprecedented scrap exports our reservoir of potential scrap was actually increased by 10,000,000 tons."[2]

Importance of Secondary Nonferrous Metals

The Ingalls figure quoted above of 10 million tons of copper in use in 1932 is about the only figure of secondary reserves for any of the nonferrous metals. As already pointed out, therefore, indications of the importance of secondary reserves of these metals must be gleaned from the figures of secondary production in comparison with the primary production or imports where there are no reserves. Table 4, therefore, presents by three-year periods from 1914 the primary and secondary production of copper, lead, zinc, and aluminum and the secondary production and imports of nickel and tin.

[fol. 5537] II-20

Over the entire period of 26 years secondary copper shows the highest ratio to primary production (58.24 percent). Lead and aluminum are about equal with between 41 and 42 percent and zinc is lowest with only 34 percent. In terms of tonnage, secondary aluminum, production is not of great importance at the present time possibly because the use of aluminum in large quantities is comparatively recent and sufficient time has not been allowed for the accumulation of large quantities of scrap.

---

[2] Statement of Bureau of Mines on the Proposed Embargo on Exports of Iron and Steel Scrap, Hearings before a Subcommittee of the Senate Committee on Military Affairs on S. 2025 and S. J. Res. 180 (Scrap Iron and Steel), 75th Cong., 1st Sess., 1937, p. 79.

Although we have practically no tin or nickel ore reserves,[1] supplies of secondary metal are of some importance and should perhaps be considered in any estimate of resources. While the ratio of secondary nickel to imports at 8.55 percent for the period is the lowest of the ratios shown by Table 4, the secondary tin figure of 35.80 percent of imports is about the same as the relation of secondary to primary zinc production. For copper, aluminum and lead it would appear that secondary metal is assuming a greater and greater importance. For zinc, tin, and nickel there is less, if any, such indication. These apparently different tendencies are accounted for, of course, chiefly by differences in the character of the consumption of the various metals with resulting differences in the rates of recovery or recycling of the metals as well as in what proportion of the total volume going into consumption can ultimately be recovered.

---

[1] Regarding tin, "The country * * * has been able to produce only an average of 7 tons per year for the last 15 years as compared to the average imports of 70,000 tons per year." "There has been no nickel ore mined within the boundaries of the United States since 1909 * * * if strong efforts were made * * * without regard to price or commercial availability perhaps 2,000 or 3,000 tons of metallic nickel in ore could be produced. This opposed to a probable consumption of about 19,000 tons per year * * * is not important." (Leith and Liddell, op. cit., pp. 219, 172).

Table 4. Relation of Nonferrous Secondary to Primary Metal Production or Imports, Three-year Averages, 1914-1939

[fol. 5540] II-23

Much of the secondary metal represented in these figures does not constitute any contribution from the secondary metal reserves but consists of "home" or "run around" scrap. In other words the processes of production of machinery, equipment and other articles, produce a certain amount of scrap in the form of clippings and cuttings, borings, skimmings, spinnings, and sweepings, the quantity of which in each year varies directly with the volume of production. Manufacturing scrap of this character is principally and usually new scrap and is constantly recycled. Except for the fluctuations in its total volume each year this scrap possesses little or no economic significance. Old scrap, on the other hand, comes from the reserves of metal in use. For this reason ratios of old scrap to primary production are of greater significance than are those of new scrap and it is these reserves of old scrap with which this study is concerned.

Until recently no attempt has been made to separate the consumption of old scrap representing drafts on the secondary reserves of metal in use from those of new scrap which may be said to constitute a more or less permanent part of the nation's manufacturing inventory. Unfortunately only a beginning has been made on the collection of data on old and new scrap except copper. For 1939, however, the Bureau of Mines has made a separation for each of the principal nonferrous metals under consideration. These figures are shown in Table 5 in comparison with the primary production of copper, lead, zinc, and aluminum and with imports in the case of nickel and tin. The figures for the single year are, of course, apt to be misleading.

As already stated, the volume of new scrap is chiefly manufacturing scrap, which fluctuates directly with the volume of industrial production. The volume of old scrap appearing in the market in any year, however, is influenced by the price of scrap and consequently may not be so directly related to the volume of production. The figures for only a single year, therefore, may indicate a degree of importance for either old or new scrap with reference to the primary production which would not be borne out by the figures for a longer period. It will be noted, for example, that the ratio of old copper to primary production, for the 5-year period 1934-1938 greatly exceeds that for the single year 1939 when there was a sharp rise in the production of primary with consequent increase in the proportion of new scrap to the total. In that year, [fol. 5541] therefore, the ratio of old scrap to primary production was less than 41 percent as compared with 66 percent on the basis of the average for the preceding five years.

Except for zinc, aluminum, and [illegible]kel, the tonnages of old scrap are fairly impressive an[illegible] would indicate that the secondary reserves of old metal [illegible]e highly important to industry.

The foregoing ratios of old scrap to primary production or imports are explainable very largely in terms of the purposes for which these various metals are consumed and the character of this consumption taken in connection with certain other statistical data sheds some light upon the location of these secondary metal reserves.

(Here follows 1 Photolithograph side folio 5542)

[fol. 5543] *Relation of Metal Consumption to Growth of Secondary Reserves*

Copper

Table 6 shows the average consumption of copper, 1934-1938, by uses. Five sources of consumption accounted each for in excess of 9 percent of the average consumption of copper in the 5 years 1934-1938, electrical manufactures (23.22 percent) automobiles (13.32 percent), other rod and wire[1]. (10.45 percent) light and power lines (9.49 percent) and buildings (9.04 percent). These uses, therefore, accounted for nearly two-thirds (65.52 percent) of the total consumption. Most of this copper is recoverable. in addition, it is probable that the great bulk of the copper going into telephones and tellegraphs (4.06 percent) is recoverable and much, if not most, of that used in shipbuilding and railway equipment. There is a large recovery from radio sets, air conditioning equipment, radiators, and refrigerators. Most of the copper in "castings (n.e.s.)" ammunition, and a large proportion of that in miscellaneous other uses is definitely nonrecoverable because of dissipation, dispersion or both.[2]

---

[1] See note 3 to table.

[2] The above figure of 65.52 percent of the copper going into consumption in 1934-1938 from which high proportions of recovery are likely may be compared with the Ingalls estimate quoted above. It will be recalled that he estimated that 17.1 million tons had gone into domestic consumption, of which 10.1 tons were in use and 7 million had been lost up to the end of 1932. This is a ratio of a trifle over 59 percent in use as compared with a little over 40 percent lost. If we allow something for recovery from other than the five principal uses specified above and for losses in the five principal use- and highly recoverable groups it would appear that the proportion of copper going into secondary reserves in the five years 1934-1938 may not perhaps be very far from the Ingalls estimate to the end of 1932.

Table 5.--Relation of Secondary Production from New and Old Scrap to Primary Production from Domestic Ores or Imports of Principal Nonferrous Metals

Metal	Primary production of imports	Secondary production			Percent of primary production or imports		
		New scrap	Old scrap	Total	New scrap	Old scrap	Total scrap
	(Short tons)	(Short tons)					
	Production from domestic ores						
Copper, 1939	704,873	212,800	286,900	499,700	30.19	40.70	70.89

Other uses [10]	55,280	8.50
Manufactures for export	34,160	5.25
Total	650,340	100.00

Source: Minerals Yearbook, 1939, p. 106.

[1] Generators, motors, electric locomotives, switchboards, light bulbs, etc.

[2] Transmission and distribution wire and busbars; accounting only for the public-utility companies.

[3] Includes industrial wire and cable, wire in buildings, railway cars and ships, radio broadcasting, railway and municipal signaling, railway electrification, trolley wire, rod and wire for Government projects, blasting wire, flexible cord, and sundries.

[4] Does not include starter, generator, and ignition equipment.

[5] Excludes electrical work.

[6] Bearings, bushings, lubricators, valves, and fittings.

[7] Includes air conditioning.

[8] Excludes electrical equipment.

[9] Other than railway.

[10] Includes condenser tubes, oil-burner tubing, welding rod, screw-machine products, nickel-silver and phosphor bronze products, rivets and burrs, toilet pins, eyelets and grommets, electrotyping and engraving sheet, spark plugs, inner-tube valve stems, jar tops and rouge boxes, flashlight tubes, kerosene lamps, kitchen utensils, kitchen-range boilers, linotype matrices, safety razors, blasting caps, asbestos textiles, water meters, thermostats, soldering coppers, yacht fittings, coinage, washing machines, household water heaters, fire extinguishers, etc., all reckoned in terms of copper content.

[fol. 5545] These use characteristics of copper combined with its highly indestructible character physically account, no doubt, for the large tonnages of old scrap going into consumption each year.

Lead

During the five years 1934-1938 approximately 31 percent of the total lead consumed in the United States was used in storage batteries (Table 7). Ingalls, speaking in 1935, concluded that "the 24 million automobiles that we have on the road carry about 300,000 tons of lead" in the form of battery plates. "From the number of automobiles we have on the road, the average battery weight and the average battery life," he calculated that "we ought to get back 110,000 tons of lead per annum."[1]

Next to battery lead the most important source of secondary lead is said to be cable scrap,[2] a use which accounted

---

[1] Ingalls, op. cit., pp. 86-88. Certain other estimates have been very much higher. In the nonferrous metals cases F. R. Wampler estimated that on December 1, 1929, there were 26,501,443 automobiles registered in the United States with an average battery lead weight of 25 pounds—a total of 357,769 tons of battery lead. This witness figured that the average life of a storage battery was 18 months and that approximately 238,000 tons of automobile battery plates were annually subject to recovery. Record, Rate Structure Investigation, I. C. C. Docket 17,000, Non Ferrous Metals, Part 12, p. 3960. Even on the 18-month basis, this last figure is probably much too high. Thus it was also testified in the same case that the lead yield on burnt out battery plates was from only 65 to 70 percent "the remainder being non-reclaimable and worthless." (Sidney R. Lewis, ibid., p. 4819). And information from the Bureau of Mines would indicate that recovery at the present rate would not exceed 80 percent. Also at the present time a life of 18 months may well be too low for the average of all batteries.

[2] Ingalls, op. cit., p. 87.

[fol. 5546]

Table 7.—Lead Consumed in the United States, by Use, Average 1934-1938

Use	5-yr. average (Short tons)	Percent of total
White lead	77,400	13.41
Read lead and litharge	48,700	8.44
Storage batteries	177,600	30.78
Cable covering	57,100	9.90
Building	36,600	6.34
Automobiles	9,280	1.61
Railway equipment	1,800	.31

Solder	19,000	3.29
Type metal	14,800	2.56
Calking	12,500	2.17
Castings	5,550	.96
Other uses	44,200	7.66
Total	577,030	100.00

Yearbook of the American Bureau of Metal Statistics, 1938, p. 56. These estimates are for the total consumption of lead irrespective of whether its origin is primary or secondary. Antimonial lead is included.

[fol. 5547] for less than 10 percent of the average consumption of lead in the five-year period 1934-1938. However, Ingalls in 1935 believed that a national inventory of lead in use would show the largest quantity to be in cables.[1]

The only other purposes which absorbed in excess of 5 percent of the total in this quinquennium were in buildings (6.34 percent), in white lead (13.41 percent), red lead and litharge (8.44 percent), and ammunition (5.80 percent).

As indicated above, battery scrap is a very important source of secondary lead. Lead in buildings is already recoverable as is also lead in cables and much of that going into minor channels of consumption for solder, automobiles, railway equipment, shipbuilding and type metal. Lead used for white and red lead and litharge is practically all dissipated as is also a good deal of that in bearing metal as a result of abrasion. Lead in ammunition is presumably almost entirely lost through dispersion as is also much of that represented in terne plate, foil, and collapsible tubes.[2] The high ratio of old lead scrap to primary production in 1939, therefore (Table 5) is due primarily to the volume of battery scrap. Its elimination from the old scrap figures would, no doubt, reduce this metal from leadership in the ratio of old scrap to primary production to a position substantially below copper.[3]

---

[1] Ingalls, op. cit., p. 87.

[2] Ingalls, op. cit., p. 86.

Zinc

The two most important uses of zinc are for galvanizing and brass making. On the basis of the five-year average for the years 1934-1938 the former absorbed about 42.5 [fol. 5548] percent of the industrial zinc used in the United States and the latter not quite 27 percent (Table 8). Most of the recovery of zinc from brass is not in the form of zinc but as brass, the zinc content of which replaces a corresponding amount of spelter which would otherwise go into brass making. Other important uses are for die casting (12.10 percent) and in rolled zinc (10.50 percent).

Zinc consumption in die casting has grown to an average of 59,100 tons per annum for the five years 1934-1938 from only 13,500 tons in 1926, the first year for which this use was separately reported by the Bureau of Mines.[1] In 1935 die castings absorbed 73 percent more zinc than in the preceding year[2] and in 1937 the consumption was more than 2½ times that of 1934.[3] This abrupt increase reflected a marked increase in zinc used by the automobile industry where zinc castings are used in a great variety of parts—hardware, carburetors, fuel pumps, radiator grilles. Some 1936 models contained as much as 80 pounds of zinc die castings.[2] Die casting industry estimates of 1941 consumption made late in 1940 were 155,000 tons.[4]

As compared with either copper or lead, relatively high proportions of zinc go into nonrecoverable uses and of the secondary zinc that is recovered, according to Ingalls, there is but little reconversion into spelter.[5] A very substantial part of the zinc ore produced in the United States is used directly in the manufacture of pigments and chemicals from which there is pratically no recovery. Thus the 42.5 percent of the zinc used for galvanizing in 1934-1938 is widely dispersed and there is little or no recovery therefrom.

---

[3] Cf. Ingalls' conclusion (op. cit., p. 88) that "If we eliminate the storage battery cycle the reflux of old lead from use appears to be less in terms of percentage than in the instance of copper. If on the basis of 1929 consumption the reflux of old copper was something like 18 percent; that of old lead may have been about 8 to 10 percent."

Rolled zinc	51,280	10.50
Die castings	59,100	12.10
Other uses [2]	38,600	7.90
Total	488,380	100.00

Source: Yearbook of the American Bureau of Metal Statistics, 1938, p. 76.

[1] Includes pole-line hardware, hollow ware, chains, and all articles not elsewhere mentioned.

[2] Includes slab zinc used for manufacture of French oxide, zinc for wet batteries, slush castings, the desilverization of lead, and sundries.

[fol. 5550] Rolled zinc is utilized chiefly for such products as battery cans and fruit jar tops,[1] which are also highly dispersing. As a result of this situation, the secondary reserves of zinc are relatively small as compared with those of copper or lead and the chief source of secondary metal is new scrap.[2] This is indicated by a comparison of the figures of old and new scrap from the various nonferrous metals in 1939 (Table 5). In that year old copper, lead, and aluminum scrap either substantially or greatly exceeded new scrap, the ratios of old scrap to the total old and new scrap being, respectively, 57.41, 87.29, and 69.80 percent. In the case of zinc, on the other hand, the volume of new scrap greatly exceeded the old, the latter representing only 23.78 percent of the total of both old and new.

[2] E. W. Pehrson, at the Twenty-Third Annual Convention of the National Ass'n of Waste Material Dealers, Inc., quoted in Minerals Yearbook, 1936, Part II, p. 350.

Tin

There is every indication that there are no important reserves of secondary tin and that the great bulk of it represents merely run-around scrap recovered from industrial plants.[3] "Among all the nonferrous metals tin is pre-eminently the one that is associated with the production of consumption goods rather than of constructional or durable goods."[4] About 40 percent of the consumption of the United States is in tin plate (Table 9) and Ingalls estimated in 1935 that about 75 percent of the tin plate was used for canning. Old tin cans and tin plate are primarily dissipating and dispersing uses. The next most important

[1] Includes small quantity of pig tin derived from detinning operations; Bureau of Mines not permitted to publish separate figures.

[2] Small quantity included under "Miscellaneous."

[3] In 1935 pure tin tubing required 940 tons and tin-lined tubing 13 tons; in 1936, 1,476 and 7 tons, respectively; in 1937, 1,286 and 10 tons, respectively; not reported separately after 1937.

[fol. 5552] use of tin is in solder, which is also largely scattered. All the chemical uses are essentially dissipating.

---

[3] E. W. Pehrson and John B. Umhau, Minerals Yearbook, 1939, p. 679. Also Ingalls, op. cit., pp. 89-90.

[4] Ingalls, op. cit., p. 89.

Collapsible tubes and foil are largely scattered and babbitt metal wears out. The principal reclamation, according to Ingalls, is from solder and this chiefly from automobile radiators.[1]

Bronze is apparently another source of secondary tin. About 60,000 tons of bronze junk are returned annually from journal bearings and bushings.[2]

In view of these conclusions of competent students, it is of some interest, therefore, to note that despite this fact the old tin scrap represented a substantially higher proportion of the total scrap than did new scrap in 1939, the only year for which we have separate figures of old and new scrap. According to the Bureau of Mines this is due largely to the tin circulating in bronze scrap.

Aluminum

As pointed out above, Ingalls has suggested that the reflux of aluminum is similar to that of copper. This implies that in contrast to zinc and tin most of the production goes into use in those industries which sooner or later return all or part of it in the form of scrap. The data on aluminum consumption by industries is exceedingly scanty but for 1936 and for the period 1933-1938 the Bureau of Mines has published estimated proportions of primary aluminum consumed by various industries. The figures are as follows:

[fol. 5553]

Table 9A.—Uses of Aluminum

Use	1936 [1] (Percent)	1933-1938 [2] (Percent)
Transportation (air, land, water)	20	29
Machinery	18	15
Cooking utensils	13	14
Miscellaneous foundry and metal working	13	4
Electrical conductor	12	10
Iron and steel metallurgy	5	5
Chemical	3	5
Building	3	8
Food and beverage	...	6
Miscellaneous, including food products	13	...
General miscellaneous	...	4
	100	100

[1] Ibid., pp. 78, 90.

[2] Letter dated December 4, 1940, from E. W. Pehrson, Acting Chief, Economics and Statistics Branch, U. S. Bureau of Mines, Dr. W. H. S. Stevens, I. C. C.

On their face those figures would appear to support the Ingalls theory and to indicate the accumulation of substantial secondary reserves of metal. Presumably the chemical use, the miscellaneous uses, including food products, and iron and steel metallurgical consumption are definitely dissipating. These uses, however, combined add up to only about 20 percent of the total shown, assuming there was no recovery from any of them. On the other hand, considerably over half of the total is consumed in the machinery, transportation, electric conduction, and building industries from which recovery is quite large. Recovery from cooking utensils is of a high order too.[3] It has been stated officially that the Aluminum Company of America estimates "that 60 to 75 percent of the original ingot eventually reappears as secondary aluminum."[4] For some of these products re- [fol. 5554] covery may be complicated by the fact that the aluminum used goes into the product produced in the form of alloys. For the 10 years 1927-1936 secondary supply of aluminum was 32 percent of the total domestic supply whereas secondary copper was 43 percent of total domestic consumption of copper.[1] The difference may be due to the fact that aluminum is a new metal as compared with copper. Supporting this view, the Federal Power Commission stated in 1938 that the situation "suggests that the amount of secondary aluminum will increase slowly for perhaps 10 years, more rapidly thereafter."[1]

Nickel

Figures on the quantities of nickel going into various uses are not available. World figures in a pamphlet by Robert Stanley, "The Nickel Industry in 1937" published by the International Nickel Company would indicate that the bulk of it is used in conjunction with other metals. According to his figures, 55 percent of the total was used in nickel steels. Monel, malleable nickel, nickel clad, and Iconel absorbed 12 percent and electro deposition 10 percent. Nickel alloys accounted for most of the balance. The 1939 figures (Table 5) do not indicate that there are at present significant tonnages of secondary metal accumulating.[2] No further consideration, therefore, is given to this metal in this study.

[fol. 5555] *Reserves of Secondary Metals by Freight Rate Territories*

Information regarding the location of these secondary metal reserves and their relative importance as between different freight rate territories is of the most fragmentary character. A limited amount of information on rail movements of scrap is available in Interstate Commerce Commission figures. Various other statistics collected from miscellaneous sources which are separable according to freight rate territories also shed some light on the relative proportions of the secondary metal reserves available in the different freight rate territories. These statistics constitute about the only available information with regard to the probable location of the secondary metal reserves.

Secondary Metal Reserves in Buildings

In the five years 1934-1938 (6-year period for aluminum) the building industry absorbed the following percentage of iron and steel and the four principal nonferrous metals.

Table 10.—Proportion of Consumption of Specified Metals in Building, 1934-1938 [1]

Metal	Proportion
Iron and steel (structural shapes)[2]	8.33
Copper	9.04
Lead	6.34
Zinc	—
Aluminum	8.00

---

[2] Up to the end of the World War, however, the chief use of nickel was for armament purposes. It is only during the last 20 years that there has been any very serious effort to adapt the unique properties of nickel to peace time uses. Minerals Yearbook, 1938, pp. 552-553.

[fol. 5556] No entirely satisfactory figures of the number of structures for the United States are available by states and even if they were, the number alone would not be an entirely satisfactory index of the volume of such metals in such buildings owing to the great differences in size of the units involved. However, the number of establishments is available by states for the manufacturing industry and from these and other figures also available on a state basis it is possible to piece together some rather definite ideas as to the probable distribution of the secondary metal reserves in buildings by freight rate territories. As the number of manufacturing establishments gives no indication of the sizes involved, the average number of wage earners employed in manufacturing in 1937 has been shown for each freight rate territory as a check on the establishment figures. For hotel structures the number of rooms by rate territories has been taken to indicate the extent of metallic reserves available in this type of structure and the number of family units has been used as a similar indicator of the number of dwelling units and the proportion of metal included in such structures. For the relative importance of metallic reserves located in business structures other than hotels and manufacturing establishments, such as office buildings, warehouses, wholesale and retail establishments, and the like, the number of people gainfully employed in clerical occupations and in trade has been used. Tables 11 and 12 show the distribution of these figures by freight rate territories. Two groupings of states have been used for the freight rate territories since these territories do not follow state lines. These groupings are sufficiently indicated in the footnotes to the table.

These figures would suggest that in excess of 45 per cent of the secondary metallic reserves of iron and steel, copper, lead, zinc, and aluminum in buildings are located in Official territory. Leadership for the remaining territories depends primarily on the kind of structure. Mountain-Pacific far exceeds the others in terms of hotel rooms as indicative of secondary metal reserves in hotel buildings, followed by Western Trunk Line, Southern, and Southwestern. Though Western Trunk Line leads in number of manufacturing establishments, Southern leads in the number of

[fol. 5559] manufacturing wage earners, and it may be conjectured that somewhat larger reserves of metal are probably to be found in Southern territory. Southwestern territory is definitely lowest in both respects.

Gauged by gainfully employed in clerical occupations and trades, there are more secondary metal reserves in Western Trunk Line business structures, outside of manufacturing establishments and hotels, than in any territory other than Official. Mountain-Pacific territory falls in third place, followed by Southern and Southwestern territories. In number of dwelling units, Western Trunk Line territory ranks second followed by Southern, Mountain-Pacific and Southwestern territories in the order named.

Automobile Secondary Metal Reserves

Large tonnages of the four principal nonferrous metals—copper, lead, zinc, and aluminum—enter annually into the manufacture of automobiles as well as millions of tons of iron and steel.

In the five-year period 1935-1939 the average volume of consumption of each of these metals and the average quantity and proportion of this total consumption used by the automobile industry was as follows:

Annual Average of 1935-1939[1]

Metal	Total United States consumption (Tons)	Consumption in automobile industry (Tons)	Percent of total consumption
Iron and steel	[2]33,676,717	[3]5,967,112	17.7
Copper	716,400	116,140	16.2
Aluminum	163,100	20,560	12.6
Lead	614,290	210,200	34.2
Zinc	539,800	67,560	12.5

[1] Automobile Facts and Figures, 1936-1940.

[2] Hot rolled iron and steel produced, in net tons (Annual statistical report of the American Iron and Steel Institute for 1939, p. 23).

[3] Steel and malleable iron only in 1937. Steel, malleable and gray iron other years.

[fol. 5560] Automobile metal, however, partakes of the nature of a more or less permanent revolving inventory. As already pointed out, this is particularly true of lead since the average life of a battery is much less than the average life of an automobile and most of the lead consumed by the automobile industry is in the form of battery plate. Although the total metal in automobiles is large, the comparatively short life of motor vehicles results in a high rate of scrappage. This means that there is comparatively little long-term accumulation of secondary reserves and that automobile metal represents at best the equivalent of only a few years consumption by that industry. These statements are subject to the qualification that the total metal in use is perhaps slowly increasing with the increased number of automobiles in use. Despite the decline in motor vehicle registrations in the early stages of the depression from 1931 to 1933, registrations in 1939 were more than 4 million cars above those of 1929, or roughly one-sixth greater.[1]

For estimating the quantities of automobile secondary metal reserves by freight rate territories the motor vehicle registration figures would appear to be fairly satisfactory. Table 13, therefore, shows the distribution of these registration figures for the five freight rate territories according to the two groupings A and B referred to above.

These registration figures indicate that nearly 50 percent of the secondary metal reserves in automobiles are in Official territory. Western Trunk Line is second followed closely by the Mountain-Pacific division. Southern territory is fourth and Southwestern last.

Secondary Reserves in Electrical and Other Machinery

Table 6 above indicated that on the basis of the five-year period 1934-1938 about twenty-three percent of the total copper was being used in electrical manufactures such as

---

[1] Automobile Facts and Figures, 1940, p. 11. This possible increase in metal is, of course, subject to qualification for any decreased weights which may have occurred.

[fol. 5562] generators, motors, electric locomotives, switchboards, light bulbs, etc. It is not clear whether copper in buildings includes the copper in switchboards. If included, it may probably be assumed that the building indicators in the table above would give a rough approximation of the probable location of the reserves of secondary metal in this use.

For the rate territory distribution of secondary reserves of copper the capacity of prime movers in 1938 has been taken as an index of the location of this metal and these figures are given in Table 14.

As all electric motors are dependent upon current, it is probably not unfair to assume that distribution of secondary reserves of copper in motors would correspond roughly with the distribution of copper in generators. Also, electric switchboard copper would presumably be located roughly according to the distribution of prime movers. If, therefore, prime mover capacity be accepted as a reasonably good indicator of the location of secondary reserves of copper used in electrical manufacturing, Official territory would account for close to 57 percent of the total. On this basis Mountain-Pacific is a poor second with about 15 percent and Southern territory slightly leads Western Trunk Line.

Large quantities of iron and steel, aluminum, and copper are also used in machinery and miscellaneous equipment other than electrical. Machinery took about 15 percent of the aluminum, based on the average for the six years 1933-1938, and copper used in "castings, n.e.s.", for bearings, bushings, lubricators, valves, and fittings utilized 5.60 percent of the copper in the 1934-1938 period. No figures of the iron and steel tonnage going into machinery, either electrical or otherwise, are available. The total is unquestionably large, however. Distribution of the secondary reserves of these metals in machinery and equipment other than electrical by rate territories would presumably follow the corresponding distributions of manufacturing establishments and manufacturing wage earners shown in Table 11 above.

[fol. 5564] *Secondary Metal Reserves in Wire and Cable*

According to the foregoing tables, electric conduction absorbed about 10 percent of the aluminum from 1933 to 1938 and electric light and power lines took about the same percentage of the copper in the five-year period 1934-1938. Figures permitting the breakdown of secondary reserves of copper and aluminum in use in these forms are not readily available. While it is possible that there are sources through which estimates of this distribution could be procured, it was not felt that their importance was sufficient to justify the probable amount of time and expense involved.

It is possible that the distribution of electric conduction copper and aluminum may perhaps follow roughly the prime mover distribution but the vast development of rural electrification in the last few years as well as the increase in long distance transmission renders any such possibility a somewhat dubious one.

Although telephone wire accounts for only about 4 percent of the consumption of copper, there are just under 90 million miles of telephone cable and aerial wire in use, largely of copper and nearly 2.5 million miles of telegraph wire. Table 15 shows the distribution of the telephone wire mileage in cable, and in total by freight rate territories compiled from state figures furnished by the Federal Communications Commission in September 1940. Similar figures for the distribution of telegraph wire are not available but the distribution is no doubt somewhat similar to that of the telephone wire. Assuming that this is a reasonably accurate index, therefore, a little less than two-thirds of the secondary reserves of copper are located in Official territory. The Mountain-Pacific section is second with around 11 or 12 percent. Western Trunk Line is third and Southern and Southwestern fourth or fifth depending on the grouping considered most valid.

During the five-year period, 1934-1938, lead cable covering consumed approximately 10 percent of the total lead. In 1935 Ingalls "supposed" that if a national inventory of lead in use were possible, the largest quantity would be

[fol. 5566] found in cables.[1] Table 15 above indicates that a slightly higher proportion of telephone wire in cables than of all telephone wire is located in Official territory though still only about two-thirds of the total. The distribution of the secondary lead reserves in this cable in the other territories is, of course, the same as the distribution of copper reserves in telephone cable.

Secondary Reserves of Iron and Steel in Railways

The railways have always been a large source of iron and steel scrap. The figures of miles of road (Table 16) indicate that between 28 and 30 percent of the to[illegible]at the end of 1938 was located in Official territory. Large quantities of iron and steel are also in use in locomotives and in railway cars, particularly of the steel and steel underframe varieties. For these no satisfactory figures by freight rate territories are available. However, some idea of the situation in the matter of the ferrous metal reserves in this equipment may be gained from the Class I railway statistics of equipment for the Eastern, Southern, and Western Districts, the last named including practically all of the three freight territories lying west of the Mississippi River.

In the Commission's figures the Pocahontas region is included with the Southern District although most of this region lies in Official rate territory. For this reason cars and locomotives of the railroads assigned by the Commission to the three districts are shown in Table 17 on the basis, first, of the Commission's figures for these three districts, and then upon the basis of deducting the figures of the Pocahontas region from the Southern District and adding them to the Eastern District.

The lines assigned to the Eastern District, excluding Pocahontas, reported around 42 percent of the steam locomotives, nearly 45 percent of the freight-train cars and

3/ Ibid., Table 28, p. S-24. Pocahontas Region figures from I.C.C. work sheets.

4/ Pocahontas Region included in Southern District.

5/ Includes 10 idler, 2 incline tow, 13 poling, and 7 trainmen's office cars.

6/ Includes 1 caboose-baggage and 59 drover cars.

7/ Pocahontas Region included in Eastern District.

[fol. 5569] over 52 percent of the passenger-train cars. The Western District accounts for nearly 40 and about 35.4 and 33.5 percent of these totals, respectively, the Southern District showing less than 20 percent in any of the three classes of equipment. Regrouping the district figures to include the Pocahontas region in the Eastern District increases the proportion of steam locomotives and freight-train cars attributable to that region by several points percent and the proportion of passenger-train cars about 2 points percent.

In terms of steel or steel underframe cars, which presumably contain appreciably higher quantities of metal, the Eastern District shows roughly about two points per cent higher proportions of both passenger- and freight-train cars than in the totals of all cars of these classes.

Location of Secondary Reserves of Metal as Indicated by Rail Movements of Scrap

Beginning with 1940 the Interstate Commerce Commission began the collection of commodity statistics by states of origin and termination. Iron and steel scrap was one of the classes of these commodities and at this writing figures for the first quarter of the year in question are available. Distribution of these figures by originating territory shown in Table 18 would indicate that in excess of 70 per cent of the iron and steel scrap originates in Official territory. With an exception for Western Trunk Line territory in Grouping B, the originations of other territories are all less than 10 per cent of the total. Official territory is also the only one showing a large surplus of terminations over originations, most of which surplus is apparently obtained from Western Trunk Line territory. The showing of this table is substantially confirmed by the scrap originations of the Eastern District for recent years shown in Table 19. Owing to possibly large movements by truck, however, the proportion of total scrap originations may vary substantially from those shown for rail carriers alone.

In the Rate Structure Investigation, I. C. C. Docket 17000, Part 12, a number of exhibits were

[fol. 5572] introduced on the nonferrous metals showing the originations of different kinds of scrap. These exhibits are fragmentary at best but as they appear to be all that is available, they are presented for whatever value they may have in throwing light upon the secondary reserves of nonferrous metals. Three exhibits show movements of scrap for April and October 1928 on a destination basis, as reported, respectively, by Western Trunk Line, Southwestern, and Transcontinental carriers (Tables 20, 21, and 22). Two show the territorial originations of scrap received at New England and two at Trunk Line points. Two other exhibits show originations of scrap metals moving from various producing points to consuming points in Illinois Freight Association and Central Freight Association territories, respectively, for the same months (Tables 24 and 25). These data would tend to confirm the showing of preceding tables as to the location of the secondary reserves of iron and steel and the nonferrous metals.

CHAPTER III

Rate Territory Distribution of Energy Resources

Relative Significance of Energy Resources

The term "energy resources" as ordinarily used, refers to a replenishable source of energy, waterpower, and the minerals from which energy is usually derived, coal, petroleum, and natural gas, or presumably nonreplenishable sources. Before attempting to show the distribution of these sources of energy between the different freight rate territories, it may be well to gain some perspective of the relative importance of these resources. The declining production of coal during the last two or three decades and the enormous increases in petroleum production, as well as our much publicized public water power projects such as the Tennessee Valley, Boulder Dam, and Grand Coulee, have led in some instances to somewhat erroneous impressions as to the relative significance and importance of these energy resources for the economy as a whole.

Coal

The decline in the coal industry in recent years has been due in part to the extensive substitution of other forms of energy generation for coal, but also to the amazing strides that have been made in increasing the efficiency of coal utilization. Coal has been losing ground relatively since the early part of this century, though the actual quantities mined continued to increase until 1918.[1] At the peak of consumption which occurred in that year coal supplied 82 per cent of the total energy derived from minerals and water power. By 1929 the proportion was down to 63 per cent, and by 1937, to 54 per cent.[2] Since 1923 the industry has been in a state of almost continuous depression. Despite this fact, coal remains the principal energy foundation stone of our industrial civilization, petroleum, natural gas, [fol. 5583] and water power following in the order named.[1]

---

[1] National Resources Committee, Energy Resources Committee, "Energy Resources and National Policy," January 1939, p. 9.

[2] Ibid., p. 44.

[1] Ibid., p. 30.

In 1937 the Bureau of Mines placed the supply of energy derived from coal at 12,977 trillion b. t. u. (11,592 trillion b. t. u. from bituminous) as against 7,666 trillion from domestic petroleum and 2,526 trillion for natural gas, or a total of 10,357 trillion for the two latter.[2]

It is apparent, therefore, that in this fairly active industrial year energy derived from coal exceeded the combined total petroleum and natural gas by substantially 2,500 trillion units or more than 25 per cent of the total energy from the latter two sources. So far as reserves are concerned, coal represents practically 99 per cent of the total heat value of the nonreplenishable mineral sources of energy as is shown by Table 26.

Water Power versus Fuel Energies

Based on the 1913 equivalent of 4.02 pounds of coal per kilowatt-hour, the energy supplied by water power in 1937 would aggregate only 2,405 trillion b. t. u. or about 19 per cent of the quantity derived from coal. Based on the prevailing central station equivalent, however, the water power energy was equivalent to only 849 trillion b.t.u. in that year.[3] With water power at the prevailing central station equivalent of 1937, therefore, coal accounted for 53.66 per cent (bituminous, 47.93 per cent), oil and gas for 42.83 per cent, and water power for only 3.51 per cent of the total energy supply of 24,183 trillion b. t. u.[4]

---

[2] Table 7, Minerals Yearbook, 1938, p. 703.

[3] Minerals Yearbook, 1938, p. 703. Between 1899 and 1937 the decline in pounds of coal consumed per kilowatt-hour was from about 7.05 to 1.42 (see note 4 to Table 7).

[4] Ibid. Using water power at a constant fuel equivalent (4.02 pounds per kilowatt-hour), the percentages for coal would be 50.42 (45.04 for bituminous), for oil and gas, 40.24, and for water power, 9.34 of a total energy supply of 25,739 trillion b. t. u. in that year. Ibid., particularly note 3 in Table 7 ibid.

(Here follows 1 photolithograph, side folio 5584)

Table 26. Reserves of Mineral Fuels and Their Importance in Terms of Heat Values 1/

Fuel	Proven reserves	Estimated heat value	
		Trillions of b.t.u.	Percent of grand total
	Tons		
Anthracite	15,415,622,000	395,557	0.6
Bituminous coal	1,407,808,291,000	38,578,947	56.9
Subbituminous coal	818,083,894,000	15,543,594	22.9

1/ Energy Resources and National Policy, op. cit., Table 1, p. 54.

> [fol. 5585] " 'Based upon present practice in the installation of water wheels for the utilization of water power sites, it is estimated that water wheels having a capacity of about 80,000,000 horsepower would be required to utilize all of the water power in the United States.' This capacity would generate power equivalent to the combustion of 183,000,000 net tons of coal, if the capacity-use factor is taken at 48 percent (the average for a typical year) and the fuel consumption taken at 1.46 pounds per kilowatt hour (the average of central stations for 1935)." [1]

It was the opinion of a noted expert (Tryon) expressed in the Carter coal case that water power could never supply more than a minor fraction of the energy requirements of the country. Charles P. Steinmetz estimated that if every drop of water falling as rain in the United States could be transformed into power at the existing gradients, the quantity of energy would not equal that derived in good years from coal.[2] Calculations presented at the Third International Conference on Bituminous Coal indicated that the entire run-off of water, if put to work, would yield annually the energy equivalent to 437 million tons of coal.[3]

These estimates may be compared with the actual production of mineral fuel in the United States in 1929 which, including oil and gas, was equivalent to 920 million net tons of [fol. 5586] coal.[4] At the 1937 rate of utilization of capacity, the maximum output of potential water power would have been the equivalent of only 31 per cent of the coal tonnage used in that year.[1]

> "The replenishable sources of energy, falling water, wood, wind, work animals, and synthetic fuels from

> crops, do not have unlimited possibilities of expansion. Years of scientific investigation thus far have failed to discover means for giving these 'substitutes' for coal a major position in the market for energy. Their period of use, however, may be extended indefinitely. The possibility that any one of them will assume a major share of the burden carried by irreplaceable fuel seems remote, although, as a group, they may grow in importance as the cost of producing mineral fuels rises. * * * The safest assumption is that the most economical energy of the future will be derived from mineral deposits. Shorter life for oil and natural gas than for coal eventually will throw the main burden of the demand for mineral fuel on coal reserves."[2]

Still further estimates of the importance of water power were presented in the Energy Resources Report:

> "At the beginning of 1938, at all water-power plants having a capacity of 100 horsepower or more, there were installed water wheels aggregating 17,284,379 horsepower. The Geological Survey considered at the beginning of 1936 that around one-fifth of our feasible potential water power had been developed. The aggregate capacity of prime movers was estimated in [fol. 5587] 1935 at about 1.2 billions of horsepower. These data indicate that water wheels for all water-power sites might have an aggregate capacity about 7 per cent as great as the aggregate capacity of prime movers in 1935. Such percentage, although used at times, leads to an understatement of the importance of water power. * * *
>
> "The Bureau of Mines estimates that our total use of energy in 1937 was equivalent to 24,183 trillion B.t.u.; water power, included in terms of prevailing use of fuels in generating power at central electric stations, is estimated to have supplied 849 trillion, or 3.51 per cent of the total. In terms of the estimate of 1936 that water power was approximately one-fifth developed, we might conclude that water power used

---

[2] Ibid. Qualifications of this statement so far as it refers to oil and gas are noted subsequently in connection with the discussion of the oil and gas reserves.

> at about the same efficiency as that of 1937 would in total produce annual energy equivalent to nearly 18 per cent of the total energy used in 1937, which probably was greater than that of previous years except 1926 and 1929.
>
> "Production of electricity by hydroelectric generators in electric utility plants in 1937 amounted to 43.7 billion kilowatt-hours. Production of energy from water wheels outside the utility industry is not reported, but it is estimated as equivalent to 4.9 billion kilowatt-hours. The total energy output of water wheels, therefore, is estimated to have been equivalent to 48.6 billion kilowatt-hours. The Federal Power Commission estimates feasible undeveloped power great enough to produce somewhat over 273 billion kilowatt-hours a year. Presumably, existing water-power plants did not produce power as fully as their development and the available flow would permit. Therefore, the estimated total feasible energy output from water would exceed 322 billion. The estimated energy output of existing water-power plants was 48.6 billion, [fol. 5588] or 15.1 per cent of 322 billion. Thus, water-power plants, estimated to have produced 3.51 per cent of the total energy produced, are estimated to have produced something less than 15.1 per cent of the feasible total output from water power. From these items follows the estimate that total feasible output from water power would at least exceed 23.3 per cent of the total energy produced in the form of fuels and water power in this country in 1937."[1]

However, estimates of potential energy derivable from water power, like estimates of reserves of coal and petroleum, are subject to considerable qualification and correction. In the case of water power, the estimates are seriously affected by the great variation in stream flow and the extent to which such flow can be regulated and the efficiency of hydroelectric units in recovering the energy in falling water. Other variations will also be found, depending upon the basis of calculation which is used in estimating the total energy. It must be recognized, therefore, that estimates of feasible water power can be considered only as "useful approximations" while estimates of energy output from fuels and the fuel equivalents of water power must be taken as merely "the best comprehensive working approximation" so that an "exact evaluation of the importance of water power is impossible." The final conclusion in the Energy Resources Report, however, is that "it looks as if feasible annual output from water power might be considered equal to more than one-fifth, possibly equal to one-fourth, of our largest past annual output of energy."

---

[1] Energy Resources and National Policy, op. cit., pp. 239-240.

As these comparisons are between a theoretical maximum for water power and past performance for other energies, it is apparent that this way of stating the proposition tends somewhat to overrate the significance of water power.[2] If, as we hope, our standard of living continues [fol. 5589] to increase and if population increases for some time to come even at a decreasing rate it seems apparent that the significance of *feasible water power* as a source of energy will be of declining importance in the energy total and *actual water power energy* quite likely even more so.[1] In its Summary of Conclusions the Energy Resources Committee wrote, "All our water power, including both that already developed and that feasible of development, could produce energy annually equivalent to only about one-fourth of the energy contained in all mineral fuels consumed in the country in 1937 for all purposes. Thus it can be seen that water power can suply only a fraction of our energy requirements. The mineral fuels must bear the main burden."[2]

---

[2] The report under discussion recognizes this fact. "If our use of energy continues to expand greatly, water power, being limited, could supply only an eventually declining portion of the energy." Ibid., p. 240.

[1] Looking far ahead, the report continues, "the expectation that our population might become stationary, or actually decline, within a few decades, suggests that water power might come to hold its own or even to attain increased relative significance." Ibid., p. 240. However, it is scarcely necessary to point out that if this is so, it would hardly be at a level as high as suggested.

[2] Ibid., p. 32.

Reserves of Fuel Energy

For the nonreplenishable energy resources, coal, oil, and gas, estimates of the total reserves have frequently been made and the data are in such form that approximate geographical distributions of these reserves can be made by freight rate territories. In the case of the replenishable energy resource represented by power derived from falling water, there is, of course, no reserve in the same sense as in the case of the energy mineral resources. However, to date only a small proportion of the total available water power is actually being utilized for the production of energy. In a sense, therefore, this unused water power may be regarded as a huge reserve of potential energy as yet untapped. In this section estimates of reserves in the fore- [fol. 5590] going senses are presented as totals and distributed among the five freight rate territories.

Coal Reserves

In 1928 the United States Geological Survey estimated the total original tonnage of all coal at 3,214,898,600,000 net tons of 2,000 pounds, the total depletion (production and waste), at 25,517,232,000 tons, leaving the estimated reserves at the end of that year at 3,189,381,268,000 net tons.[1] By the end of 1934 it was estimated that a total of 3,182,000,000,000 net tons was still left underground.[2]

First made in 1912 and subsequently revised in some points, the estimates of original reserves were chiefly the work of Marius Campbell, among the most distinguished of American geologists. "* * * they incorporate the results of a lifetime of observation and field study of American coals. The estimates may be accepted as the best that could possibly be made from the data available at the time of compilation."[3] There are some indications, however, that these figures were too high,[4] and between 1912 and [fol. 5591] 1928 Campbell was led to reduce his earlier estimates by 291 billion tons. Also the great bulk of the reserves are composed of low grade bituminous, sub-bituminous, and lignite coals, the heating value of which is substantially below the grade of the average coal produced today in the United States. In terms of heat equivalents equal to those of the average grade of coal now mined, Rice, Fieldner and Tryon estimates that the reserves would have to be reduced by 25 per cent.[1]

[2] Rice, Fieldner, and Tryon, Conservation of Coal Resources, Third World Power Conference, Vol. 6, p. 673.

[3] Ibid.

Although there has been only a relatively slight reduction to date in the quantity of the original reserves of coal, a geographical distribution of the tonnages by freight rate territories has been made for both the estimated original and present reserves. Table 27 shows the distribution of the Campbell estimates of original reserves and Table 28 the reserves as of January 1, 1937, as brought down to date in the report of the National Resources Committee on Energy Resources and National Policy.[2]

Because of the location of the fields, all of the Virginia reserves have been included in Southern territory although much of the area of that state lies in Official territory. Michigan reserves are apparently entirely in the southern peninsula and hence are included in Official territory. Colorado reserves are apparently located in both Western Trunk Line and Mountain-Pacific territories. As nearly as can be judged from the map of the coal fields by the U. S. Geological Survey (See Map 2) the bulk of the Colorado coal is in the Mountain-Pacific territory and the total production of that state, therefore, has been included in the Mountain-Pacific area. If the actual reserves lying in each freight rate territory could be readily separated, there would, of course, be a much more even distribution of the total reserves between the two territories. However, much of this Colorado coal lying along the boundary of these two freight rate territories is bituminous of doubtful value and the balance is commercial sub-bituminous.

---

[4] Due to the unavailability from a practical standpoint of much of the nominal tons below ground, losses from mining, and later and more accurate data, these estimates are too high. On the last point Pennsylvania State geological survey estimated the original reserves of that state at a little over 68 billion metric tons against nearly 102 billion in the original Campbell estimates. (Ibid., p. 673.) On mine losses Rice, Fieldner and Tryon estimate that 35 per cent is the average and that 15 per cent is unavoidable. (Ibid., p. 674. See also slightly different estimates of Rice and Paul in the United States Coal Commission report in 1923 cited in Energy Resources and National Policy, 1939, op. cit., p. 286).

1/ Compiled from Energy Resources and National Policy, Report of the Energy Resources Committee to the National Resources Committee, pp. 283-5. Figures brought down to date by T. A. Hendricks.

[fol. 5595] The foregoing text tables show very clearly the heavy preponderance of the total reserves of bituminous and semibituminous coal in Official territory, this area possessing between 40 and 45 percent of the total for the United States or approximately as much as the Southern and Mountain-Pacific freight rate territories combined. Also Official territory possesses a practical monopoly of the anthracite reserves. Moreover, a glance at the accompanying map indicates that most of the Official territory bituminous area contains coal of commercial value whereas much of the bituminous area of the Mountain-Pacific division contains coal of doubtful commercial value. Practically all of the Southern bituminous area and most of that of Western Trunk Line territory, however, is of present commercial value.

As shown by Table 28 the present reserves of sub-bituminous and lignite are in excess of 1,700 billion tons as compared with a total of slightly over 1,400 billion for bituminous. The former reserves are highly concentrated in Mountain-Pacific and Western Trunk Lines territories. In terms of total tonnage of all coals, therefore, the Mountain-Pacific territory accounts for nearly one-half (47.09 per cent) of the country's present reserves and Western Trunk Line for nearly one-quarter (23.36 per cent) leaving Official territory with less than 20 per cent of the total and Southern territory with less than 8 per cent (Table 29). However, it is necessary to remember that the lower rank coals possess a lower heating value per pound than those of higher rank. As Map 2 indicates and as the Federal Power Commission points out,

> "In a very general way, these coals become poorer as one travels from east toward the west. In the area east of the Mississippi River, and particularly in the Appalachian field, the greatest production and the best quality of coals are found. It is in this area, also, that coal finds its greatest use as a power-producing agent."[1]

[fol. 5596] A ton of bituminous coal has more than twice the heating value of a ton of lignite, and bituminous (including semi- and sub-bituminous) and anthracite combined possess between them about four-fifths of the heating value of all coals.[1] Table 29, therefore, distributes the reserves of different types of coals by freight rate territories in terms of bituminous coal equivalents. Table 29 brings together for the five freight rate territories the total tonnages of all coals from Table 28 and the total tonnages of all coals in terms of bituminous heat equivalents. The effect of this conversion is to increase markedly the importance of Official and Southern territory at the expense of the Mountain-Pacific and especially Western Trunk Line territory, giving Official one-quarter of the total reserves in terms of bituminous coal equivalent and the Southern nearly 10 per cent. The enormous reserves of subbituminous and lignite in the Moutain-Pacific division, however, leave that territory in a dominant position with nearly 45 per cent of the reserves in terms of bituminous equivalents.

---

1/ From Energy Resources and National Policy, Report of the Energy Resources Committee, 1939, pp. 283-5. Original tonnage estimates are those of M. R. Campbell: Coal Resources of the United States, U. S. Geological Survey, 1928. The production and amounts lost in mining and marketing were brought down to date as of Jan. 1, 1937, in the Energy Resources report.

2/ Recompiled from Table 2, p. 58, of Energy Resources and National Policy, op. cit. Conversion ratio used in the National Resources table, 13,700 b.t.u. for bituminous, 12,700 for anthracite, 9,500 for sub-bituminous, and 6,700 for lignite. Ibid., p. 59.

Most of the earlier estimates apparently included unproved reserves in unknown fields as well as proved re- [fol. 5598] serves. The former could not obviously be estimated with any substantial degree of accuracy. In the case of proved reserves, however, the quantity could be approximated with much greater exactitude based upon past production of depleted fields.[1] The first estimate of proved reserves was made by a joint committee of the American Association of Petroleum Geologists and the Geological Survey in the year 1921.[2] From this date to the middle of 1939 there have appeared a total of some 36 estimates of proved reserves or an average of about two estimates per annum. From the first figures of 5 billion barrels, published in 1922, and which included both proved and unproved reserves, the estimates have gradually risen to nearly 3½ times that figure in 1939.[3]

In considering the estimates of the petroleum reserves of the country, however, and more particularly as distributed among the different freight rate territories, it is necessary to recognize fully the somewhat speculative character[4] of

---

[1] Energy Resources and National Policy, op. cit., p. 289.

[2] The Oil Supply of the United States, bul. of the American Association of Petroleum Geologists, 1922, Vol. VI, No. 1, pp. 42-46.

[3] Seven estimates were published in the first four months of 1939. The lowest was about 14 billion barrels and the highest 17,751,000,000 barrels. Outstanding Features of Oil-Field Development and Petroleum Geology in the United States, 1934-1938, by the Geological Survey, Petroleum Investigation, Hearing before a Subcommittee of the Committee on Interstate and Foreign Commerce, 76th Congress, on H. Res. 290 and H. R. 7372, pp. 102-103.

[4] "In 1860, one year after the Drake well was brought in at a 69-foot level, an oil shortage was predicted as the prevailing rate of oil consumption would exhaust the supply in a few years. This prediction has been reiterated at about five-year intervals ever since. In 1860 the U. S. A. crude oil production was 500,000 barrels and 1,250,000,000 barrels in 1939. * * * During last year alone, approximately 2,000,000,000 barrels of crude were added to our oil reserves above that actually used. Through the years crude oil reserves have been increasing by finding new oil fields, by

[fol. 5599] these reserves as well as the effect of this fact on the reserve estimates of particular areas.

Many of the more recent estimates have been made by states and the elements of speculation involved may naturally affect the state and the freight rate territory totals more significantly than the totals for the country where overestimates in one state or territory may be more or less counterbalanced by underestimates in another. The Report of the Resources Committee on Energy Resources and National Policy contains a comparison in total and by states of three 1938 estimates of petroleum reserves made, respectively, by the American Petroleum Institute, the Oil and Gas Journal, and Alex W. McCoy. The highest of these three, 15,506 million barrels, is only a trifle more than 20 percent above the minimum of 12,909 million. Of the 18 states for which figures are given, however, the highest estimate exceeded the lowest by more than 40 percent in all but one-third of them, and in five of these 18 states the maximum of the three estimates exceeded the minimum by more than 100 percent.[1] By rate territories the variation in the 1938 estimates is, as would be expected, considerably greater in some cases than for the country as a whole though very much lower in all cases than the higher ranges of variation appearing in the state figures cited above.

Table 30 presents estimates of petroleum reserves for selected years as compiled by freight rate territories from

---

deeper drilling in old fields, and by hydrochloric acid treatment, called acidizing, of old and new oil sands." Gustav Egloff, Progress in Petroleum, address at the 18th Annual Meeting of the American Institute of Chemists in Acceptance of the Medal Award in 1940.

8/ Does not include 1,500,000 bbls. for which the states of origin are not specified.

[fol. 5601] the state figures reported in various sources. Outside the Southwestern and the Mountain-Pacific divisions the reserves are relatively insignificant.

The Southwestern freight rate territory with approximately 68 per cent of the total according to the 1939 preliminary estimate, is, of course, outstanding in its possession of proven petroleum reserves and this territory together with the Mountain-Pacific division had 92.9 per cent of the total reserves in 1939. Although the reserves of the Official freight rate territory are relatively insignificant in comparison with those of either the Mountain-Pacific or the Southwestern areas, they are many times those of Southern territory and less than 0.1 per cent below those of the Western Trunk Line area.

Examination of the map of reserves (Map B) prepared by the U. S. Geological Survey and taken from the report on Energy Resources and National Policy[1] sheds some further light on the question of reserves of the different rate territories in terms of possible future potentialities. A considerable portion of the areas lying within Official territory (most of the States of Illinois, Indiana and Ohio and parts of Pennsylvania and West Virginia) are classed by the Geological Survey as "possible" productive territory, i.e., areas in small parts of which commercial quantities of oil may be found in the future. The same is true of a large portion of the states in Southern territory, all of Mississippi and Florida and nearly all of Kentucky and parts of Tennessee and Alabama. Western Trunk Line territory includes also a narrow "possible" strip in western North Dakota widening southward through South Dakota and Nebraska and including all the State of Kansas. This belt of "possible" productive territory extends westward into the Mountain-Pacific territory, including most of Montana, Wyoming, Colorado and a sizeable part of Utah. Almost all of the Southwestern territory is considered as "possibly" productive on a commercial basis. The balance of the United States is unfavorable for oil production except for a narow strip along the Pacific coast,

[fol. 5603] the bulk of which is classified as possible for production. The largest single area classified as impossible runs south from Virginia through the Carolinas and Georgia into Alabama.

None of the foregoing calculations of Petroleum Reserves include any allowances for oil production from oil shales or from coal. Many years ago it was estimated that the total recoverable oil from the oil shales of the United States was 92,144,985,000 barrels or ten times the amount of well oil produced in the United States up to the close of 1924. More than 75 billion barrels of this total was estimated to be in the Mountain-Pacific territory. Not quite 7 billion of the remainder was located in Official territory and not quite 10 billion in Southern territory.[1]

The distribution of the coal reserves of the United States by freight rate territories has been presented in the preceding discussion. This coal will yield an oil somewhat similar to petroleum which assures an adequate reserve for centuries to come, assuming, of course, that price and demand would justify extraction. For bituminous, sub- and semi-bituminous the total has been estimated at 525 billion barrels of heavy liquid fuel or 92 billion barrels of motor fuel. The lignite deposits are estimated to yield in addition 70 billion barrels of liquid fuel or 12 billion barrels of motor fuel.[2] No distribution of these figures by freight rate territories has been undertaken for either the oil shales or for coal on account of the remoteness of the probable utilization of these resources for petroleum production.

Natural Gas Reserves

One-half, roughly, of the gas reserves of the United States show practically the same geographical distribution as the oil reserves. This is because approximately one-half [fol. 5604] of the natural gas is produced with oil, the gas being the source of energy which brings the oil to the surface. For a considerable period of years now, 1,500 to 2,000 cubic feet of natural gas per barrel of oil has been marketed and the tendency is that this ratio will increase in the future. As the known oil reserves are of the order of 15 billion barrels, we are thus presumably assured of a minimum reserve of between 22.5 and 30 trillion cubic feet of natural gas.

---

[1] Dean E. Winchester, The Oil Possibilities of the Oil Shales of the United States, Appendix 1, Report II of the Federal Oil Conservation Board to the President, 1928, pp. 13-14.

[2] Bureau of Mines, Appendix III, ibid., p. 21.

But gas is also found in many areas which do not produce oil and larger volumes of gas are also being found with oil discovered and produced from progressively greater depths. As in the case of oil, several estimates of the natural gas reserves have been made and these estimates, like those of oil reserves, have been gradually increasing in size. In 1930 Huntley and Mason estimated the gas reserves produced with oil east of the Rockies to be 49.5 trillion cubic feet as a minimum. Although they did not estimate the Pacific Coast reserves, they suggested that the minimum oil reserves for that area would be of the order of 8 billion barrels. Assuming 1,500 cubic fet of gas produced per barrel of oil, their oil estimate would add a total of 12 trillion cubic feet to their figures for reserves west of the Rockies, thus raising the total to above 60 trillion cubic feet. But H. O. Castor, president of the American Gas Association, and V. R. Garfias in 1931 and 1934, respectively, placed the proved reserves much below this figure estimating only 30 trillion and 40 trillion cubic feet, respectively. In 1935, H. A. Ley estimated future recoverable gas from commercially proved and important areas as not less than 75 trillion cubic feet, although pointing out that most of this reserve has been discovered and proved in connection with the search for oil and that some part of it would be wasted in the production of oil. In the same year R. E. Davis in a paper before the American Gas Association estimated the known natural gas reserves at 62 trillion cubic feet. Hoots and Herold took exception to the Davis estimates, especially with regard to the California reserves which they placed at 34 trillion cubic feet as against the Davis figure of 5.9 trillion. If their figures be substituted in the Davis estimate, the total of the reserves would exceed 90 trillion cubic feet. Richards, after setting out the foregoing estimates in the [fol. 5605] Energy Resources report, concludes:

"The discovery of important gas reservoirs since the date of the above estimates, notably by deeper drilling in California, the Rocky Mountain area, and in the North Central States, warrants the opinion that the known natural-gas reserves of the nation are at least of the order of a hundred trillion cubic feet, or in excess of 30 years' supply in terms of the present high rate of utilization."[1]

At the request of a representative of the Commission, Dr. Richards has kindly furnished his approximate distribution of these natural gas reserves by freight rate territories as follows:

Freight rate territory	Trillion cu. ft.
Official	6
Southern	3
Western Trunk Line	11
Southwestern	41
Mountain-Pacific	39
Total	100

Total Energy of Mineral Fuel Resources

Table 30A compiled from the data in Tables 29 and 30 and the estimates of natural gas reserves by Dr. Ralph Richards of the Bureau of Mines in the preceding subsection shows the distribution of the mineral fuel energies in terms of heat units. Because of the enormous significance of coal in the total reserves of mineral fuel energies, the showing of this table differs but little from that for all coals in terms of bituminous shown in Table 29. In both cases the Mountain-Pacific territory leads with over 44 percent

Southwestern	1,978,046	62,825	44,075	2,084,946	3.2
Mountain-Pacific .	28,451,354	25,351	41,925	28,518,630	44.3
United States	64,159,781	95,136	107,500	64,362,417	100.0

1/ From Tables 29 and 30 and page 125. Conversion ratios used are those shown in Minerals Yearbook for 1938, p. 703, as follows: bituminous coal, 13,100 b.t.u. per pound; petroleum, 6,000,000 b.t.u. per bbl.; natural gas, 1,075 b.t.u. per cu. ft.

2/ Excluding oil from oil shales.

[fol. 5607] of the total, followed by Official territory with over 25 percent. Also in both tables Western Trunk Line, Southern, and Southwestern show over 17, 9, and 3 percent, respectively, of the total for the United States.

Water Power Resources

In 1937 the total capacity of installed water wheels in plants having 100 horsepower or more in the United States was estimated by the U. S. Geological Survey at 17,120,000 horsepower. In the same year the production of electric energy in the United States was slightly in excess of 121 billion kilowatt-hours, of which nearly 44 billion or a little over 36 percent was produced by hydroelectric and the balance by plants utilizing fuel energy. As against the figure of 17,120,000 horsepower capacity of installed water wheels, however, the potential water power of the United States was estimated at a total of 42,753,000 horsepower available 90 percent of the time and 57,184,000 horsepower available 50 percent of the time. Potential water power, as measured by horsepower available 90 percent of the time, therefore, was equivalent to roughly 2½ times the actually installed horsepower capacity and when measured by horsepower available 50 percent of the time, was equivalent to nearly 3.4 times the total installed horsepower capacity.

In Tables 31 and 32 these figures have been distributed by freight rate territories, the differences in the tables and totals for the same territories representing differences in the groupings of the states used in the composition of the rate territory figures.

In both groupings Mountain-Pacific and Official rate territories are outstanding in the production of hydroelectric energy and also in the horse-power of installed water wheels. Together they account for over 70 percent of the hydroelectric energy and around two-thirds of the capacity of installed water wheels regardless of which grouping is considered. In 1937 hydroelectric energy produced in Mountain-Pacific territory exceeded Official territory by several points percent but in capacity of installed water

5/ Including Virginia and Louisiana.

6/ Including Wisconsin and Colorado and excluding Michigan. The upper peninsula of Michigan, which belongs in Western Trunk Line territory, is relatively unimportant compared with the state as a whole.

7/ Excluding Louisiana.

8/ Excluding Colorado.

[fol. 5610] wheels neither territory showed a significant lead over the other, Official territory leading slightly in the A grouping and Mountain-Pacific in the B. In very rough terms, therefore, each of these two rate territories showed about as much installed capacity and generated about as much hydroelectric power as all of the remaining thre freight rate territories combined. The Southern rate territory is a rather poor third in hydroelectric production but makes a somewhat better showing in the capacity of installed water wheels as compared with either Mountain-Pacific or the Official rate areas.

As already pointed out, reserves in the sense of irreplaceable mineral resources cannot be said to exist in the case of a replenishable natural resource, such as water power. In so far, however, as such replenishable resources have not been fully developed or utilized, they may be said to constitute a reserve of natural resources in the sense that until fully utilized the quantity of replenishable energy may be steadily expanded.

From the standpoint of water power reserves, therefore, or perhaps more accurately potential water power energy, a freight rate territorial distribution tells a somewhat different story than does the capacity of installed water wheels or the production of hydroelectric energy. One of such distribution of estimated potential energy is shown in the first two columns of the two preceding tables. Whether water power available 90 percent of the time or available 50 percent of the time is used, the Mountain-Pacific division accounts for close to two-thirds of the total. Official territory, however, has between 16 and 19 percent of the total as against between 10 and 12 percent for Southern territory. Neither Western Trunk Line nor Southwestern territory is of significant importance as a source of potential energy although the former area is much better off in this respect than is the latter.

According to the Federal Power Commission, the total feasible addition to the annual output of energy in terms of kilowatt-hours was 273,377 millions as compared with 48,580 million estimated as the actual annual output of water power plants at the end of 1937. The total of the two [fol. 5611] would be 321,957 millions of kilowatt-hours according to the Energy Resources report. In other words, about 15 percent of the estimated feasible annual output was in use at the end of the year 1937.

Tables 33 and 34 present the distribution of these estimates according to the same two groupings of freight rate territories as were shown in the preceding tables.

The resulting pictures merely emphasize the previous showing of the outstanding importance of the Mountain-Pacific area from the standpoint of potential energy production. With a 1937 estimated annual output only a little over one-third of the kilowatt-hours for the entire country, it accounts for nearly three-quarters of the estimated feasible additions and for in excess of two-thirds of the estimated feasible annual power output in terms of kilowatt-hours. In considering the significance of these figures it is necessary to recognize that their importance is affected by certain technological limitations on the transmission of power. Comparatively little water power is used directly at the power site. Technical limits of transmission while not well defined are sufficiently narrow to render much of the electric power generated in one freight rate territory unavailable to other freight rate areas[1] at least for the present. Utilization of the vast reserves of the Mountain-Pacific area, therefore, must presumably depend either on further developments in low cost transmission of electric power or further industrial development of the Mountain-Pacific freight rate territory.

---

[1] According to Dr. Karl T. Compton, speaking in 1937, about 250 miles from the generating station, and according to J. D. Ross, late administrator of Bonneville, speaking in 1938, about 300 miles for very large blocks of power. In Energy Resources and National Policy, op. cit., p. 245, from 5 Edison Electric Institute Bull., Vol. 5, No. 1 (Jan. 1937) and Scientific American, Dec. 1938, p. 305.

CHAPTER IV

Rate Territory Distribution of Agricultural Resources

Importance of Agricultural Resources

The significance of our agricultural resources lies not alone in the fact that agricultural products provide the foodstuffs for our huge population, but also in the fundamental importance of such products as a source of raw material for the manufacture of a great variety of commodities other than foodstuffs.

A good many years ago Malcolm Kier stated that "Farms furnish more than three-fourths of all materials upon which factories worked."[1] Although some attempts have been made to verify this figure, no confirmation of it has been found up to the date of this writing.[2]

In the early 1930's, however, the late Tracy E. Thompson, an industrial analyst of the Bureau of the Census, made a study of "Materials Used in Manufactures" based upon the census of manufactures of 1929. This study showed the estimated cost to manufacturers of the raw materials produced by each of five extractive industries. Of the total cost estimated at 12.676 billion dollars, including both domestic and foreign products, 8.451 billion was supplied by agriculture and animal husbandry, or 67.4 percent of the total. Excluding foreign raw materials, 6.763 billion out of a total of 10.472 billion was paid for the products of agriculture and animal husbandry or about 64.5 percent of the total. The cost of manufacturing raw materials derived from each of the five extractive industries as estimated in the Thompson study is shown in Table 35.

---

[1] Malcolm Kier, "Manufacturing," 1928, p. 3.

[2] Professor Kier was unable, upon inquiry, to furnish the source of his information other than that he was sure that he obtained the statement from the introduction to the Census of Agriculture "which census, 1930, 1920, 1910, I cannot recall because the notes for that book have been burned." Examination of the publications in question did not disclose any such figures nor has inquiry through various channels at the Department of Agriculture turned up any clues as to the source of such a figure.

[fol. 5616] "The highly industrialized character of Official classification territory has apparently tended to obscure the fact that it is at the same time an equally or more important agricultural area, depending on the criteria employed, than any of the other freight rate territories. For example, Table 36 shows that in 1939, the latest year for which the figures are available, the gross farm income of the United States aggregated 8.96 billion dollars, of which Official territory produced 2.76 billion, or approximately 31 per cent. Western Trunk Line territory was a close second in importance, accounting for 2.38 billion, or approximately 27 per cent of the total, and was followed by the Southern, Mountain-Pacific, and Southwestern rate areas in the order named. No one of these last three areas, however, produced as much as 17 per cent of the United States total in the year in question. As used in this table, gross income consists of the cash income from sales plus the value of home consumption after eleminating the value of crops fed to livestock. The figures do not include $807,065,000 of income representing government payments.[1]

Not only did Official classification territory lead in the proportion of gross farm income produced in the five rate territories, but it also led, though by a narrow margin, in the gross farm income from crops and from livestock and livestock products.

In crop income, however, the Southern rate territory was a close competitor of Official territory with only a little over 12 million less income, and in livestock and livestock products Official territory led the Western Trunk Line area by less than 52 million dollars. It is important, however, that Official territory's showing for total farm income is not due to excess weighting by either the crop or livestock figures but that the area actually led in both respects. Both Mountain-Pacific and Southwestern territories show a remarkably equal division of their agriculture between crops and livestock products. In contrast, both Western Trunk Line and Official territories show a little less than two-

1/ Preliminary.

2/ Data for states divided by freight rate territory boundaries were apportioned to territories on the basis of the total farm value of crops harvested in 1939 (see tables on acreage, production, and value of individual crops for 1939) after deducting principal feed crops (corn, oats, barley, rye, buckwheat, grain sorghums, hay, and sweet sorghums).

3/ Data for states divided by freight rate territory boundaries were apportioned to territories on the basis of the total farm value of livestock and livestock products produced in 1939 (see tables on production and value of individual livestock products), except that gross income from eggs and milk was used in the apportionment in place of farm value.

Source: U. S. D. A., B. A. E., "Gross Farm Income and Government Payments, 1936-1939," July 8, 1940 (mimeographed).

[fol. 5618] thirds and three-quarters, respectively, of their total gross income derived from livestock and livestock products. In Southern territory, however, this situation is reversed, over 61 per cent of Southern territory farm income coming from crops and a trifle over 38 per cent from livestock.

From the standpoint of total United States production, however, all three territories besides Official and Western Trunk Line are relatively low in proportion of gross income produced by livestock and livestock products. Each of the two latter territories accounts for a somewhat greater proportion of the United States total than all of the other three rate areas combined.

Agricultural Resources as Measured by Quality of Land

These differences in relationships between the freight rate territories are due in a considerable degree to differences in the physiographical conditions required for the production of crops and livestock and livestock products. These basic factors which thus delineate the agricultural resources of the United States, according to a leading authority on this matter are [1]: (1) Topography, lay of the land, and degree and direction of slope; (2) soils, which are influenced greatly in their development by climate and the natural vegetation; (3) temperature and precipitation, of which the duration of the frost-free season and seasonal distribution of precipitation are important.

These physical conditions are obviously of such a character that their conversion into measurable arithmetic or other terms is extremely difficult and necessarily the results of such conversion must be more or less of an approximation. However, one type of such conversion has been made under the direction of Dr. Curtis F. Marbut of the Bureau of Chemistry and Soils, United States Department of Agriculture, by grading all the land of the United States according [fol. 5619] ing to its productivity for crop production, the results of which were published by the National Resources

Board in 1934.[1] The method used attempts to take into consideration all the principal physiographical conditions influencing productivity such as soil type, topography, rainfall, and temperature. Using these factors, the entire land surface of the United States was classed into five grades of productivity.

> "Grade 1 may be briefly described as excellent land for the staple crops climatically adapted to the region in which its lies; grade 2 as good; grade 3 as fair; grade 4 as poor; and grade 5 as essentially incapable of tillage.
>
> * * * * * * *
>
> "Naturally poorly drained lands were graded according to their productivity under their present condition of drainage, whether they are articially drained or not. Irrigated lands were graded according to their original nonirrigated condition * * *"[2]

As published in the National Resources Board report the land area of each state was thus classified and these figures have been regrouped by freight rate areas in Table 37.

Western Trunk Line territory is outstanding in its possession of land of grades 1 and 2. Roughly two-thirds of all the land in the United States of grade 1 and nearly half

Graded according to ability to produce without irrigation, or without additional drainage.

The variation between Grouping A and Grouping B is due to a difference in the allocation of states divided by freight rate territory boundaries as follows:

State	Grouping A	Grouping B
Michigan	Official	Western Trunk Line
Wisconsin	Western Trunk Line	Western Trunk Line
Virginia	Official	Southern
Louisiana	Southwestern	Southern
Colorado	Mountain-Pacific	Western Trunk Line

For more exact statement, see text.

urce: National Resources Board, "A Report on National Planning ....," December 1, 1934, p. 127.

of all the land of grade 2 is in this area. Official territory, [fol. 5622] however, ranks second in both, though possessing an insignificant margin over Southwestern territory in this respect so far as grade 2 land is concerned. Together, Western Trunk Line and Official territory account for over 90 percent of the total grade 1 land in the United States and for just short of two-thirds of the total grade 2 land. No one of the other three territories possesses as much as 5 per cent of the grade 1 land. Official territory contains by far the smallest proportion of the total land area essentially incapable of tillage.

The proportion of the United States total of each grade of land which is included within the Western Trunk Line and Official territories declines consistently through all five grades as the quality of the land decreases. Exactly the reverse, however, is true of the Mountain-Pacific division and of the first four grades in Southern territory and the first three in Southwestern.

A comparison of territories on the basis of the proportion of their area in each grade of land further substantiates the leading positions of Western Trunk Line and Official territories. A higher porportion of the land in Western Trunk Line territory belongs in Grades 1 and 2 than in any other area, Official territory ranking second in both cases. About 40 per cent of the land area of the Western Trunk Line territory belongs in Grades 1 and 2 and nearly one-third of that in Official classification territory. The proportion of both grades combined is much lower in Southern, Southwestern, and Mountain-Pacific divisions. In the Mountain-Pacific area there are less than 500,000 acres of Grade 1 land out of around 700 million total acres. Less than 3 percent and only a little more than 1 percent of the total Grade 1 land are found in Southwestern and Southern territories, respectively. Southwestern territory, however, has a proportion of Grade 2 land not greatly below the proportion of Official classification territory, but Southern territory shows less than 10 percent of its total land in this classification and less than ½ of 1 percent of the Mountain-Pacific division is found in Grade 2. Less than 20 percent of the Southwestern land belongs to these two groups and only a trifle over 10 percent in Southern territory. This situation continues to be true when Grade 3 land is included, about 60 percent of Western Trunk Line area being in grades from excellent to fair, as compared [fol. 5623] with over 55 percent for Official classification territory, about 50 percent for Southwestern, and nearly 42 percent for the Southern area.

Although nearly all the land in the Mountain-Pacific division belongs in Grades 4 and 5, this figure is somewhat misleading because some of this Grade 4 and 5 acreage is under irrigation. In addition, there are also considerable areas of irrigated land in both Western Trunk Line and Southwestern territories. The data in Table 38 show that irrigation enterprises are capable of supplying water to over 26 million acres of land, about 83 percent of which is located in the Mountain-Pacific division. The figures shown in this table with regard to irrigable lands are to be taken as a qualification of the grades of land distributed by freight rate territories shown in the preceding tables.

If we assume that all the land, for which present enterprises are capable of supplying water, are of Grades 4 and 5, and that irrigation would make them as productive as land of Grades 1 and 2, we have the comparison of territories shown in Table 38-A.

(Here follows 2 photolithographs, side folios 5624-5625)

Table 38. - Irrigable Lands of the Western States, by Freight Rate Territories 1/

Territories	Irrigable area that present enterprises were capable of supplying with water in 1940 2/		Ultimate irrigable area 3/	
	1,000 acres	Percent of total	1,000 acres	Percent of total

4 and 5	87,952	168,763	204,632	119,545	636,815	1,217,707
All grades	210,742	292,741	465,706	246,163	686,787	1,902,139
			Percent of U. S.			
1 and 2	19.51	9.74	49.26	13.92	7.57	100.00
3	16.40	26.31	27.27	22.98	7.04	100.00
4 and 5	7.22	13.86	16.80	9.82	52.30	100.00
All grades	11.08	15.39	24.48	12.94	36.11	100.00

1/ The variation between Grouping A and Grouping B is due to a difference in the allocation of states divided by freight rate territory boundaries as follows:

State	Grouping A	Grouping B
Michigan	Official	Western Trunk Line
Wisconsin	Western Trunk Line	Western Trunk Line
Virginia	Official	Southern
Louisiana	Southwestern	Southern
Colorado	Mountain-Pacific	Western Trunk Line

Sources: Tables 37 and 38.

[fol. 5626] Thus, by regarding land by arbitrarily assigning higher grades to lands capable of irrigation the percent of the better grades of land in the western territories is somewhat advanced. Mountain-Pacific territory, under the revised comparison, has approximately 7½ percent of the land of the U. S. of Grades 1 and 2 as compared with slightly over 1 percent under the original classification. This reclassification of lands places Mountain-Pacific territory about on a par with Southern territory with respect to excellent and good lands. The effect on Southwestern territory is opposite, changing the percent of U. S. total of Grades 1 and 2 from 15.78 in Grouping A and 14.41 in Grouping B to 15.19 in Grouping A and 13.92 in Grouping B. Thus, even though the better grades of land are increased, their relative standing in relation to other territories is decreased, due to the greater amount of increase in the United States total of Grades 1 and 2. The change also tends to lower the position of Western Trunk Line territory, although it is still the outstanding leader in excellent and good lands. The percents of the better lands in Official and Southern territories are naturally reduced somewhat due to the addition of approximately 27 millions of acres to the national total. The comparison of territories in relation to Grade 1 and 2 lands before and after taking irrigation into account follows:

Territory	Without considering irrigation		After considering irrigation	
	Grouping A	Grouping B	Grouping A	Grouping B
Official	25.94	21.17	23.90	19.51
Southern	8.03	10.57	7.40	9.74
Western Trunk Line	48.99	52.68	45.86	49.26
Southwestern	15.78	14.41	15.19	13.92
Mountain-Pacific	1.26	1.17	7.65	7.57

The data for ultimate irrigable area (Table 38) are based on estimates of State engineers and U. S. Army engineers and represent the maximum acreage for which water could be economically provided. The estimates were made for 17 States only, the data for Arkansas and Louisiana being provided by the 1930 census figures on area which enter- [fol. 5627] prises were capable of supplying with water in 1930. The State engineers' and Army engineers' estimates are somewhat higher than the Bureau of Reclamation estimates for the same 17 states. According to a statement of G. W. Lineweaver, Office of Information, Bureau of Reclamation, on March 25, 1941, the Bureau of Reclamation engineers estimate that there are approximately 22 million acres of land for which water can be economically provided in addition to the land in enterprises as of the Census of 1930. The State and Army engineers' estimate for the same 17 states is 26,436,050 acres.

Agricultural Resources as Measured by the Distribution of Land Used for Agriculture

Differences in agricultural resources apparently account in no small degree for variations between the territories in terms of the total agricultural income which has been discussed in a preceding section. In the following sections there are presented the data with regard to crop and livestock production with some attempt to relate these differences in production to the resources of these areas. The present section distributes the total land area of the United States according to freight rate territories and land use. The following sections analyze the distribution of production of various crops and livestock and livestock products between the freight rate territories.

Table 39 shows the present way in which the land area of the various freight rate territories is being used for agricultural purposes. Over 38 percent of the total land area of the United States is included in the Mountain-Pacific rate territory and nearly 21 percent in the Western Trunk Line freight area. The remaining acreage is divided rather equally between the remaining three territories, the difference between the three being slightly less than 1 point per cent of the total land area of the United States.

Examination of this table shows that Western Trunk Line territory leads in acreage of total farm land with just under 30 percent of the national total. The Mountain-Pacific division ranks second with a little over 22 percent, followed by Southwestern, Official, and Southern territories in the order named.

(Here follows 1 photolithograph, side folio 5628)

Data for states divided by freight rate territories were apportioned on the basis of county figures as shown in the Census reports of 1930. At the time this table was prepared, county figures were not released for the Census of 1940.

Total land area as of 1930.

rces:

Fifteenth Census of U. S., 1930, Agriculture, Volume II (state and county figures).

Sixteenth Census of U. S., 1940, Agriculture, "United States Summary", Special release, Feb. 5, 1941 (processed).

[fol. 5629] In terms of the potential crop land in 1940, however, the order of importance differs radically from this showing in certain respects. Potential crop land in 1940, as shown in the table, is the sum of the crop land in farms plus the plowable pasture land in farms as computed by the Census Bureau. On this basis, Western Trunk Line territory assumes a very much greater importance in comparison with the other territories than on the basis of the total land in farms, the potential crop land of this rate territory representing nearly 40 percent of the total for the United States. The Mountain-Pacific division, which ranks second in total land area in farms, shows a smaller acreage of crop land in farms and of plowable pasture in farms together than any other rate territory, with the result that the total potential crop land of this area in 1940 was only a little in excess of 11 percent of the total for the United States. In terms of potential crop land, second position is assumed by Official territory with approximately 20 percent of the total, followed by the Southwestern area with about 15.4 percent and the Southern territory with about 14.7 percent.

The total land in farms shown in the foregoing table does not represent all the land devoted to agricultural uses because there is an enormous proportion of the total land area of the United States outside of land in farms which is used for pasture. This acreage aggregates 31 percent of the total land area of the United States and is located for the most part, as of 1930, in the three western freight rate territories, more particularly in the Mountain-Pacific division. The acreages of these pasture lands for the western freight rate territories are as follows as of 1930:[1]

Territory	Pasture not in farms	Land area	Percent of land area
	(1,000 acres)		
Western Trunk Line	15,637	397,619	3.93
Southwestern	56,427	270,528	20.86
Mountain-Pacific	358,530	725,480	49.42
Total	430,594	1,393,627	30.90

---

[1] U. S. D. A., B. A. E., "Trends in Land Utilization, 1879-1929." Special table prepared for the I. C. C. by Claude C. Haren, Jr., Agricultural Economist, Land Economics Division, on June 19, 1940.

[fol. 5630] The relative disadvantage in 1940 of the Mountain-Pacific territory in terms of either crop land in farms or potential crop land in farms ~~is~~ somewhat offset by the enormous acreage available for grazing purposes. Similarly, the agricultural resources of both the Western Trunk Line and Southwestern territories are increased by the existence of this grazing land which is not shown by ~~the~~ figures of either crop land in farms or potential crop land as shown in the preceding table.

Agricultural Resources as Measured by Potential Production of Crops

Potential production of certain major crops for each territory was determined by applying the maximum yield per acre in the past to the maximum acreage in the past for each state comprising the territory. Maximum yield and acreage figures were obtained from the United States Department of Agriculture revised estimates[1] of acreage, yield, and production and cover the period 1879-1939, inclusive, with shorter periods for certain crops as indicated in the footnotes to tables for individual crops (Tables 53 to 74, inclusive). Data for states divided by freight rate territory boundaries were apportioned to territories on the basis of 1929 Census county figures for individual crops.[2]

This method of estimating potential production (by maximum acreage and maximum yield in the past) assumes that the same amount of acreage used in the production of a particular crop in the past can be called into production in the future if sufficient demand for that crop should arise. Variations in yields in the past appear to be due chiefly to weather and other random conditions rather than to long-term trends in yields per acre. According to H. E. Selby of the United States Department of Agriculture:

> [fol. 5631] "Average yields of important crops have not changed significantly for several decades, except for a decline in the average cotton crop as a result of boll weevil infestation, and a recent increase in corn crops through the use of hybrid seed.

---

[1] Revised by U. S. D. A. to provide comparable data throughout a series of years.

[2] For more complete discussion, see following section.

> "Apparently soil erosion and depletion and an extension of cultivation to inferior lands have been just about balanced by improved crop varieties and cultural practices and by shifts in production from depleted land to new land."[1]

In discussing the productivity of new lands brought into the production of wheat, O. E. Baker says:

> ". . . The new land brought into use for crops will be of lower productivity, but the higher yields per acre on the old lands resulting from the wider use of fertilizer and better cultivation will probably neutralize these lower yields."[2]

Potential production was computed for twenty crops for which revised figures on acreage and yield are available. These twenty crops in 1939 made up 94.83 percent of total harvested acreage of the United States, as computed previously in this report (see Table 44). The percent of all crops, by territories, of the 20 crops studied are as follows:

	Percent
Official	90.57
Southern	91.87
Western Trunk Line	98.79
Southwestern	97.82
Mountain-Pacific	88.22

[fol. 5632] A summary of the maximum acreage of the 20 crops is shown in Table 40. These acreage figures are only valid when considered individually because, obviously, if land is planted to corn, the same land cannot also be available for the production of wheat in the same year. In order to indicate that the maximum acreages are not fantastic figures, however, maximum acreages of all crops were added together for each territory and compared with potential cropland (see Table 39). This comparison is as follows:

---

[1] H. E. Selby, Bureau of Ag. Econ., U. S. D. A., "How Many Acres Do We Require?", Land Policy Review, Vol. III, September 1940, p. 10.

[2] O. E. Baker, Agricultural Economist, U. S. D. A., "The Potential Supply of Wheat," art. in Economic Geography, Vol. I, March 1925, p. 40.

Territory	Maximum acreage of 20 crops	Potential cropland 1939
	(1,000 acres)	
Official	99,605	106,628
Southern	69,739	77,763
Western Trunk Line	202,000	205,458
Southwestern	74,988	81,492
Mountain-Pacific	36,897	58,832
United States	483,229	530,173

Even if account is taken of the fact that the 20 crops do not cover all of the crop acreage, the maximum acreage figures do not seem excessive.

Table 41 shows a summary of potential production found by applying maximum yields to maximum acreages (discussed above). Discussion of potential acreage and production of individual crops is reserved for a later section in order that comparisons can be made with 1939 figures.

Agricultural Resources as Measured by 1939 Crop Production

General Discussion

The measurement of the agricultural resources of the freight rate territories in terms of present production of crops, livestock and livestock products has been based upon the year 1939. This has been done for two reasons. In the first place, the 1939 figures are the latest which are available at the present writing, and, secondly, these figures are

(Here follow 2 photolithographs, side folios 5633-5634)

Table 40.--Potential Acreage of Principal Crops, by Freight Rate Territories

[fol. 5635] relatively close to the average for recent years. From 1926 to 1939, for example, the total acreage harvested ranged from 296 to 364 million acres and the average for the period is about 341.6 million. For the year 1939 the total acreage harvested was a little under 325.5 million which is only 4.7 percent below the average for the entire period. Similarly the gross income from crops and livestock combined for the same period ranges from a little over 5.3 billion dollars to over 11.9 billion, the average figure for the period being a little over 9 billion. In 1939 the total gross income of almost 9 billion was only 1.2 percent below the average figure for the entire period.

Table 42 shows in detail the yearly figures on which the foregoing statements are based, together with the subdivisions of gross income as between crops and livestock. It will be noted that the crop and livestock figures for 1939 similarly fall well within the range of the total for the period and that the figure for crops is somewhat below the average whereas the figure for livestock is somewhat higher than the average.

(Here follows 1 photolithograph, side folio 5636)

Table 42. - Harvested Acreage of Principal Crops and Gross Farm Income from Crops and Livestock, United States, 1926-1939

Year	Acreage of 46 principal crops harvested	Gross income from		
		Crops	Livestock	Crops and livestock
	(1,000 acres)	(Million dollars)

U.S.D.A., B.A.E., "Gross Farm Income and Government Payments, 1936-1939," July 8, 1940 (mimeographed).

[fol. 5637] Data on acreage and production of principal crops by freight rate territories were taken from the preliminary figures of the United States Department of Agriculture published in "Agricultural Statistics," 1940.[1] Farm value by territories was computed by applying season average state prices, as reported in "Agricultural Statistics," to the production of the states comprising each territory.[2] Farm values computed from other preliminary data by the U. S. D. A. for certain major crops show slightly different figures.[3] Final price data were not available at the time the tables were prepared.

---

[1] Except data for sweet sorghums, which were not reported in this source, but were taken from U. S. D. A., "Crops and Markets," Dec. 1939, p. 273.

[2] Exceptions to this procedure are as follows:

(1) December 1 prices, rather than season average prices, were reported for tame and wild hay, dry field peas, velvet beans, and sugarcane for syrup.

(2) Farm value of commercial truck crops was reported in "Agricultural Statistics," making no computation necessary.

(3) Prices were not reported for sugar beets, hence farm value of this crop was taken from "Farm Production, Farm Disposition, and Value of Principal Field Crops, 1937-1939," U. S. D. A., Agricultural Marketing Service, April 1940.

(4) Neither farm value nor farm prices were reported by states for sweet sorghums, which made it necessary to apportion the United States total farm value to territories on the basis of production.

[3] The following is a comparison of the farm values used in this report with the farm values computed by the U. S. D. A. from later preliminary figures for certain major crops:

	As computed in this report	As reported by U. S. D. A.
	(1,000 dollars)	
Corn	1,464,339	1,473,773
Hay, tame and wild	641,691	654,838
Wheat	510,674	534,661
Oats	276,909	289,693
Barley	111,702	110,684
Soybeans	67,489	70,887
Sweet potatoes	54.415	54,442

[fol. 5638] Census county figures for 1929 were used as the basis for apportioning 1939 state figures to territories for those states which are divided by freight rate territory boundaries (Michigan, Wisconsin, Virginia, Louisiana, and Colorado).[1] Generally the state figures for each crop were apportioned on the basis of the acreage of that crop harvested in 1929. Cases in which acreage harvested in 1929 was not obtainable were apportioned on the basis of production in 1929.

The crops included in this study represent 329,814,000 harvested acres or 99.64 percent of the 331,015,000 acres reported in the summary of crops harvested shown in "Agricultural Statistics," 1940.[1]

---

[1] Counties divided by freight rate territories are allocated as follows:

In Wisconsin:

Dane, Green, Jefferson, Milwaukee, and Waukesha counties to Official territory;

Iowa and Lafayette counties to Western Trunk Line territory;

In Virginia:

Brunswick:

Brunswick, Charlotte, Lunenburg, Montgomery, Nansemond, Norfolk, Pittsylvania, Pulaski, Greensville, and Southampton counties to Southern territory;

Bedford, Campbell, Giles, Isle of Wight, Prince Edward, Roanoke, and Sussex counties to Official territory;

In Louisiana:

Ascension, Orleans, Plaquemines, and St. John the Baptist parishes to Southern Territory;

Iberville, Jefferson, St. Charles, and St. James parishes to Southwestern territory;

In Colorado:

Adams, Arapahoe, Denver, Douglas, El Paso, Las Animas, Pueblo, and Weld counties to Western Trunk Line territory;

Boulder, Huerfano, Jefferson, and Larimer counties to Mountain-Pacific territory.

All of Wyoming was allocated to Mountain-Pacific territory, and all of West Virginia was allocated to Official territory. All counties in the lower peninsula of Michigan were allocated to Official territory and all counties in the upper peninsula to Western Trunk Line territory.

[fol. 5639] Table 43 gives a summary of acreage harvested and the value of crops by freight rate territories in 1939. Western Trunk Line is outstanding in the number of acres harvested, this territory accounting for nearly 39 percent of the United States total. This figure is not far from double the nearly 22 percent of the total United States acreage which was harvested in Official classification territory and is almost exactly equal to the combined total for the Southern, Southwestern, and Mountain-Pacific divisions (39.25 percent). Although the Mountain-Pacific division includes about 38 percent of the total land area of the United States (Table 39), the territory accounts for slightly less than 9 percent of the total acreage harvested in the United States. This situation is no doubt related to the fact that almost 84 percent of this area is classified in the National Resources Committee's report as incapable of tillage and that less than 5 percent of the remaining area is land classed as excellent to fair (Table37).

Although Western Trunk Line territory far outstripped Official territory in 1939 in the proportion of the total crop acreage harvested, Official classification territory led the Western Trunk Line area in the total dollar value produced by a little over 2 points percent, a comparatively narrow margin (27.64 percent against 25.41 percent). Southern territory ranked third with a little under 21 percent of the crop value while the Southwestern and Mountain-Pacific divisions both fell below 14 percent of the total.

The proportions of crop value produced in Official, Southern, and Mountain-Pacific territories outranked the proportions of total United States acreage harvested in these areas whereas the reverse is true for the Western Trunk Line and Southwestern territories. These differences in ranking of the territories in acreage and crop value are accounted for, of course, by the difference in the average value produced per acre. Western Trunk Line territory with nearly 39 percent of the total acreage harvested showed the lowest average value of crops produced per acre ($10.67) while Mountain-Pacific division with far and away the smallest amount of acreage harvested reported the highest average value produced per acre ($26.10). The differences in total value produced per acre are due in considerable measure to the differences in the type of crops grown as well as to the differences in yields per acre and prices per unit.

[fol. 5641] *Acreage Harvested for 29 Principal Crops*

Table 44 shows the acreage of each of the 29 principal crops harvested for the United States and for each of the freight rate territories.[1] It also shows the percent distribution of the U. S. Acreage of each crop by territories and the percent distribution of the crops within each freight rate territory. Only 5 crops, corn, tame hay, wheat, oats, and cotton had a total harvested acreage of 20 million acres or more, and these five crops accounted for 78 percent of the entire acreage harvested in this country in 1939. Table 47 following shows that these 5 crops also account for nearly 63 percent of the total farm value of the principal crops. It is obvious, therefore, that these 5 crops exercise a profound influence on the agricultural economy not only of the United States as a whole, but also of the various freight rate territories.

In wheat, corn, and oats Western Trunk Line leads all others in acreage harvested. Southwestern leads in cotton, and Official territory in tame hay. However, if tame hay and wild hay are combined, the Western Trunk Line territory leads in total hay acreage. In corn and oats Official territory ranks second, but is somewhat outranked by the Mountain-Pacific territory in wheat. Southern territory, of course, ranks second to Southwestern in the production of cotton.

---

[1] Duplicated acreages have been eliminated in so far as possible, hence the number of crops for which acreage is shown is considerably less than the number of crops for which production and value are shown. Furthermore, since acreage for individual fruit and nut crops was not reported, acreage for all fruits and nuts as of 1939 (5,344 acres) was apportioned to freight rate territories on the basis of the territorial distribution of land in orchard fruits, vineyards, and planted nut trees as reported in the Census of 1930. The acreage of fruits and nuts by territories, therefore, should be considered as only approximate.

Total, all crops	21.83	16.01	38.92	14.51	8.73	100.00

1/ Preliminary.

2/ Included in total crop acreage, but largely interplanted in corn.

3/ Omitting alfalfa seed, red clover seed, lespedeza seed, and cottonseed. Also omitting 10,315,000 acres of annual legumes cut for hay, grazed, hogged, or plowed under and an undetermined acreage of farm gardens and other minor crops. The acreages shown include some crops harvested in succession from the same land and a few interplanted items.

4/ Less than .005 percent.

U.S.D.A., "Agricultural Statistics," 1940.
U.S.D.A., "Crops and Markets," December 1939.
U.S.D.A., "Farm Production, Farm Disposition, and Value of Principal Field Crops, 1937-1939, by States," April 1940 (mimeographed).
Fifteenth Census of U. S., 1930, Agriculture, Volume II (state and county figures).

[fol. 5645] Besides these five crops (corn, tame hay, wheat, oats, and cotton), eight other crops (barley, wild hay, grain sorghums, sweet sorghums, fruits and nuts, soybeans for beans, rye, and potatoes) each account for in excess of 3 million acres harvested. The total of these 8 crops for the United States represents a harvested acreage about the same as that represented by wheat. For 4 of these 8 crops Western Trunk Line territory leads all other territories in acreage harvested (barley, wild hay, sweet sorghums, and rye). Official territory outranks all other territories in 3 of these 8 crops in terms of acreage harvested (potatoes, soybeans for beans, and fruits and nuts). Southwestern leads in acreage harvested in the eighth of these crops (grain sorghums). Second position goes to Mountain-Pacific territory in barley, wild hay, and fruits and nuts, and to Western Trunk Line in grain sorghums, soybeans for beans, and potatoes. Hence Western Trunk Line territory ranks either first or second in the acreage harvested for 7 of these 8 crops. Southwestern is second in sweet sorghums and Official territory in rye.

Crop Production

The differences in value of crops harvested by territories (Table 43) are due primarily to differences in the production of the major crops. Table 45 shows the production in physical units of the principal crops in each territory. Obviously, the figures for various crops cannot be added to get territory totals because of the variation in units.

The following tabulation shows the number of crops in the production of which each territory ranks first or second:

	Number of crops	
Territory	Highest production	Second highest production
Official	8	9
Southern	8	6
Western Trunk Line	8	10
Southwestern	6	7
Mountain-Pacific	14	7

U.S.D.A., "Agricultural Statistics," 1940.

U.S.D.A., "Crops and Markets," December 1939.

Fifteenth Census of U. S., 1930, Agriculture, Volume II (state and county figures).

[fol. 5648] This tabulation over-emphasizes the position of Mountain-Pacific territory because of the large number of fruit and nut crops included in the table. When the crops are considered from the standpoint of national importance, a somewhat different picture is presented. For example, Western Trunk Line territory ranks first in the production of corn, wheat, and oats, three of the five most important crops from the standpoint of acreage, and second in the production of hay. In the production of the other two crops with a harvested acreage greater than 20 million acres, Southwestern territory ranks first in cotton, and Official territory ranks first in hay and second in corn and oats production. Southern territory ranks second in the production of cotton and Mountain-Pacific territory ranks second in the production of wheat.

In the following tabulation are shown the number of the ten most important crops from the standpoint of acreage (disregarding fruits and nuts) in which each territory ranks first or second.

	Number of crops	
Territory	Highest production	Second highest production
Official	2	2
Southern	0	1
Western Trunk Line	6	3
Southwestern	2	1
Mountain-Pacific	0	3

This tabulation indicates the outstanding position of Western Trunk Line territory in the production of the large acreage crops, ranking either first or second in 9 out of the 10 crops having the largest acreage.

Yield Per Acre by Crops

The value of production of principal crops depends upon the yield per acre as well as the acreage harvested. Table 46, which gives the yield per acre for each crop in each of the freight rate territories and for the United States as a whole in 1939, shows that except for sweet sorghums and corn the yield per acre in the Mountain-Pacific division

(Here follows 1 photolithograph, side folio 5649)

Sources:

U.S.D.A., "Agricultural Statistics," 1940.

U.S.D.A., "Crops and Markets," December 1939.

Fifteenth Census of U. S., 1930, Agriculture, Volume II (state and county figures).

[fol. 5650] exceeds the United States average for every one of the 21 crops produced in that area. Moreover, the yield per acre for 13 out of the 21 crops in this territory, for which comparisons are possible, or about 60 percent of them, is higher than in any other rate territory. This is presumably related to the extensive acreage under irrigation. Official territory is the only other area in which the yield per acre for a majority of its crops is above average. In this territory 17 out of the 25 crops for which average yield per acre is available show a higher than average productivity, including 3 (wheat, corn, and oats) of the 5 crops heretofore referred to as representing 78 percent of the acreage harvested and over 63 percent of the farm income. In tame hay and cotton, the other two of the 5 principal crops, its yield is below average although the acreage of cotton in Official territory is insignificant in any case. In all 6 of the crops in the 3 million to 20 million acre grouping, for which comparisons are possible, Official territory also shows a higher than average yield per acre. In the case of sweet sorghums and wild hay, however, the acreage involved is insignificant. One of these 8 crops, grain sorghums is not grown in Official territory and another, fruits and nuts, cannot be compared because no yield per acre is available. Each of the other 3 territories shows a lower than average productivity for a majority of the crops grown. Of these three, Western Trunk Line territory makes the best showing with a yield per acre higher than average for 10 crops and a below average yield for 15. Southwestern territory, however, shows a yield which is below average for 18 crops and above average for only 6. Southern territory, making an average showing somewhat better in 1939 than Southwestern territory, reported below average yields in 16 crops as compared with above average in 8.

Of the 5 major crops which bulk so extensively in the agricultural economy, Western Trunk Line is above average in corn, cotton, the acreage of which, however, is insignificant, tame hay, and oats, though the margin in both the latter crops is so narrow that the territory might more properly perhaps be regarded as average. Southern terri- [fol. 5651] tory shows a yield per acre above average for only cotton among the 5 crops showing an acreage harvested in excess of 20 million acres, and Southwestern territory is below average in the yield per acre for all 5 major crops.

A somewhat similar situation is found with regard to crops other than these 5. For the group showing from 3 million to 20 million acres harvested in 1939, Western Trunk Line territory is above average only in sweet sorghums, Southern in only sweet sorghums and wild hay, and Southwestern only in wild hay.

Farm Value of Individual Crops

Table 47 shows the territorial distribution of the farm value of crops harvested in 1939. The crops are arranged in order of national importance, and it is interesting to note the effect which a relatively few crops have on the national total value produced. For example, corn alone accounted for 27 percent of the total value and the four major crops, each having a value greater than ½ billion dollars (corn, tame hay, cotton, and wheat) accounted together for 60 percent. The 10 major crops,[1] each with a value greater than $100,000,000 accounted for 85 percent of the national total.

Of these 10 major crops, Official territory ranks first in the value of 3 (tame hay, potatoes, and apples) and second in the value of 5 (corn, wheat, tobacco, oats, and truck crops). Southern territory ranks first in the value of one (tobacco) and second in one (cotton). Western Trunk Line territory produces the highest farm value of 4 (corn, wheat, oats, and barley) and stands in second place in the value of 2 (tame hay and potatoes). Southwestern territory ranks highest in the value of one (cotton) and is second in none, and Mountain-Pacific territory ranks first in one (truck crops) and second in 2 (apples and barley). The dominance of Official and Western Trunk Line territories in the farm

---

[1] Cotton lint and cottonseed considered as one crop.

Fifteenth Census of U.S., 1930, Agriculture, Volume II (state and county figures).

[fol. 5655] value of the major crops is clearly demonstrated by this table. The relatively high standing of Southern territory (1.1 billion dollars, or 21 percent of the national total) is due to its high production of some of the less important crops and more particularly to its high production of tobacco and cotton.

Average Farm Price Per Acre of Individual Crops

Table 43 shows that although acreage harvested in Southern territory was nearly 27 percent below that in Official classification territory and much less than half that of the Western Trunk Line area, the total crop value produced in that territory is only 24 percent below that of Official territory and only 17 percent below that of Western Trunk Line territory. The same table shows that the value produced per acre in Southern territory is appreciably higher than that of Official territory and about twice that of Western Trunk Line area. An examination of Table 48, which presents the average farm prices for the principal crops of 1939,[1] indicates that this high value of total production and high value produced per acre is the result of the generally higher average farm prices prevailing in Southern territory as compared with the other freight rate territories. Of the 30 crops shown in this table for which comparison can be made, there were only 4 (velvet-beans, tobacco, oranges, and sweetpotatoes) for which the average farm price was not higher than the United States average. Not only is this true, but for a majority (17 out of 30) of these crops the farm price in 1939 was higher than the farm price in any other of the 5 freight rate territories. In contrast, the Western Trunk Line area shows a situation approximating the opposite of that in Southern territory. In this rate area there are only 9 of the principal crops (alfalfa seed, red clover seed, dry edible beans, sweetpotatoes, cranberries, apples, peaches, pears, and grapes), none of which are of first importance, that showed a price higher

---

[1] It should be noted that the crops listed in this table include some fruit and nut crops not listed in Table 46.

[fol. 5657] than the average for the United States. In addition, 13 of the 31 crops for which comparisons are possible showed prices lower than those of any other freight rate territory, including corn, oats, and tame hay, which as heretofore stated, are 3 of the 5 crops representing an acreage harvested in excess of 20 million acres each.

In the other three territories the differences in price per unit are not so pronounced, and in all three a majority of the crops showed a farm price higher than the United States average. In Official territory 17 crops showed a price above average while 14 were below. The former group, moreover, included wheat, oats, and tame hay, or 3 out of the 5 crops with a harvested acreage of over 20 million acres for the United States. All three of these crops are very important in this territory. Southwestern territory shows 19 crops above average in price and 11 below, while the Mountain-Pacific showed 14 above and 12 below average. In view of this showing the explanation of the much higher dollar yield per acre ($26.10) in the latter territory as compared with other freight rate areas (Table 43) must be found partly in the fact that this territory shows a much higher productivity in terms of the quantity produced per acre as was indicated in a preceding subsection discussing Table 46. The explanation is also partly to be found in the fact that Mountain-Pacific territory produces such a high proportion of fruits and nuts which have a high dollar yield per acre. Thus, the fruits and nuts studied in this report made up only slightly over 6 percent of the total acreage harvested in Mountain-Pacific territory, yet they accounted for 25.5 percent of the farm value produced in that territory.

[fol. 5658] *Agricultural Resources as Measured by 1939 Livestock and Poultry Production*

Production of Livestock and Poultry Products

Data on production and value of livestock and poultry and their products were taken from figures released by the U. S. Department of Agriculture. Figures for states which are divided by freight rate territory boundaries were apportioned to territories on the basis of Census county figures as of the Census of 1930. Inventories of livestock and poultry were used as the basis for apportionment, except that milk production in 1929 was used to allocate milk production and value in 1939.

Table 49 illustrates the dominant position of Official and Western Trunk Line territories in the production of livestock and poultry. Official territory ranks first in the production of milk, chickens, and eggs, and second in the production of cattle and hogs. Western Trunk Line territory ranks first in the production of cattle, hogs, and turkeys and second in the production of sheep, milk, chickens, and eggs. Southwestern territory shows the highest production of mohair (relatively unimportant) and the second highest production of wool. Mountain-Pacific territory ranks first in the production of sheep and wool and second in the production of mohair and turkeys. Southern territory ranks neither first nor second in the production of any of these commodities. Further discussion of the distribution of livestock and poultry production appears later in this report.

[fol. 5660] *Value of Livestock and Poultry Products*

Table 50 shows that the livestock and poultry studied in this report[1] acounted for over 5 billion dollars of farm value produced in 1939. The largest single item is milk[2] which accounts for 34 percent of the total and cattle, hogs, and milk together acount for 76 percent.

The first and second rankings of the territories in terms of value produced are identical with the rankings of physical prodüction discussed previously. In the total value produced by all the commodities Official teritory ranks first with 34.71 percent, closely followed by Western Trunk Line with 32.70 percent of the national total. Southern and Mountain-Pacific territories each produced about 11 percent and Southwestern territory falls in last position with 9.73 percent of the United States total.

Average Farm Value Per Unit

Average farm values by rate teritories were found by dividing total farm value by the total number of units produced. They do not represent average farm prices in all cases because in some instances there is no one unit of measurement in selling the commodity. For example, milk may be sold by the quart, or as cream, or even as butter.

---

[1] Does not include all livestock and poultry, since horses, mules, ducks, geese, and some others are not included.

[2] Gross income from milk is used in place of farm value to avoid duplication of the value of milk fed to calves. Also gross income of eggs is used to avoid duplication of the value of eggs used for hatching.

[fol. 5663] Official teritory prices are higher than the United States average for all commodities for which comparisons are possible. In contrast, Western Trunk Line prices are lower than the national average on all of the livestock commodities studied except two, cattle and sheep. The remaining 3 territories show a fairly equal distribution of prices above and below average. No general conclusions can be drawn from the prices alone, however, because of differences in quality and form of product. Selected prices are discussed more completely later in this report.

Relation of Agricultural Resources to Agricultural Products

Farm Products over 500 Million Dollars

The preceding pages of this report have given a summary of relationships of the freight rate teritories with respect to present acreage, production, and value of agricultural crops and production and value of livestock products. The present section attempts to show how the agricultural resources of the territories are reflected in the present production of the major agricultural commodities.

Table 52 shows the eight major crops and livestock products arranged in the order of their national importance as measured by value produced.[1] These eight commodities, each with a value greater than one-half billion dollars, accounted for approximately 60 percent of the value of all crops and about 87 percent of the value of all livestock products shown in Table 50.

---

[1] It should be noted that the figures for livestock and crops cannot be added together because a major part of corn and hay is consumed by livestock. Hence addition of the figures will include a duplication of value produced. Also, milk produced includes a certain amount of milk fed to calves causing a further duplication within livestock products. For a tabulation of value of livestock products with duplications eliminated, see Table 50.

Table 52. - Value of Principal Farm Products by Freight Rate Territories, 1939 1/
($500,000,000 and over)

[fol. 5665] *Dairy Products and Hay*

Milk and milk products accounted for over 19 precent of the gross agricultural income in 1939 (See Tables 36 and 50). Official territory leads in the production of milk with 36.18 percent of the U. S. total, and Western Trunk Line territory is next in importance with 35.76 percent (Table 49). The other territories in order of importance are Mountain-Pacific, 10.37 percent, Southern, 9.82 percent, and Southwestern, 7.87 percent. The differences in the relative importance of territories is more striking when farm values, rather than physical production, are compared. For example, Official teritory produces 43.25 percent of the farm value of milk and milk products while Western Trunk Line teritory, having nearly as much production, produces only 25.02 percent of the farm value. Southern territory falls in third place with 12.81 percent followed by Mountain-Pacific and Southwestern territories in the order named. The differences in physical production are not due alone to number of cows kept for milk, but also to the yield of milk per cow. The following tabulation shows the data with respect to yield:[1]

Territory	Milk cows on farms		Average production per cow
	(Thousands)	(Percent)	(Lbs.)
Official	7,885	32.96	4,981
Southern	3,180	13.29	3,351
Western Trunk Line	8,237	34.43	4,713
Southwestern	2,681	11.21	3,189
Mountain-Pacific	1,940	8.11	5,805
United States	23,923	100.00	4,538

Comparing these figures with Table 51 we see that Southern territory, having the lowest yield per cow, has the highest farm value per hundred pounds ($2.13). Official terri- [fol. 5666] tory with the next highest price[1] of $1.95 has the second highest yield per cow. Southwestern and Mountain-Pacific territories have the same average price but the yield per cow in Mountain-Pacific territory is 82 percent greater than in Southwestern territory. Western Trunk Line territory has the lowest price per unit, but the yield per cow of this territory is above the United States average.

---

[1] Price is not to be construed as price per unit of whole milk, but rather as average farm value of milk and milk products per 100 pounds of milk produced.

[1] U. S. D. A., "Agricultural Statistics," 1940, p. 429. Data for states divided by freight rate territory boundaries apportioned to territories on the basis of the milk produced in 1929 (Census county figures).

It is significant to note that Official and Western Trunk Line territories, having the highest total production and also higher than average yields per cow, are also outstanding leaders in the production of tame hay. Official territory produces 35.43 percent of the United States total tame hay and Western Trunk Line territory 30.06 percent. Differences in price per ton change the percents of U. S. farm value of tame hay to 40.36 percent in Official and 21.79 percent in Western Trunk Line territory. Another interesting observation is that prices of tame hay follow almost identically the same pattern by territories as do prices per hundred pounds of milk. Southern territory prices of both tame hay and milk are highest with Official territory in second place. Western Trunk Line territory has the lowest prices of both. Mountain-Pacific and Southwestern territories have the same milk prices but the price of tame hay is higher in Southwestern territory.

Since hay and dairy regions tend to coincide for large sections of the United States the reasons for their location in particular areas must be discussed together. Location of the hay and dairy region (Map 3) in Official and Western Trunk Line territories is due to a variety of factors, chief among which are apparently physical conditions. Finch and Baker say in this connection:

> "* * * This development of the dairy industry in the northeastern section of the United States is due to several causes, among which may be mentioned the proximity to the large city markets, especially im-

> [fol. 5668] portant in the production of market milk, and the cool summer climate which favors the production of dairy products of high quality, and although often preventing the proper maturity of corn for grain, permits its production for silage. The climate of the Northeastern States has also resulted in making them the most important hay-producing region in the United States, and a market for this hay is secured by keeping dairy cows. The relatively large summer rainfall, especially in the western section of the region, is also an important factor, since it promotes the maintenance of green pastures which greatly reduces the agricultural work of the summer so far as the feeding of cattle is concerned . . ."[1]

The less favorable conditions in other sections of the United States accounts principally for the lack of dairying except to supply local demand. The hitherto relatively low development of dairying in the South is caused not alone by physical conditions, but by a great variety of economic conditions, chief of which seems to be specialization in cotton production. In this connection Sherman F. Johnson of the U. S. Department of Agriculture says in speaking of the soil conservation problem:

> "In periods of high cotton prices the relative returns for the use of land in alternative enterprises favored specialization in cotton, and the resulting income in those years provided somewhat more adequately for the farm population. However, the high percentages of land in cotton and in corn for mule feed developed a soil-erosion problem that has increased in seriousness in recent years. With lower incomes from cotton and no alternative employment for the farm population, the pressing need for cash income makes it extremely [fol. 5669] difficult to establish a type of farming that will maintain soil resources. The smaller the farm, and therefore the more inadequate the present production base, the more difficult it is to effect the adjustment.

---

[1] V. C. Finch, Assistant in Agricultural Geography (Assistant Professor of Geology, University of Wisconsin) and O. E. Baker, Agriculturist, U. S. Dept. of Agriculture, "Geography of the World's Agriculture," 1917, p. 120.

> Soil conservation requires the use of winter cover crops and the retention of part of the land in grass and other close-growing crops. To establish such a rotation requires cash outlay, and the immediate cash returns are likely to be less than for cotton. Thus the extreme pressure for cash income furnishes an effective resistance to change."[1]

In explaining the lack of hay production in the South Finch and Baker sum up the reasons as follows:

> "The Southern States have a small hay acreage for several reasons: (1) A system of agriculture based almost entirely on cotton and corn, which are more productive and more restricted in their geographic range; (2) small farms, lack of capital, and a credit system which makes cash crops of primary importance; (3) the absence of a beef and dairy industry, due in part to the warm climate, the cattle tick, lack of ice for refrigeration, unskilled character of labor, and the limited local markets; (4) the prevalence of tenancy and the migratory character of the tenants, which discourages crop rotation; (5) frequent summer rains and high humidity detrimental to curing hay; (6) a considerable amount of waste land, the result of erosion of the surface soil, on which it is difficult to secure a good catch of grass; (7) climatic conditions to which northern hay crops are not adapted, and the absence of good perennial grasses and legumes.
>
> [fol. 5670] "The rapidly extending use of the cowpea in the South, and the more frequent utilization of Bermuda grass and Johnson grass, combined with the growth of cities, improved transportation facilities, and increase of capital, which may be expected to result in a moderate development of dairying and other livestock enterprises, promise in large measure to correct these adverse conditions."[1]

[1] Op. cit., p. 104.

The importance of hay to Mountain-Pacific territory (28 percent of total acreage harvested is due partly to the lack of other suitable crops and partly to the fact that hay can be converted into animal products whose concentrated value will bear the cost of long-distance transportation.[2]

Tables 53 and 54 indicate that Southern and Southwestern territories have never been large producers of hay, since the figures which make up these tables are taken from maximum acreages and yields in the past. The tables also indicate that if all of the land which has ever been used for hay in the past were put back into the production of hay again at the highest yield attained at any time in the past the relative standings of the territories would still be unaltered.

Corn

Corn is the most important crop from the standpoint of value, accounting for 27 percent of the farm value of all crops harvested in 1939 (see Table 47). Official and Western Trunk Line territories together produced 77.63 percent of the value of all corn (38.43 percent in Official territory and 39.20 percent in Western Trunk Line territory). Southern territory falls in third place with 15.45 percent of the total. The leading position of Official and Western Trunk Line territories is even more pronounced when physical production, rather than farm value, is compared.

Fifteenth Census of U.S., 1930, Agriculture, Volume II (State and county figures).

[fol. 5673] Western Trunk Line leads with 41.52 percent of the U. S. total followed very closely by Official territory with 39.66 percent. Either one of these territories produces more than twice the corn of the other three territories combined. In spite of this fact, corn is an important crop to Southern territory as well, a larger portion of the harvested acreage being planted to corn than to any other crop. Judged from the standpoint of the ratio of corn acreage to total acreage harvested, corn is more important to Southern territory than to any other territory. It accounts for 41.33 percent of the harvested acreage in Southern territory as compared to 30.82 percent in Official, 26.61 percent in Western Trunk Line, and 20.68 percent in Southwestern territory. (Table 44.) The relatively lower standings of Southern and Southwestern territories when production rather than acreage is used as a basis for comparison are due to the low yields in these areas. From Table 46 the yield per acre is 15.0 bushels in Southern territory and 15.5 bushels in Southwestern territory as compared with 46.8 bushels in Official and 31.8 bushels in Western Trunk Line. This accounts for the fact that while Southern territory has 24.57 percent of the corn acreage harvested, yet it has only 12.46 percent of the total corn production. The differences in corn yields may be attributed partially to the introduction of hybrid corn into the corn belt states in recent years. The use of hybrid corn has not spread to the western states because moisture limitations to yields would not make it profitable. "Rather slow adoption of hybrid corn in the South seems to be indicated because of the greater cost, relatively low corn yields, and the fact that corn is not a southern cash crop. Insect damage makes it difficult to maintain inbred lines of corn in that section, and may mean that the cost of producing hybrid seed in the South will be greater than in the Corn Belt."[1] Its use in the corn belt, however, will probably increase and the U. S. Dept. of Agriculture estimates that eventually, perhaps before 1950, 80 to 85 percent of the corn acreage in this area will be planted to hybrids.[2]

Reference to Table 55 indicates that the relative position of the freight rate territories remains unchanged when po-

[fol. 5675] tential acreage and production are considered rather than 1939 acreage and production. Western Trunk Line territory somewhat advances its lead over Official territory, however. The figures show that, although corn acreage and production could be increased materially in all territories, the greatest increase could be effected in Western Trunk Line territory (approximately 1.2 billion bushels). They also indicate that the potential production (based on past experience) of Southern, Southwestern, and Mountain-Pacific territories combined would no more than equal the 1939 production of either Official or Western Trunk Line territories.

The reasons for the location of the corn belt in southern sections of Official and Western Trunk Line territories and the northern section of Southern territory (Map 3) are primarily physical reasons. The physical limitations to corn production are set forth by Finch and Baker as follows:

> "The western limit of extensive corn production in the United States follows more or less closely the line of mean summer (June, July, and August) precipitation of 8 inches, * * * Practically no corn is grown where the mean summer temperature is less than 66°. * * *
>
> "Although corn is thus grown to some extent under a wide range of climatic conditions, the most favorable environment is definitely restricted in area. The climatic boundaries of the region of greatest production in the United States are a mean summer temperature of 70° to 80°, a mean night temperature exceeding 58°, a frostless season of over 140 days, and an annual precipitation of 25 to 50 inches, of which 7 inches occur during July and August. The best corn soils are fertile, dark colored loams or silt loams, warm, well drained, and well supplied with humus."[1]

Thus we can state, in general, that average summer precipitation establishes the western limit to profitable corn production (Map 11) and that the northern limit is set

[fol. 5679] principally by temperature (Map 4). The southern limit of the corn belt is not set by physical conditions, but is set by competition with cotton. Cotton, having a higher productivity per acre forces corn production further north, except corn which is grown primarily for local consumption.[1]

Corn is grown principally in the rich Chernozem and Prairie soils in Western Trunk Line territory and in the Gray-Brown Podzolic soils in Official and Southern territories (Map 7). Although the Gray-Brown Podzolic soils are generally acid and have only medium fertility (Table 56), they are "responsive" to applications of lime and fertilizer. Charles E. Kellog, Principal Soil Scientist, U. S. Department of Agriculture,[2] states, "Considering their medium fertility * * *, together with the desirable climate which allows the growth of a wide variety of plants, these soils are admirably adapted to the development of stable agricultural communities of the general farming type * * *" Although this region is considered to be a part of the "corn belt", it raises such a variety of crops that it might just as well be called the "general farming" region.[3]

Meat Animals

Western Trunk Line territory is outstanding in the production of the principal meat animals, producing 46.92 percent of the total weight of hogs and 39.51 percent of the live weight of cattle and calves. Official territory falls in second place with 29.35 percent of the hogs and 21.83 percent of cattle and calves. Southern territory ranks third in production of hogs with 12.62 percent of the total, and

[fol. 5682] Southwestern territory ranks third in production of cattle and calves (15.54 percent) followed very closely by Mountain-Pacific territory with 15.08 percent of the total. Production of these two types of livestock follows rather closely the production of the principal feed crops. For example, Western Trunk Line territory, which leads in the production of hogs and cattle, produces 42 percent of the corn, 57 percent of the oats, 65 percent of the barley, 70 percent of the rye, 32 percent of the grain sorghums, 30 percent of the tame hay, 65 percent of the wild hay, and 65 percent of the sweet sorghums of the United States. Official territory, falling in second place, produces 40 percent of the corn, 29 percent of the oats, 21 percent of the rye, and 35 percent of the tame hay of the United States. The relatively high percents of cattle and calves produced in Mountain-Pacific and Southwestern territories are undoubtedly due to the extensive grazing areas.

A comparison of cattle prices shows that Official territory has the highest farm prices of $7.65 per hundred pounds followed by Western Trunk Line with $7.62. Southern territory shows the lowest price per hundred ($5.98). Mountain-Pacific prices are highest on hogs ($6.79) followed in second place by Official territory with $6.59. Southwestern teritory prices are lowest ($5.94). Very little information can be gained from this comparison of prices, however, since there are undoubtedly great differences in the kind and quality of animals produced. For example, a portion of the cattle and calves are produced to replace existing dairy herds (especially in Western Trunk Line and Official territories), but no figures are available through which this portion can be ascertained.

Cotton

Cotton, the second most important crop and the most important strictly cash crop, accounted for about 12 percent of the farm value of crops harvested in the United States in 1939. The major part of the cotton production is divided about equally between Southern and Southwestern territories (43 percent and 47 percent, respectively). It accounted for 25.45 percent of the farm value of crops harvested in Southern territory in 1939 and 44.71 percent of the value of crops in Southwestern territory, and is the

Map 8

[fol. 5684] most important crop in the latter area both from the standpoint of acreage harvested and value produced. Farm value of cotton in Southern territory was greater than the farm value of any other crop, although a larger acreage of corn was grown in 1939.

Reference to Table 57 would seem to indicate that even though acreage of cotton might be doubled (based on maximum acreages in the past) the relative position of Southern and Southwestern territories would remain almost identical. For example, Southern territory harvested 39.10 percent of the cotton acreage in 1939 which compares with its 39.24 percent of the potential cotton acreage. Likewise Southwestern territory with 56.74 percent of the acreage harvested in 1939 has 57.42 percent of the potential cotton land (as computed by this method). The positions of the two territories are only slightly different when potential production data are compared, the slight difference being due to a greater spread in the case of Southwestern territory between 1939 and maximum yields.

Cotton has a very limited area in which it may be grown since it is limited on the north by the mean summer temperature line of 77° and a frostless season of 200 days (Maps 4 and 6) and is limited on the west by the line of mean annual precipitation of 23 inches (Map 9).[1]

Furthermore, autumn rainfall must be light in order to facilitate picking. Map 12 shows that there is heavy fall precipitation along the Gulf coast, which is one of the factors setting the southern limit to the cotton belt. Cotton is grown principally on the Red and Yellow soils of Southern territory and parts of Southwestern territory (Map 7) and on the rich "Black Prairie" and Chernozem soils of Texas.

Chickens and Eggs

The production of eggs is most heavily concentrated in Official territory, which produces 38 percent of the United States total. Western Trunk Line territory is the second largest producer with 30 percent of the total. Southern,

[fols. 5691] Southwestern, and Mountain-Pacific territories produce 12, 10, and 10 percent respectively. Average farm prices of eggs as of 1939 vary from 14¢ per dozen in Western Trunk Line territory to 20¢ in Official and Mountain-Pacific territories. Prices in Southern territory (18¢) and Southwestern territory (15¢) are very near the United States average of 17¢. The considerable variation in prices between Official and Western Trunk Line territories (20¢ and 14¢, respectively) helps to account for the fact that Official territory produces 43 percent of the United States total value as compared with 24 percent in Western Trunk Line.

The production of chickens follows fairly closely the production of eggs as outlined above, except that Southern territory produces relatively more chickens than eggs and Official territory relatively less. The importance of chickens and eggs in the national diet may be demonstrated by the fact that their aggregate value in 1939 exceeded the total farm value of cotton and cottonseed by 38 percent and exceeded the total farm value of wheat by 75 percent. Their aggregate value was just 17 percent under the value of cattle and calves and 15 percent under the value of hogs.

Wheat

Wheat, having the third largest acreage of any crop, is produced chiefly in Western Trunk Line territory. This territory produced 42.57 percent of the national total in 1939, or approximately the production of Official and Mountain-Pacific territories combined (21.56 and 21.57 percent, respectively). Wheat, however, is very important to Mountain-Pacific territory which is demonstrated by the fact that it had a larger harvested acreage than any other crop in that area in 1939. Also the yield per acre in this territory is considerably above the national average. Western Trunk Line territory, which had the greatest acreage in 1939, had the lowest yield per acre, which accounts for the fact that although it had 52 percent of the harvested acreage of wheat it produced only 42 percent of the total wheat crop.

Map 3 shows the location of the principal wheat growing [fol. 5692] regions in the United States. The physical limits to wheat production are set forth by Finch and Baker as follows:[1]

Reference to the maps on temperature and rainfall indicates that the limits established above cover a very substantial portion of the eastern section of the United States. Wheat tends to be crowded out of the more productive regions, however, because of the competition of other crops, especially corn. In this connection Finch and Baker[2] state:

> [fol. 5693] ". . . Since corn is a highly productive crop, yielding on the average about twice as much

---

[1] Op. cit., pp. 14-19.

> "Although wheat is grown in several localities in the United States on an annual rainfall of less than 10 inches, it is generally not a safe crop where the mean annual precipitation is less than 15 inches • • • Where the rainfall exceeds 45 inches a year wheat does not thrive, partly because the soils in such regions have undergone more leaching than soils in subhumid regions, but principally because rusts and other fungus diseases are more prevalent. The difficulty of harvesting in rainy weather is also an important factor. • • •
>
> "Wheat is grown in the United States mostly on silt-loam and clay-loam soils and requires less humus than corn. Very little wheat is grown on sandy soils, since the yield is generally too small to be profitable. • • •
>
> ". . . In the humid eastern United States, the southern boundary of the winter-wheat belt follows the isotherm of 68° during the two months preceding harvest (June 15). Early-maturing varieties are a necessity along this southern margin because of the greater damage to late varieties by rust. • • • The northern frontier of winter wheat follows in a general way the mean winter temperature line of 20° • • •
>
> ". . . The northern limit of spring wheat is approximately the mean summer temperature of 58°, which is found in the United States only in the western mountains."

[2] Op. cit., p. 29.

> grain and, including the fodder, over three times as much food per acre as either wheat or oats, the corn crop in the United States, within its optimum geographic limits, reduces other crops, except cotton, to a subordinate position, and especially those which require labor at the same time of year."

Thus wheat tends to be crowded out of the more productive sections of Western Trunk Line and Official territories into the more arid Great Plains region.

Since wheat is adapted to a fairly wide range of climatic conditions the wheat acreage of the United States could be almost doubled as is evidenced by Table 58 which shows the composite maximum wheat acreages of the states comprising each territory. The greatest rate of increase over 1939 could be had in Southern territory (over 3 times) but the greatest aggregate increase in acreage could be obtained in Western Trunk line territory (23.5 million acres). Potential production, as shown, could only occur in case maximum acreage in the past should coincide with maximum yield which, of course, is very unlikely. The table indicates, though, that even with 1939 yields the production of wheat could be materially increased in all territories. If the acreage in all territories was increased up to the maximum, however, the relative positions of the territories would be approximately the same except that the ranking of Mountain-Pacific and Official territories in second and third places, respectively, would be reversed under such a comparison.

Farm Products of 50 to 500 Million Dollars

The next group of agricultural commodities, whose value in 1939 ranges from 50 million to 500 million dollars, accounts for another 28 percent of farm value of crops harvested; and the remainder of livestock products studied,[1] except for mohair.

---

[1] Among the livestock and livestock products not studied in this report are horses, mules, goats, ducks, geese, and honey.

5694

Fifteenth Census of U.S. 1930, Agriculture, Volume II (State and county figures).

V8905

[fol. 5695] Altogether, the crops whose farm value in 1939 exceeded 50 million dollars accounted for about 88 percent of the total farm value of all crops. They also accounted for all crops whose total farm value exceeded 1 percent of the total for all crops.

Table 59 shows that 88.08 percent of the tobacco harvested in 1939 was produced in Southern territory and that 10.72 percent was produced in Official territory. Tobacco can be grown throughout a wide range of latitude, but soil and climate have an important effect on the kind of tobacco grown. Official territory produces principally cigar leaf tobaccos and Southern territory produces principally chewing plug, granulated smoking, and cigarette tobaccos. Tobacco accounts for only 5.29 percent of U. S. farm value of crops produced in 1939, but it accounts for 21.75 percent of the farm value of crops in Southern territory; hence it is very important to this area.

Tobacco

Table 59 indicates that tobacco acreage could be nearly doubled in Official territory, but that this added acreage would still not materially increase the position of Official territory in relation to Southern territory. The acreage of tobacco harvested in Southern territory in 1939 amounted to 85 percent of the aggregate maximum acreages in the past of the states in Southern territory. It should also be noted that tobacco yields in 1939 were very nearly maximum yields.

Oats

Over half (56.78 percent) of the oats produced in 1939 were grown in Western Trunk Line territory and 28.62 percent in Official territory. Oats can be grown over a wide range of climatic and soil conditions, but grow best in cool, moist climates such as are found in the northeastern United States.[1] They form an important part of the crop rotation system in rotation with corn and also serve as a nurse crop for hay crops such as clover or timothy. Oats accounted for 5.14 percent of the value of all crops harvested in 1939.

[1/] Preliminary.

Sources: Tables 47 and 50.

[fol. 5698] The acreage and production of oats could be materially increased in all territories as is evidenced by Table 61. The greatest aggregate increase in acreage amounting to 8.3 million acres (based on past acreages of oats) could be obtained in Western Trunk Line territory although acreages in Official territory could be increased nearly as much (6.8 million acres). The figures indicate that none of the other territories have ever been large producers of this crop and that their aggregate potential production (based on maximum acreages and maximum yields in the past) only amounts to 16 percent of the United States potential production.

Commercial Truck Crops

Commercial truck crops are grown principally in Official and Mountain-Pacific territories (29.55 percent and 39.48 percent, respectively, of the U. S. total value in 1939). Southern territory ranks in third place with 19.54 percent. Commercial truck crops in 1939 accounted for 4.77 percent of the value of all crops harvested. Their importance to particular areas is much greater than this percent would indicate, however, since they account for 13.50 percent of the value of crops harvested in Mountain-Pacific territory and 5.10 percent of the corps harvested in Official territory.

Potatoes

Official territory produced 44.13 percent of the total potato crop in 1939, or approximately twice the production of either Western Trunk Line or Mountain-Pacific territory. The regions of heaviest production lie north of the corn belt partly because the cooler climate is more favorable and partly because of the competition of corn which requires labor at the same time of year.[1]

Potatoes, being the most widely distributed crop in the United States,[2] could be grown on a much greater area in

[1] Potential production of oats by freight rate territories was computed by applying the maximum yield (1879-1939) to the maximum acreage harvested (1879-1939) for each State comprising the territory. Data for States divided by territory boundaries were apportioned on the basis of acreage of oats harvested in 1929 (Census county figures).

[2] Preliminary.

[fol. 5700] all territories than at present. The crop shows a preference, however, for light friable soils with high humus contents and for cool climates with moderate rainfall. Its commercial production is limited by distance from markets since its value in relation to bulk is rather small. Considering these factors, the figures presented in Table 62 on maximum acreage, yield, and production may be a fair indicator of what can be expected in the future if the production of potatoes is increased. Thus we see that Official territory is likely to continue as the leading producer and that Mountain-Pacific territory may lose its position in second place to Western Trunk Line territory. Southern and Southwestern territories (judging from this basis) are likely to remain low producers.

Apples

Official territory produced 62.69 percent of all apples [1] in 1939. Mountain-Pacific territory ranks in second place with 24.99 percent. Production of apples is limited by both climatic and economic conditions. According to Finch and Baker:

> "The production of apples in commercial quantities does not extend much to the south of the line of 79° mean summer (June, July, and August) temperature, only a few trees, planted mostly for home consumption, being found below this line. The northward distribution ends approximately at the mean winter (December, January, and February) Isotherm of 13°, and the acreage is thin beyond the winter isotherm of 20°, except in Vermont, New Hampshire, and Maine, where the moister weather lessens the injury of the dry winter winds. The effect of the cold, desiccating northwestern winds is apparent on the map as far south as central Illinois and northwestern Indiana, while the influence of Lake Michigan in raising both the temperature and moisture content of the air is evident not only on the

---

[1] Total production (not reported for 1939) was estimated on the basis of the ratio of average total production for 1928-1937 to average commercial production for the same period.

> [fol. 5702] Michigan but also in lesser degree upon the Wisconsin shore. Very few apples are grown in the Great Plains area beyond the line of 18 inches rainfall during the six growing months, April to September, inclusive, except where irrigation is practiced."[1]

Within this wide range of territory the commercial production of apples is limited by market demand.

Sheep

Sheep and lambs and wool are produced chiefly in Mountain-Pacific territory (44.40 percent and 48.40 percent, respectively), probably due to the vast amount of rangeland which can be best utilized by grazing sheep. Other significant amounts of sheep and wool are produced in Western Trunk Line and Official territories, seeming to follow, in general fashion, the production of the principal feed crops.

Other

Soybeans are grown principally in Official territory (81.45 percent of U. S. total in 1939), and have become important as a crop only within the past fifteen years. Their use in manufacturing seems to indicate a much greater expansion in acreage and production in the future. Western Trunk Line territory ranks second with 13.59 percent of the total.

The remaining 12 crops for which potential production was computed (barley, rye, buckwheat, rice, grain sorghums, sweet sorghums, peanuts, flaxseed, sugarcane for sugar, sugarcane for syrup, sugar beets, and sweetpotatoes) are not discussed individually since none of these crops amounted to as much as 2½ percent of the total farm value of crops harvested in 1939. The tabular comparisons of potential figures with 1939 figures, however, are presented in the tables which immediately follow.

[1] Potential production of rice by freight rate territories was computed by applying the maximum yield (1904-1939) to the maximum acreage harvested (1904-1939) for each State comprising the territory. Data for States divided by territory boundaries were apportioned on the basis of acreage of rice harvested in 1929 (Census county figures).

[2] Preliminary.

[3] Percents not computed because data for 1939 are incomplete, figures being shown for Louisiana only. This fact accounts for the apparent impossibility in the yield column; namely, that the 1939 yield per acre for Southern Territory is higher than the maximum yield per acre for any year, including 1939. The maximum yield for Louisiana is 46.0 pounds in 1916.

[1] Potential production of grain sorghums by freight rate territories was computed by applying the maximum yield (1924-1939), including grain equivalent on forage acreage, to the maximum acreage harvested (1924-1939) for each State comprising the territory. Data for States divided by territory boundaries were apportioned on the basis of acreage of grain sorghums harvested in 1929 (Census county figures).

[1] Not included in "all tame hay."

[2] Potential production of sweet sorghums by freight rate territories was computed by applying the maximum yield (1924-1939) to the maximum acreage harvested (1924-1939) for each state comprising the territory. Data for states divided by territory boundaries were apportioned on the basis of acreage of sorghums cut for silage in 1929 (Census county figures).

[3] Preliminary.

[4] The apparent impossibility (that yield per acre for 1939 is greater than the maximum yield for any year, including 1939) is due to a weighting of state yields inherent in the method of computation. The only states in Official Territory for which figures are reported are Illinois and Virginia. Since maximum data for Illinois coincide with 1939 figures (acreage 28,000, yield 2.5 tons), and, since maximum data for Virginia (acreage 7,000, yield 2.0 tons) are considerably greater than 1939 figures (acreage 3,000, yield 1.67 tons); consequently, Virginia has less weight in the computation of 1939 yield for Official Territory than in the computation of the maximum yield for Official Territory.

[fol. 5715] *Diversification of Crops*

The number of major crops in each territory is important insofar as it determines to what extent each territory is dependent upon particular crops for its value of production. Table 47 shows that Official territory has only 2 crops which produce more than 10 percent of the total value of the territory. These are corn (37.78 percent) and tame hay (16.29 percent) and the two together have a greater value than all other crops. Eight crops produce between 1 and 10 percent each of the total value. These eight crops plus the two major crops account for 93.45 percent of the farm value as of 1939.

Southern territory has three major crops; cotton, 25.45 percent; tobacco, 21.75 percent; and corn, 20.02 percent of the total. These 3 crops account for approximately two-thirds of the farm value harvested in 1939. In addition, there are 10 crops with from 1 to 10 percent of the total which account for an additional 26.97 percent of the total value.

Corn is of such major importance to Western Trunk Line territory that it dwarfs all other crops by comparison since it accounts for 41.93 percent of the total value. Three other crops, wheat, oats, and tame hay, account for another 35.70 percent, hence the 4 major crops account for over 75 per cent of the total. Seven other crops each have more than 1 percent of the territory total value.

The agriculture of Southwestern territory is dominated by cotton production which accounts for 44.71 percent of the value produced in 1939. Three cereal crops, corn, wheat, and rice, account for another 27.88 percent and there are 8 other crops which each have over 1 percent of the territory total.

The farm value produced in Mountain-Pacific territory is widely distributed, since no crop accounts for more than 16.13 percent of the territory total. Three crops, tame hay, wheat, and commercial truck crops, account for 43.40 percent. There are 15 other crops which each account for more than 1 percent of the total, chief among which are, in the order of their importance, oranges, cotton, and potatoes.

[fol. 5716] When the figures on value produced are arranged according to major groups of crops,[1] they reveal more clearly the dependence of certain territories on particular types of crops. For example, Table 75 shows that, on the basis of 1939 value figures, Southern territory depends on special crops for 48.17 percent of its production. Of this percent 25.45 is cotton and 21.75 is tobacco. It also reveals that cereal crops are of greatest importance to Official territory (53.17 percent of the territory total) and Western Trunk Line territory (74.87 percent). Cereal and hay crops together make up 89 percent of the value produced in Western Trunk Line territory. Southwestern territory produces principally special crops, which make up 47.25 percent of the territory total. Of this percent (47.25) 44.71 is cotton. Mountain-Pacific territory produces mainly fruits and nuts, followed in order of importance by cereal crops, potatoes and truck crops, and hay and seed crops. Its value of production is thus fairly evenly distributed over several major groups of crops. Its major crop, fruits and nuts, is not grown generally throughout the United States, however, which tends to discount its position as the territory with the most widely distributed production (as shown by this method).

---

[1] The crops studied in this report are grouped as follows:

Cereal crops—corn, wheat, oats, barley, rye, buckwheat, rice, and grain sorghums;

Hay and seed crops—tame and wild hay, sweet sorghums, alfalfa seed, red clover seed, and lespedeza seed;

Annual legumes—dry edible beans, dry field peas, soy beans, cowpeas, peanuts, and velvet beans;

Special crops—flaxseed, tobacco, cotton, sugar-cane and sugar beets;

Potatoes and truck crops—potatoes, sweet potatoes, and commercial truck crops; and

Fruits and nuts—strawberries, cranberries, apples, peaches, pears, grapes, cherries, plums and prunes, oranges, grapefruit, lemons, and pecans.

(Here follows 1 Photolithograph, side folio 5717)

[fol. 5718] Table 76 shows a comparison of territories on the basis of how closely the crops grown in each territory conform to the national distribution of crops. In order to make this comparison, the acreage of each crop harvested in each territory was expressed as a percent of the total acreage of all crops harvested in the territory in 1939. The deviation of each territory from the national average was computed by subtracting these percents from the percents showing distribution of acreage by crops for the United States and by adding without regard to positive or negative signs. Hence, Western Trunk Line territory, with the smallest total deviation, raises crops which conform more closely to the United States average (judged from the standpoint of distribution of acreage) than any other territory. Official territory is next, followed in order by Southwestern, Southern, and Mountain-Pacific territories.

[fol. 5720] Chapter V

Rate Territory Distribution of Forest Resources

Forest Regions

In the description of physical conditions required for forests (moisture, temperature, topography, and soil), a Department of Agriculture Bulletin states that "trees present an exceptionally large and exposed extent of surface to evaporation; hence forests, in general, are more restricted than crops in the matter of moisture requirements. But forests are less restricted by low temperature, and are scarcely restricted at all by topographic and soil conditions. * * * In the matter of resistance to low temperature some forest trees, especially the spruce and fir, exceed any of the crops. Whereas 9,000 to 10,000 feet is the upper limit of crop production in Colorado, the timber extends upward to 11,000 and 12,000 feet. The mean summer temperature at this altitude is about 48° F. * * * with reference to stony or rough land and sandy soils in humid areas, forests show almost perfect adaption. Mountain slopes will produce almost as much timber as valley bottoms having the same soil, and the land meanwhile is being protected from erosion. Likewise relatively infertile sand will normally produce as many feet of pine timber annually as the most fertile land will of hardwood. For these reasons the mountain areas and the sandy lands of the United States, which jointly amount to about 400 million acres, are devoted largely to forest."[1]

"Different kinds of species of trees are found in natural association or mixtures and prevail in different portions of the United States. This is largely the result of varying conditions of temperature and rainfall or snowfall, and secondarily, of soil conditions."[2] According to Mattoon, [fol. 5721] there are six natural forest regions in continental United States: northern, central hardwood, southern, tropical, Rocky Mountain, and Pacific Coast région. (See Map 14). "Most of the trees of a given forest region are different from those in the others, yet a considerable number are found in at least two and a few in three regions, especially in the eastern part of the United States where the large regions integrade gradually. This difference in the predominance of various species is rather marked in the two forest regions of the western portion of the United States, divided partly at least by the extensive and nearly treeless interior basis extending from southeast Washington south to Mexico."[1]

[2] Wilbur R. Mattoon, Extension Forester, [U. S.] Forest Service, "Forest Trees and Forest Regions of the United States," U. S. D. A., Misc. Publication No. 217, September 1936, p. 33.

The northern forest region covers most of New England and New York, extends southward over the Allegheny Plateau and Appalachian Mountains to northern Georgia, and in the Lake States most of Michigan, Wisconsin, and Minnesota. This region "is characterized by the predominance of northern white pine, eastern hemlock, red and white spruces, gray paper, sweet, and yellow birches, beech, sugar maple, basswoods, and northern red and scarlet oaks. Each of these species varies in abundance in different parts of the region, and most of them are absent in some places. * * * The southern extension of the region is characterized by an abundance of oaks of various kinds, chestnut, black gum, yellow poplar, cucumber tree, black locust, and southern balsam fir"[2]

The northern forest region "was the first land in the United States to be logged and it now contains only insignificant areas of virgin timber. Cutting is going on mostly in small-sized timber which produces small dimension lumber * * *, pulpwood, and fuel wood."[2]

The central hardwood forest region extends (excluding the southern Appalachian Mountain country) from Connecticut westward to Southern Minnesota and south through the piedmont area and the Cumberland Plateau to the northern parts of Georgia, Alabama, and Mississippi and through Arkansas to eastern Oklahoma and central Texas. "Generally distributed over the region are white and black

[fol. 5723] oaks, mockernut and pignut hickories, American elm, red maple, and sycamore. The northern red and scarlet oaks of the northern division of the region give way in the southern division to the southern red, post, and willow oaks. Chestnut (formerly very abundant), shagbark hickory, sugar maple, and rock elm practically drop out, while shortleaf pine greatly increases in abundance, dogwood and eastern red cedar become commercially important, and Osage-orange and persimmon appear frequently. The Texas extension of the region comprises vast areas of small-sized trees of post, southern red, and blackjack oaks, mesquite, and a number of different junipers or cedars."[1]

"The forests of the [central hardwood forest] region furnish large quantities of high-grade hardwood lumber which has constituted the raw material for wood-manufacturing industries in many States, * * *. Memphis, Tenn., has for many years been the largest center for hardwood lumber in the country."[2]

The southern forest region covers the Atlantic and Gulf Coastal Plains from eastern Maryland to eastern Texas, including portions of Missouri, Arkansas, and Oklahoma.

> "The yellow pine forest of the Southeastern States afford the only remaining important source of large timber production in the eastern half of the United States. Interspersed with the pine-bearing lands are extensive river and creek bottom lands and swamps in which are growing stands of mixed hardwoods and southern cypress. * * * The natural conditions are a soil of relatively low agricultural value, abundant rainfall, long growing season, and many species of trees of high commercial importance. * * *
>
> "Four species of pines, namely, shortleaf, loblolly, longleaf, and slash, make up the bulk of the stands. These are mentioned in the order of their prevalence in passing from north to south across the region. [fol. 5724] Shortleaf pine is found over an extensive region from New Jersey south to Florida and west to Missouri, Oklahoma, and Texas. Its best growth is in the broad piedmont or hilly area between the moun-

---

[1] Ibid., p. 40.

[2] Ibid., p. 41.

> tains and the Coastal Plain. Loblolly pine grows extensively over the upper Coastal Plain. Mixed loblolly and shortleaf pines occur over a vast area in large timber holdings and on hundreds of thousands of farms. Over two-thirds of the total naval stores (spirits of turpentine and rosin) of the world is derived from the crude gum or resin of longleaf and slash pines growing in the southeastern part of the United States. * * *
>
> "Three other pines make a slight addition to the total amount; namely, the pond pine * * * in the acid lands and swamps of the Atlantic Coastal Plain; the sand pine of the sand barrens of Florida; and the spruce pine * * *
>
> "The lowland and swamp hardwoods, southern cypress, and an intermittent fringe of southern white cedar cover about one-third of the total area of the southern forest region. The prevailing hardwood trees are red (or sweet) gum, swamp black gum, and tupelo gum, willow oak, water oak, cottonwoods, willows, magnolias, and bays. * * *"[1]

Tropical forest region. "Two fringes of forest, made up chiefly of tropical tree species, occur along the coast in extreme southern Florida and in extreme southern coastal Texas. * * * Many kinds of hardwood trees, most of which are small and bear evergreen leaves and pulpy berries or stone fruit, make up the stand. A few are of some commercial or economic importance, like mastic or 'wild olive,' and the mangrove, whose impenetrable thickets hold the muddy banks, causing land to be built up, and form a protection against tropical hurricanes. * * *"[2]

[fol. 5725] The Rocky Mountain forest region covers a vast extent of mountains and high plateaus in the central-western part of the United States.

> "* * * It embraces over 40 isolated forest areas or patches, some of large size like that in western Montana, northern Idaho, and eastern Washington, and another in Colorado, New Mexico, and Arizona. Many are relatively small timbered tracts, lying on the

---

[1] Ibid., pp. 41-42.

[2] Ibid., p. 43

ridges and higher mountain plateaus, interspersed with great treeless stretches and sometimes widely scattered in large arid districts, as in parts of Nevada, Utah, and Arizona. * * *

"The change in forest cover as one ascends a mountain slope may be illustrated by the successive belts in the southern Colorado-New Mexico forest area. First, at altitudes ranging from 5,000 feet on moister situations to 6,000 feet on drier slopes occurs a belt of one-seeded, alligator, or Utah junipers and pinon, or nut pine; above it ponderosa (western yellow) pine which forms extensive forests over the highly dissected Colorado plateau; with Douglas fir and white fir mingling in the stand in the upper part of the belt, and often so predominating as to form pure stands at 8,000 feet; and finally Engelmann spruce over an extensive horizontal belt terminating at the upper portion at altitudes of 9,000 to 11,000 feet in a belt of alpine fir.

"In the northern Montana-Idaho portion of the Rocky-Mountain region, forest growth begins at elevations of 3,000 to 4,000 feet and, depending very much upon the exposure and soil moisture, extends upward to 6,500 to 7,000 feet. Limber and western pine blend at 4,500 feet. The maximum commercial forest growth occurs at about 5,000 feet with limber pine on the dry southern exposures and on the moister or [fol. 5726] northern slopes Engelmann spruce and alpine fir. Another important tree in the central portion of the region is lodgepole pine, a tall slender tree which grows in dense stands. * * *"[1]

The Pacific coast forest region extends from the northwestern portion of Washington through Oregon to Southern California.

"Stands of very large firs, pines, hemlock, and cedars characterize the Pacific coast forest region. These are dense in the coastal forests of Washington and Oregon. In the extreme southern portion, in southern California, the timbered lands are surrounded with margins of a dense growth of dwarf broadleaf trees known as 'chaparral'.

---

[1] Ibid., pp. 43-44.

"The big trees, or Sierra redwoods, of the Sierra Nevada mountains in central-eastern California reach enormous heights of over 300 feet and diameters up to 40 feet, and single trees contain up to 360,000 board feet of lumber. * * * The western red cedar, Douglas fir, and sugar pine of California all grow to heights of over 200 feet with diameters up to 12 to 15 feet. The western red cedar averages the largest of this group. Douglas fir, somewhat smaller, and sugar pine, with its thin rather smooth bark, range mostly from 6 to 9 feet in diameter. About four-fifths of the total standing saw timber of the country is found west of the Great Plains in the Rocky Mountain and Pacific coast forest regions. * * *"[2]

It should be noted that there are no statistics available on the distribution of the total stand of all forest trees mentioned above in connection with the description of various forest regions. The United States Forest Service, however, has released data on the stand of saw timber [fol. 5727] (on commercial forest land) by principal species and by regions for 1938. These data are discussed and presented in this report in the section on "Stand of Timber by Freight Rate Territories."

Original Forest Area

The original forest area of the continental United States is estimated to have been 822.2 million acres, excluding from 100 to 150 million acres of low-grade woodland and scrubs.[1] This acreage (822.2 million acres) constitutes 43.2 percent of the total land area of the United States.[2] "About 350,000,000 acres of forest land have been cleared for crops and pasture, but probably 50,000,000 acres of formerly cleared land have reverted to forest and brush, and about 25,000,000 acres are used for roads, railroads, cities, golf courses, etc."[3] By the close of 1938 the original forest land (822.2 million acres) had been reduced to 472.6 [fol. 5728] million acres,[4] or to 57.5 percent of the original forest area. Of the present area, 461.7 million acres constitute commercial forest land which, according to the definition by the United States Forest Service, is land capable of producing timber of commercial quantity and quality, and available now or prospectively for commercial use.[1] The remainder, 10.9 million acres, is commercially valuable land in parks, preserves, etc., withdrawn from timber use.[2]

---

[2] Land area of the United States is 1,903.2 million acres, exclusive of Alaska and the island possessions.

Forest Land a Multiple-Use Resource

Forest land serves at least five major purposes: timber production, watershed services, recreation, support of wildlife, and forage production.[3]

> "With few exceptions, major uses need not be mutually exclusive; on the contrary, millions of acres can be used for two or more of them simultaneously. This unique multiple-use quality of forest land is one of its greatest assets.

---

[3] Baker, supra, p. 21.

[4] Excluding 157.6 million acres of forest land chiefly valuable for purposes other than timber production, such as the oak-cedar breaks of Texas and Oklahoma, mesquite, pinon-juniper in the West, chaparral in Southern California, remote and inaccessible alpine ranges and other areas which appear to be permanently out of the commercial timber-producing class because of low productivity or extreme inaccessibility., Much of the area has an important value in protecting the water-sheds of navigable streams, preventing or reducing soil erosion, protecting wild life, providing game cover, etc.—U. S. D. A., Forest Service, "Forest Statistics: Area, Stand, Growth, and Drain" (prepared for Joint Congressional Committee on Forestry), 1939, Table 1 (processed).

[2] Ibid.

[3] R. E. Marsh, Acting Chief, and William H. Gibbons, Senior Forester, Division of Forest Economics, Forest Service, "Forest-Resource Conservation," The Yearbook of Agriculture, 1940, p. 461.

"The nature and extent of the multiple-use quality may be seen in the acreages that can be used for different purposes:

"(1) Commercial timber crops can be grown on some 462 million acres.

[fol. 5729] "(2) Nearly three-fourths of all forest land exerts a major or moderate influence on watersheds. Fully half exerts a major influence. The latter includes the steep slopes of the Rockies, Sierras, Appalachians, and other mountain ranges of the West and East, which are the main sources of most major streams; erosible soils like those of the Piedmont and the high bluffs along the Mississippi; and other areas like the Ouachita section of the Ozarks, where streamflow or run-off conditions are critical.

"(3) More than half of the forest area, mainly in the West and South, is grazed by domestic livestock.

"(4) Practically the entire area is suitable for wildlife.

"(5) Eleven million acres of land naturally suitable for timber use has so far been set aside exclusively for scenic purposes and recreation, in the form of parks, monuments, and other reservations. Much of the rest can also be used for recreation."[1]

It should be noted, however, that the discussion in the present study is limited to commercial forest land as a source of timber supply.

Forest Areas by Freight Rate Territories

The distribution of the original forest land and commercial forest area in 1938, by freight rate territories, is given in Table 77. This table and also Tables 78-84 have two sets of data for the same territories, representing differences in the groupings of the states used in the make-up of the rate territory figures. This variation between groupings is caused by a difference in the allocation of states, divided by freight rate territory boundaries (Michigan, Wisconsin, Virginia, Louisiana, and Colorado), to par-

5730

[fol. 5731] ticular rate territories. It should be noted that the assignment of Wisconsin to Western Trunk Line territory and Colorado to Mountain-Pacific territory in both groupings is due to the fact that portions of Wisconsin and Colorado lying in Official and Western Trunk Line territories, respectively, have insignificant forest area, and practically no stumpage at all.[1]

Table 77 shows that in both groupings forest areas in 1938 of the Official and Western Trunk Line territories decreased over 50 percent as compared with the original forest land in these territories. Forest areas (in both groupings) of the Southwestern territory declined nearly 50 percent, and of the Southern territory over 40 percent. The forest areas of the Mountain-Pacific territory, however, decreased only 16 percent. The United States Forest Service, referring to the utilization of the original forests, pointed out that "cutting has naturally been heaviest in the most fertile and most densely populated sections of the country."[2]

The United States Forest Service classifies commercial forest areas bearing timber of different character of growth as follows:

1. Saw-timber areas include areas characterized by timber large enough for sawlog (lumber) in accordance with the practice of the region[3] regardless of its actual use. Old growth areas bear uncut or lightly cut stands of mature saw timber; second growth areas support predominantly [fol. 5732] immature saw timber which has come in following removal of the old timber by cutting or other causes.

2. Cordwood areas bear stands characterized by timber too small for sawlog production but large enough for cord-

[2] Report on Senate Resolution 311, supra, p. 32.

[3] In 1938 the forest area of the United States was divided by the U. S. Forest Service into the following regions: Northeastern, Central, Lake, South, Columbia River Basin, California, South Rocky Mountain, and Plains.—For source see next footnote.

wood regardless of whether the stand is cut for this use or held for saw timber.

3. Fair to satisfactory restocking areas include lands on which at least 40 percent of the growing space is fully occupied by commercial species predominantly below cordwood size.

4. Poor to non-restocking areas include lands with less than 40 percent of the growing space fully occupied by commercial species predominantly below cordwood size.[1]

Of the total commercial forest area (461.7 million acres in 1938), 46 percent or 212.8 million acres is saw timber area of which 100.8 million acres is old growth and 112 million acres is second growth. The acreage of cordwood area constitutes 22 percent or 100.8 million acres. The remainder, fair to satisfactory and non-restocking areas, contributes 32 precent or 148 million acres.[2]

The distribution of commercial forest areas by character of growth and by territories in 1938 is presented in Table 78. This table shows that the following are the leading territories in commercial forest areas, by character of their growth: the Mountain-Pacific territory has in old growth acreage 63 percent of the U. S. total. The Southern territory in second growth acreage has 38 percent of the U. S. total in Grouping A and 49 percent in Grouping B. In its cordwood area there is 30 and 36 percent of the U. S. total in Groupings A and B, respectively, and in the total forest area 34 percent in Grouping B and 28 percent in Grouping A. Official territory ranks second in second growth acreage (19 and 24 percent) and in cordwood area (29 and 22 percent). The Western Trunk Line and Southwestern territories have the lowest total acreage (for percentages see Table 78).

[fol. 5735] *Stand of Timber by Freight Rate Territories*

Total Stand of Softwoods and Hardwoods by Character of Growth

The distribution of the total stand of timber on commercial forest land by type of material and by freight rate territories is given in Table 79. The total volume of standing timber, including both saw timber and cordwood, is estimated by the U. S. Forest Service at 519.3 billion cubic feet. Of this volume, 376.9 billion cubic feet, or 73 percent, is softwood and 142.4 billion cubic feet, or 27 percent, is hardwood. Saw timber constitutes 364.6 billion cubic feet, 70 percent of the total, and the remainder, 154.7 billion cubic feet, or 30 percent is cordwood.

Of the total volume of saw timber, 296.9 billion cubic feet (81 percent) is softwood and 67.7 billion cubic feet (19 percent) is hardwood. Eighty billion cubic feet of cordwood are softwood species and the balance, 74.7 billion cubic feet, are of hardwood species.

The distribution of total stand of softwoods and hardwoods by type of material and by freight rate territories (Table 79) according to the A and B state groupings shows that the Mountain-Pacific territory is outstanding in softwood saw timber (81 percent of U. S. totals in both groupings) and in cordwood trees of softwood species (65 percent). In hardwoods, the Southern territory leads in saw timber (36 percent) in Grouping A and 50 percent in Grouping B) and the Official territory ranks first in cordwood (50 and 43 percent in Groupings A and B, respectively). Official territory also ranks second in hardwood saw timber, followed by the Southwestern and Western Trunk Line territories. Mountain-Pacific territory ranks lowest in hardwoods.

Stand of Saw Timber by Character of Growth

The U. S. Forest Service estimated that the total stand of saw timber on commercial forest land in the United States is equal to 1,764 billion board feet (see Table 80)

he variation between Grouping A and Grouping B is due to a difference in the allocation of states divided by freight rate territory boundaries as follows:

State		Grouping A		Grouping B	
Michigan	Louisiana	Official	Southwestern	Western Trunk Line	Southern
Wisconsin	Colorado	Western Trunk Line	Mountain-Pacific	Western Trunk Line	Mountain-Pacific
Virginia		Official		Southern	

rce: U. S. Forest Service, "Total Stand of Softwoods and Hardwoods in the United States, by Type of Material and by Regions and States [in 1938]." A table prepared for Joint Congressional Committee on Forestry, 1939 (processed).

[fol. 5738] of which 1.493 billion board feet, 85 percent of the total, is in softwood species and 271 billion board feet, 15 percent, is in hardwoods. Softwoods are made up of 1,156 billion board feet of old growth (77 percent of total softwoods) and 337 billion board feet (23 percent) of second growth. Hardwood saw timber is composed of 111 billion board feet (41 percent of total hardwood) of old growth and 160 billion board feet (59 percent) of second growth.

The distribution of the stand of saw timber on commercial forest land by character of growth and by freight rate territories (Table 80) shows that the Mountain-Pacific territory leads in softwoods of old growth, and of second growth (92 percent and 43 percent of the U. S. total, respectively) and in the total saw timber (69 percent of the total stand of saw timber). Southern territory ranks first in hardwoods of old growth (41 and 57 percent of the U. S. total hardwoods for Groupings A and B, respectively) and in hardwoods of second growth (45 percent in Grouping B) and ranks second in softwoods of second growth (32 and 38 percent). The Southern territory is also second in the total stand of saw timber (14 and 18 percent of the U. S. total).

Official territory is the first in hardwoods of second growth in Grouping A (37 percent of the U. S. total) and it is the second in hardwoods of second growth in Grouping B (29 percent). It also ranks second in the hardwoods of old growth (28 and 12 percent for Groupings A and B, respectively). Southwestern and Western Trunk Line territories rank lowest in the order named.

Stand of Cordwood

There are some 2,455 million cords of wood in trees 5 inches in diameter up to saw-timber size, and in tops and limbs of saw timber trees.[1] The total stand of cordwood on various areas of commercial forest land shows the following distribution (taken from Table 82):

---

Restocking area:		
Softwood	29.4	1
Hardwood	80.4	4
Total	109.8	5
Grand total	2,454.8	100

The distribution of the stand of cordwood on commercial forest land by freight rate territories (Tables 82 and 82A) indicates that the Mountain-Pacific territory leads in the stands of softwood cordwood on softwood saw timber area (69 percent of the total cordwood on this area) and softwood cordwood area (67 percent of the total), and also in the total stand of softwood cordwood on the total forest area (67 percent). The stand of hardwood cordwood of the Mountain-Pacific territory, however, is insignificant (less than 1 percent). The Southern territory leads in the stand of cordwood on hardwood saw timber area (36 and 49 percent for Grouping A and B, respectively) and in the total stand of hardwood cordwood in Grouping B (37 percent). It is second in the total stand of softwood cordwood (14 percent for Grouping A and 18 percent for Grouping B). Official territory leads in the stands of hardwood cordwood on cordwood area (54 and 46 percent) and on restocking area (67 and 56 percent) and also in the total stand of hardwood cordwood in Grouping A (43 percent). In the total stand of softwood cordwood the Official territory ranks third (9 percent in Grouping A and 6 percent in Grouping B). The Western Trunk Line territory is second in the

Source: Based on Table 82.

[fol. 5746] stand of hardwood cordwood on cordwood and restocking areas, but in the total stand of hardwood cordwood it is third in Grouping B and fourth in Grouping A. It is fourth in the total stand of softwood cordwood in Grouping B and fifth in Grouping A. Southwestern territory ranks fourth in the total stand of softwood cordwood, in Grouping A and fifth in Grouping B. It is third in the total stand of hardwood cordwood in Grouping A and fourth in Grouping B.

Ranking of Freight Rate Territories in Forest Areas and Stands of Timber

For the sake of convenience the ranking of each of the five freight rate territories (in Grouping A and Grouping B) according to their importance in forest areas and stand of timber by character of growth, is presented in Table 83. The territories are ranked from 1 to 5 in order of their importance in each category of forest area and stand of timber.

The Mountain-Pacific territory ranks first in Groupings A and B in the following:

Area of old-growth saw timber.
Total area of saw timber.
Stand of old-growth softwood saw timber.
Stand of second-growth softwood saw timber.
Total stand of softwood saw timber.
Total stand of old-growth saw timber.
Total stand of saw timber.
Stand of soft cordwood on saw-timber area.
Total stand of cordwood on saw-timber area.
Stand of soft cordwood on cordwood area.
Total stand of cordwood on cordwood area.
Stand of soft cordwood on all areas.
Total stand of cordwood on all areas.
Total stand of all softwood timber.
Total stand of all timber.

The Southern territory is first in:

	in Grouping
Area of second-growth saw timber	A and B
Cordwood area	A and B
Fair to satisfactory restocking area	B
[fol. 5747] Total restocking area	B

	In Grouping
Total forest area	A and B
Stand of old-growth hardwood saw timber	A and B
Stand of second-growth hardwood saw timber	B
Total stand of hardwood saw timber	A and B
Total stand of second-growth saw timber	A and B
Stand of hard cordwood on saw timber area	A and B
Stand of hard cordwood on all areas	B
Total stand of all hardwood timber	B

The Official territory leads in:

	In Grouping
Fair to satisfactory restocking area	A
Poor to non-restocking area	A
Total restocking area	A
Stand of second-growth hardwood saw timber	A
Stand of hard cordwood on cordwood area	A and B
Stand of soft cordwood on restocking area	A and B
Stand of hard cordwood on restocking area	A and B
Total stand of cordwood on restocking area	A and B
Stand of hard cordwood on all areas	A
Total stand of all hardwood timber	A

The Western Trunk Line territory is first in "poor to non-restocking area" in Grouping B. The Southwestern territory does not lead in any of the classifications of forest area or stand of timber. (See Table 83).

The ranking of freight rate territories in the total forest area and in the total stands of softwoods and hardwoods indicates that the Southern territory is first in the total forest area (128 million acres in Grouping A and 158 million acres in Grouping B, or about one-third of the total commercial forest area in the United States). This terri-

(Here follows 1 Photolithograph, side folio 5748)

Total stand of all timber	3	3	2	2	5	4	4	5	1	1

1/ As measured in board feet.
2/ As measured in cords.
3/ As measured in cubic feet.

Source: Based on Tables 78-82.

[fol. 5749] tory also leads in the total stand of hardwoods in Grouping B (58 billion cubic feet, or two-fifths of the U. S. total stand of hardwoods), but in Grouping A it occupies second place (43 billion cubic feet, or about one-third of the U. S. total stand of hardwoods). The Southern territory ranks second in total stand of softwoods in both groupings (42 billion cubic feet in Grouping A and 50 billion cubic feet in Grouping B, or over one-tenth of the total stand of softwoods).

The Mountain-Pacific territory is second in total forest area (117 million acres in both groupings, or about one-fourth of the total forest area). This territory is outstanding in the total stand of softwoods (291 billion cubic feet in both groupings) and its softwood stand is so large (over three-fourths of the U. S. total stand of softwoods) that its combined stand of softwoods and hardwoods (295 billion cubic feet) constitutes over one-half of the total stand of timber on (commercial) forest land in the United States. Mountain-Pacific territory, to be noted, has the lowest ranking in the total stand of hardwoods. It has only slightly over 3 billion cubic feet of all hardwoods.

Official territory leads in the total stand of hardwoods in Grouping A (58 billion cubic feet) but it is second in this stand in Grouping B (45 billion cubic feet). This territory is third in the total stand of softwoods in both groupings (21 billion cubic feet and 13 billion cubic feet in Grouping A and Grouping B, respectively). It ranks also third in the total forest area in both groupings (112 million acres in Grouping A and 80 million acres in Grouping B).

Western Trunk Line territory ranks fourth in the total forest area (53 million acres in Grouping A and 74 million acres in Grouping B). In the total stand of hardwoods it is third in Grouping B (22 billion cubic feet) and fourth in Grouping A (15 billion cubic feet). Western Trunk Line territory has the lowest total stand of softwoods (6 billion cubic feet in Grouping A and 10 billion cubic feet in Grouping B).

Southwestern territory is lowest in the total forest area (52 million acres in Grouping A and 36 million acres in [fol. 5750] Grouping B). This territory is third in the total stand of hardwoods in Grouping A (23 billion cubic feet) and fourth in Grouping B (14 billion cubic feet). The Southwestern territory is also fourth in total stand of softwoods in both groupings (16 billion cubic feet in Grouping A and 11 billion cubic feet in Grouping B).

The ranking of freight rate territories on the basis of the distribution of the total saw-timber area and the total stands of softwood and hardwood saw timber presents a striking coincidence in the order of importance of freight rate territories in the first two items (in the total saw timber area and in the total stand of softwood saw timber) as follows:

Territory	Rank	Total saw timber area		Stand of softwood saw timber	
		Grouping A	Grouping B	Grouping A	Grouping B
		(Million acres)		(Billion bd. ft.)	
Mountain-Pacific	1	77	77	1,213	1,213
Southern	2	58	74	146	174
Official	3	39	30	62	42
Southwestern	4	30	20	56	40
Western Trunk Line	5	9	12	15	24
Total		213	213	1,493	1,493

The ranking of freight rate territories in the total stand of hardwood saw timber indicates that the Southern territory is first (98 billion board feet in Grouping A and 134 billion in Grouping B, or 36 and 50 percent of the U. S. total, respectively), and the Mountain-Pacific territory is lowest (5 billion board feet in both groupings). Official territory is second in the total stand of hardwood saw timber (90 billion board feet in Grouping A and 60 billion board feet in Grouping B). Southwestern territory is third in Grouping A (55 billion board feet) and fourth in Grouping B (22 billion board feet). Western Trunk Line, conversely, is fourth in Grouping A (30 billion board feet) and third in Grouping B (41 billion board feet).

[fol. 5751] The ranking of freight rate territories in the total stand of cordwood on all forest areas shows that Mountain-Pacific territory is the leading territory (887 million cords in both groupings, or over one-third of the total stand of cordwoods on the commercial forest area in the United States). Southern territory is second in Grouping B (655 million cords) and third in Grouping A (508 million cords). Official territory, conversely, is third in Grouping B (468 million cords) and second in Grouping A (622 million cords). Western Trunk Line territory ranks fourth in Grouping B (286 million cords) and fifth in Grouping A (195 million cords). And conversely, Southwestern territory ranks fourth in Grouping A (244 million cords) and fifth in Grouping B (159 million cords).

The ranking of freight rate territories in the stands of soft and hard cordwoods separately on all forest areas indicates that the Mountain-Pacific territory is first in the stand of softwood cordwood (877 million cords) but its stand of hardwood cordwood is insignificant (only 10 million cords). Southern territory ranks second in the stand of softwood cordwood (188 million cords in Grouping A and 228 million cords in Grouping B) and it is first in the stand of hardwood cordwood in Grouping B (426 million cords). Official territory is third in the stand of softwood cordwood (122 million cords in Grouping A and 75 million cords in Grouping B) and first in the stand of hardwood cordwood in Grouping A (500 million cords). Western Trunk Line territory ranks fourth in the stand of softwood cordwood in Grouping B and fifth in Grouping A. It is third in the stand of hardwood cordwood in Grouping B and fourth in Grouping A. The Southwestern territory has reverse rankings in the stands of both kinds of cordwood (in Groupings A and B) as compared with the rankings of the Western Trunk Line territory (for figures see Tables 82A and 83).

Stand of Timber Per Acre of Forest Areas

The above tables (Tables 78-83) show the distribution of commercial forest areas and standing timber, by character [fol. 5752] of growth and by territories, and the ranking of territories in forest areas and stand of timber. These tables, however, do not show the relative significance of territories on the basis of their forest density (stand of timber per acre of forest areas). The measurement of forest resources on the basis of timber stand per acre of forest areas is given in Table 84. The Mountain-Pacific territory leads in the stand of timber per acre in every instance except the stands of cordwood per acre of saw timber area and of all restocking areas. The Mountain-Pacific territory has 16,860 board feet of old-growth saw timber per acre (of old-growth saw-timber area), 10,547 board feet of second-growth saw timber per acre (of second-growth saw timber area), and 15,706 board feet of the total saw timber per acre of the total saw-timber area. It has 15.12 cords of cordwood per acre of cordwood area and 7.58 cords of the total cordwood per acre of the total forest area. This territory also has the highest stand of the total timber per acre of the total forest area, 2,519 cubic feet.

The Western Trunk Line territory ranks second in the stand of old growth saw timber per acre (6,571 board feet in Grouping A and 8,323 board feet in Grouping B) and also in the total stand of saw timber per acre (4,316 board feet in Grouping A and 5,590 board feet in Grouping B). It is also second in the stand per acre of second-growth saw timber in Grouping B (however, in Grouping A it ranks third), and in the stand of cordwood on restocking areas per acre of restocking areas. It leads in the stand of cordwood per acre of the saw timber area. However, the Western Trunk Line territory ranks lowest in the total stand of cordwood per acre of the total forest area, and in the total stand of timber per acre of the total forest area. The high density of the saw timber area of the Western Trunk Line territory is attributed to the high proportion of saw timber concentrated in a relatively small area (Michigan, Wisconsin, and Minnesota) of that territory. The low density of all timber area in the Western Trunk Line territory is due to the fact that saw-timber areas constitute only 16 percent of the total forest area of that territory.

(Here follows Photolithograph, side folio 5753)

Table 84. - Stand of Timber Per Acre of Forest Areas, by Character of Growth and by Freight Rate Territories, 1938

Stand of timber per acre	Territory										United States
	Official		Southern		Western Trunk Line		Southwestern		Mountain-Pacific		
	Grouping		Grouping		Grouping		Grouping		Grouping		
	A	B	A	B	A	B	A	B	A	B

Source: Based on Tables 78-82.

The Southern territory is third in the stand per acre [fol. 5754] of old-growth saw timber (5,494 board feet in Grouping A and 5,461 board feet in Grouping B) and also in the total stand of saw timber per acre (4,137 board feet in Grouping A and 4,141 board feet in Grouping B) of the total saw-timber area. It is also third in the stand per acre of second-growth saw timber in Groupings B (however in Grouping A it ranks second). The Southern territory having the low density of cordwoods, especially of cordwood on cordwood area (only 3.76 cords per acre in Grouping A and 3.84 cords per acre in Grouping B), reduces its density of the total stand on the total forest area to fourth place in order of importance as compared with other territories.

The Official territory ranks lowest in the density of old-growth saw timber and next to the lowest in second-growth saw-timber. However, having the highest density of cordwoods on all restocking areas and next to the highest in cordwoods on all forest area, the Official territory raises its density of the total timber stand on the total forest area to third place in Grouping A and to second place in Grouping B.

The Southwestern territory ranks fifth (lowest) in the density of second-growth saw timber, fourth in the density of old-growth saw timber, and third in the density of cordwood on the total forest area. The Southwestern territory is second in the stand of the total timber per acre of the total forest area in Grouping A and third in Grouping B.

Stand of Saw Timber by Species

The U. S. Forest Service in the presentation of the total stand of saw timber on commercial forest by principal species divides all trees in four groups for the year 1938 (See Tables 85 and 86) as follows:

[fol. 5755]

	Billion board feet	Percent
Eastern softwoods	277	16
Eastern hardwoods	266	15
Western softwoods	1,216	69
Western hardwood	5	
Total	1,764	100

Among the principal species of Eastern softwoods are the following:

	Billion board feet	Percent
Southern yellow pine	196.8	71
Spruce and fir	24.1	9
White and red pine	18.1	7
Hemlock	17.6	6
Others	20.3	7
Total	276.9	100

Eastern hardwoods are comprised from the following principal species:

	Billion board feet	Percent
Oak	83.7	32
Birch, beech and maple	55.2	21
Red gum	27.8	10
Tupelo	20.4	8
Others	78.5	29
Total	265.6	100

Western softwoods are made up of the principal species as listed below:

	Billion board feet	Percent
Douglas fir	489.9	40
Ponderosa pine	224.9	18
True fir	121.7	10
Western hemlock	115.6	10
Others	264.1	22
Total	1,216.2	100

Western hardwoods constitute an insignificant amount, and this stand of saw timber is not classified by species (by the U. S. Forest Service).

(Here follows 2 Photolithographs, side folios 5756-5757)

S. D.A., Forest Service, "Forest Statistics: Area, Stand, Growth and Drain" (prepared for Joint Congressional Committee on Forestry), 1939, Table 3 (processed).

S. Forest Service, "Stand of Saw Timber in the United States, by Character of Growth and by Regions and States /in 1938/." A table prepared for Joint Congressional Committee on Forestry, 1939 (processed).

S. D.A., Forest Service. Unpublished material from the office of R. D. Garver, Director of Forest Survey.

[fol. 5758] Tables 85 and 86 on the distribution of the stand of saw timber (on commercial forest land) by species and by freight rate territories and also other tables (87 and 88) are compiled from the U. S. Forest Service tables by regions and since the Forest Service does not furnish state figures, the Tables 85-88 by freight rate territories have only one grouping of states by territories (for the details of states comprising each territory, see footnotes to Tables 85-88).

The distribution of the stand of saw timber by species (Tables 85 and 86) illustrates that the Southern freight rate territory is leading in eastern softwoods and hardwoods (53 and 37 percent, respectively). Southern yellow pine is the leader in the eastern softwoods of the Southern territory, and it contributes 90 percent to the stand of the softwood saw timber in the Southern territory. Oak contributes 35 percent and red gum 16 percent to the stand of hardwood saw timber in the Southern territory.

The Official territory ranks second in eastern hardwoods (29 percent of the total eastern hardwoods) and third in eastern softwoods (19 percent of the total eastern softwoods). Oak, birch, beech, and maple, spruce and fir, and white and red pine are the principal species in the Official territory (see Tables 85 and 86).

The Southwestern territory is second in eastern softwoods (20 percent of the total eastern softwoods) and third in eastern hardwoods (21 percent of the total of eastern hardwoods). Southern yellow pine and oak are the major trees growing in the Southwestern territory.

The Western Trunk Line territory is the lowest among the three other territories having eastern saw timber. Hemlock, oak, birch, beech, and maple are the major species in the Western Trunk L[illegible]erritory.

The Mountain-Pacific [illegible]itory is an outstanding area in western softwoods. This territory practically includes all western softwoods (99.7 percent). The most important species in the Mountain-Pacific territory are: Douglas fir [fol. 5759] (40 percent of the total western softwoods), ponderosa pine (18 percent), true fir (10 percent), and western hemlock (9.5 percent). Western hardwoods lying in the Mountain-Pacific territory constitute only .28 of one percent of the total stand of saw timber on commercial forest land.

Current Annual Growth

The U. S. Forest Service estimates that the total annual growth (in 1936) on commercial forest land is equal to 11.3 billion cubic feet (combined saw timber and cordwood growth). Of this volume, 5.9 billion cubic feet is softwood growth, and 5.4 billion cubic feet is hardwood growth (see Table 87). The Southern territory leads in the total growth (41 percent), softwood growth (42 percent), and hardwood growth (41 percent). The Southern territory is outstanding not only in forest acreage and stand of hardwood saw timber (for the discussion of forest acreage and stand, see preceding sections) but also in "the ease with which forests are renewed * * * [in the South and] their rapid growth."[1]

The Mountain-Pacific territory stands second in the total growth (18 percent) and in softwood growth (33 percent), but it is lowest in hardwood growth (1 percent). The Southwestern territory is third in the total softwood and hardwood growths. The Official territory ranks fourth in the total growth and softwood growth, but it is second in the hardwood growth (28 percent). The Western Trunk Line territory is rated lowest in the total growth and softwood growth but it outranks the Mountain-Pacific territory in hardwood growth.

The total saw timber growth on commercial forest lands for 1938 is 32 billion board feet, of which amount 21.2 billion board feet is softwood saw timber growth and 10.8 billion

1/ Growth figures represent volume of wood without bark, as in estimates of forest drain. Board-foot volumes are on the basis of estimated lumber tally, assuming utilization consistent with good practice in each region. The growth in cubic feet is for stem wood, including all trees 4 inches or more in diameter breast height; it includes the limbs in the hardwoods.

2/ Excluding Mich., Wisc., Va. and W. Va.; including Iowa and Missouri.

3/ Including Virginia and West Virginia; excluding Louisiana (except the extreme northeastern corner of Louisiana) and southeastern portion of Mississippi (along Mississippi River).

4/ Including Mich. and Wisc.; excluding Iowa, Mo. and southwestern portion of S. Dak.; negligible amounts for N. Dak., Nebr., Kans., and for remaining portion of S. Dak. not reported.

5/ Including La. (except an extreme northeastern corner of La.) and southwestern portion of Miss. (along Miss. River); negligible amounts for eastern portions of Oklahoma and Texas not reported.

6/ Including Colorado and southwestern portion of South Dakota.

7/ The effective growth is estimated at 9.6 billion cubic feet, including 27.5 billion board feet of sawtimber.

Source: U. S. Forest Service, "Forest Statistics: Area, Stand, Growth, and Drain" (prepared for Joint Congressional Committee on Forestry), 1939. Table 11 (processed).

[fol. 5761] board feet is hardwood growth. Freight rate territories have precisely the same ranking in saw timber growths as in combined saw timber and cordwood growths (for percentages, see Table 87).

Current Annual Growth and Drain

The latest data on the total annual growth and drain (from logging and destructive agencies) of standing total timber on commercial forest land (for 1936) show that the drain is 13.5 billion cubic feet (combined saw timber and cordwood) and the growth is 11.3 billion cubic feet (see Table 88). The ratio of drain to growth for these data is 1.2. The Mountain-Pacific territory has the highest ratio (1.8) and the Southwestern territory has the lowest ratio (0.9). The ratio for the Official territory is 1.2, for Southern territory is 1.1, and the ratio for the Western Trunk Line is 1.

The annual saw timber growth on commercial forest land (for 1936) is 32 billion board feet and the annual drain (for the same year) is 47.8 billion board feet. The ratio of drain to growth for these data is 1.5. The Mountain-Pacific territory has the highest ratio of this kind (2.8) and Southwestern territory has the lowest ratio (1.1). The Official and Southern territories have the ratio 1.2, and the Western Trunk Line territory has the ratio 1.3.

Messrs. Marsh and Gibbons of the United States Forest Service, referring to the relation of current growth to drain, remark:

> "Although current growth approaches current drain more closely than it has since man began extensive use, the situation is actualy less favorable than the growth-drain comparisons * * * indicate. Not all of the growth is effective. Cutting, for the most part, takes the better trees, while most of the growth is in inferior species or small, low-quality tres. Much of the drain is concentrated locally, and forest industries continue to cut out and close down * * *

2/ Including Virginia and West Virginia; excluding Louisiana (except the extreme northeastern corner of Louisiana) and southeastern portion of Mississippi (along Mississippi River).

3/ Including Michigan and Wisconsin; excluding Iowa, Missouri, and southwestern portion of South Dakota; negligible amounts for North Dakota, Nebraska, Kansas and for remaining portion of South Dakota not reported.

4/ Including La. (except the extreme northeastern corner of La.) and southwestern portion of Mississippi (along Mississippi River); negligible amounts for eastern portions of Okla. and Texas not reported.

5/ Including Colorado and southwestern portion of South Dakota.

Source: U. S. Forest Service, "Forest Statistics: Area, Stand, Growth, and Drain" (prepared for Joint Congressional Committee on Forestry), 1939, Table [12] (processed).

[fol. 5763] "The high ratios of drain to growth in the West are less significant than they would otherwise be because of the large quantities of virgin timber which permit a certain excess of cutting. It appears, however, that the present stand of economically available timber is less than the regulated growing stock necessary to sustain the current rate of saw-timber utilization.

"The saw-timber stands in the East have only about two-thirds of the volume needed to sustain the current annual saw-timber drain. * * *"[1]

Future Timber Requirements

In connection with the future timber requirements, the same authorities state:

> "No one can say with assurance just how much wood we shall use at any future time—even within the next decade, not to mention 50 or 100 years hence. Equally indeterminate is the amount of timber that we shall supply to other countries. Yet a sound program of forestry must aim to anticipate future domestic requirements and foreign demands with some degree of probability.
>
> "Among the factors that will influence the amount of timber we can consume or dispose of is the timber supply itself. An abundance of timber of the desired character and quality, available at low cost, would make for larger consumption; competition from other materials would be reduced, as wood would tend to replace more costly and less accessible materials. On the other hand, scarcity, poor quality and high prices would make for less consumption. This is one reason why utiliza-[fol. 5764] tion of the great quantity of inferior materials now present in our forests constitutes a serious problem.
>
> "Another important factor is the ability of people to purchase. For example, bringing the average quality of the buildings on the 3 million farms in the South to a decent level will depend in large measure on the ability of the farmers to purchase lumber. Higher

---

[1] Marsh and Gibbons, supra, p. 481.

standards of living and greater prosperity would unquestionably make for greater consumption of timber.

"There are also great possibilities for developing new uses and products, particularly through chemical processes. Although wood is by no means a stranger in the chemical-utilization field, it is still largely used, except for shaping by manufacture, in substantially the form in which nature produces it. But even so, many of our present uses of wood have developed during this century. Equally revolutionary changes in wood utilization may be expected in the future, with resultant increase in consumption, although certain present uses may decline."[1]

[fol. 5765]

Chapter VI

Rate Territory Distribution of Human Resources

Total and Gainfully Employed Poupulation

No consideration of the distribution of the resources of the various freight rate territories can possibly be regarded as complete without some discussion of those resources represented by the population for whose benefit all other natural resources are utilized and whose well-being is so largely dependent thereon. As the National Resources Board remarks,

> "Finally, human resources and human values are more significant than the land, water, and minerals on which men are dependent. The application of engineering and technological knowledge to the reorganization of the natural resources of the Nation is not an end in itself, but is to be conceived as a means of progressively decreasing the burdens imposed upon labor, raising the standard or living, and enhancing the well-being of the masses of the people."[1]

Table 89 shows for 1930 the total population of the United States and the total population ten years of age and over gainfully employed, each being distributed according to the A and B state groupings heretofore employed for the five freight rate terrtories. In both groupings Official classification territory contained slightly over 50 percent of the population of ten years of age and over gainfully employed. The same is true of the total population in the A grouping but by the B grouping this area shows just under 50 percent of the total. Southern territory ranks second with between 15 and 19 percent of both the total population and the population of ten years of age and over gain-

[fol. 5767] fully employed. Western Trunk Line ranks slightly below Southern territory in its proportion of both totals, followed by the Mountain-Pacific and Southwestern areas in the order named.

The relative importance of the different kinds and classes of employment within these freight rate territories shows very substantial variations. On the other hand, though there are some differences in the proportions of the population gainfully employed and the total population in each of these areas, these differences do not appear to be either striking or significant. Throughout the discussion, therefore, the figures for the different subgroups and subclasses of gainfully employed persons in the different territories have been compared only with the total gainfully employed within such areas and not with the total populations living therein.

Major Occupations

Table 90 presents the distribution of the total population gainfully employed for the major Census classifications of occupations acording to freight rate territories. Except for agriculture and forestry and fishing, Official territory shows a higher proportion of persons living within its boundaries in each of the occupations listed than of the total gainfully employed. On the other hand, much higher proportions of persons engaged in agriculture and in forestry and fishing are found in the South than of the total gainfully employed and lower proportions of the other activities excepting only domestic and personal service. Western Trunk Line and Southwestern territories show, of course, much higher proportions of the United States totals engaged in agriculture than of the total gainfully employed in those territories. The reverse is true of the Mountain and Pacific area. This last area also employs a strikingly higher proportion of the total persons in fishing and forestry (approximately 30 percent) as compared with the total of gainfully employed in the country (from 9 to 10 percent). It is perhaps worth noting as bearing upon the diversification of industry however, that Official territory showed a larger proportion of persons engaged in agriculture than any other area except Southern territory and, on

[fol. 5769] the basis of the A grouping, a larger proportion of the total engaged in forestry and fishing than any other area. On the basis of the B grouping, it was between 3 and 4 points percent below both the Southern and Mountain-Pacific areas in the latter occupational grouping.

For the remaining occupations Western Trunk Line territory shows slightly higher or slightly lower proportions of persons than of the total gainfully employed. Except for the extraction of minerals, where its proportions of the United States total (5.73 percent in the A and 7.51 percent in the B grouping) are greatly below those of the total gainfully employed (12.66 and 13.49 percent by the A and B groupings respectively) the differences are scarcely large enough to warrant any comment.

Owing to its high proportion of the total persons gainfully employed in agriculture, the other occupations in Southwestern territory most frequently employ lower proportions of the United States totals for these occupations than of the total of the country's gainfully employed as a whole. Qualifications of this generalization are found in the forestry and fishing and in the domestic and personal services occupations in the A grouping and in the extraction of minerals in the B grouping. Despite its high degree of employment in forestry and fishing, Mountain-Pacific territory shows higher proportions of employment in most of the other occupations by one or the other of the groupings than its proportion of the total gainfully employed. Qualifications are agriculture and the manufacturing and mechanical industries in both groupings.

Social-Economic Groupings

In one of its special studies the Bureau of the Census has rearranged the occupational figures for the 1930 Census into so-called social-economic groupings [1] and these regroup- [fol. 5770] ings of the Census figures have been utilized in this section for analyzing the more important occupational differences between the rate territories.

This census study subdivides the gainful workers into the following major classes: (1) professional persons, (2) proprietors, managers, and officials, (3) clerks and kindred workers, (4) skilled workers and foremen, (5) semi-skilled workers, and (6) unskilled workers. Tables 91 and 92 distribute the total gainfully employed population of 10 years of age and over in each of the freight rate territories according to these major groupings. In 1930 the proportions of (1) clerks and kindred workers, (2) skilled workers and foremen, and (3) semi-skilled workers in Official territory were very much greater than the proportion of the total population of the country which was gainfully employed within this area. In excess of 60 percent of the total number of persons in the United States in each of these three occupations were located in Official classification territory as compared with slightly over 50 percent of the total gainfully employed in the United States living within that area. Of professional persons, the proportion living in Official classification territory is substantially below the proportion of each of the three above mentioned classes though somewhat above the proportion of the total gainfully employed. In the case of the proprietor, manager, and official and the unskilled worker group, on the other hand, Official territory's proportion of the United States total is appreciably lower than its proportion of the total gainfully employed in the United States.

---

[1] Alba M. Edwards, statistician for occupations, A Social-Economic Grouping of the Gainful Workers of the United States, Bureau of the Census, 1938.

Approximately the reverse of this situation is found in both the Southern and Southwestern territories. The proportion of the total of proprietors, managers, and officials and of unskilled labor living in each of these territories is higher than the corresponding proportions of the total population gainfully employed in these areas, whereas the proportions of the clerical and kindred worker, skilled worker and foremen, and semi-skilled worker groups are lower. Also in these territories the proportion of professional persons is lower than is the proportion of all gainfully employed living in the area, again in contrast with the situation in Official territory.

Source: U.S. Department of Commerce, Bureau of the Census, A Social-Economic Grouping of the Gainful Workers of the United States, 1930, pp. 46-49; except for last column (Gainfully occupied) from U.S. Dept. of Commerce, Bureau of the Census, Abstract of the Fifteenth Census of the United States, 1930, pp. 321-322.

[fol. 5773] On the basis of both the A and B groupings, Western Trunk Line territory shows higher proportions of professional persons and proprietors, managers and officials than of the total gainfully employed but lower proportions for the remaining four of the six classes.

Mountain-Pacific territory shows higher proportions of professional persons, clerks and kindred workers, and skilled workers and foremen than of its total gainfully employed regardless of which groupings is involved. For the remaining classes, the proportion is lower but in nearly all the six groupings the proportion of persons in the major classes of employment within this area vary only narrowly from the proportion of the total gainfully employed.

Professional Persons

The greatest discrepancies in the distribution of professional persons as compared with the distribution of the total gainfully employed occur in Official and Southern territories. The former area shows about 3 points percent higher proportion of professional persons than of the gainfully employed population and the latter area from 5 to 7 points percent less than the proportion of the gainfully employed population depending on the grouping used. The proportion of professional persons of Western Trunk Line territory coincides closely with the proportion of the gainfully employed population living in this area, the difference being less than 1 point percent in either of the comparisons. Although, as indicated previously, Southwestern territory is like Southern territory in that its proportion of professional people is less than its proportion gainfully employed, the discrepancy is less than in Southern territory. Similarly, although Mountain-Pacific territory resembles Official territory in showing higher proportions of professional people than of the total gainfully employed, the excess is somewhat less than that of Official territory by about 1 point percent. Largely because of the rather close correspondence of the distribution of professional persons with the total gainfully employed, no distribution of this group by particular professions has been made. It is also true that a number of the large classes in this [fol. 5774] group are significant primarily from a social rather than from an economic point of view. For example, of the total of a little less than 3 million professional persons, over 1 million are teachers, nearly 300,000 are trained nurses, nearly 150,000, clergymen, and over 150,000 lawyers, judges and justices.[1]

Proprietors, Managers, and Officials

Tables 93 and 94 present a distribution of the principal classes of proprietors, managers and officials according to the Census groupings, the principal classes being selected on the basis of the fact that the occupations shown included not less than 150,000 persons in 1930, excluding restaurant, cafe and lunchroom keepers. Farm owners and tenants far outrank any other major grouping in the proprietor, manager and official occupational classification both in total and in almost every freight rate territory. Except in the Mountain-Pacific division and in Grouping A of the Southwestern territory there are more than one million farmers in each of the four freight rate territories. In all territories combined farmers aggregated 6,012,012 persons out of a total of 9,665,540 classified as proprietors, managers and officials by the Census study or 62.2 percent of the total.

The fact that the Southern, Western Trunk Line, and Southwestern rate territories show substantially higher proportions of proprietors, managers, and officials than of the total gainfully employed in these areas is accounted for primarily by the importance of the farmers included in the former category.

In these three territories the overwhelming proportion of the proprietor, manager and official group are engaged in agriculture either as farm owners or tenants. Southern rate territory includes an appreciably higher proportion of the total farm owners and tenants of the United States than does any other rate area, slightly less than one-third by the A grouping and slightly over one-third by the B grouping. Official territory ranks second among the rate territories in the number and proportion of the total farmers

Source: U.S. Department of Commerce, Bureau of the Census, Fifteenth Census of the United States: 1930, Population, Vol. IV, Occupations, by States, U.S. summary, Table 3; individual states, Table 4; except for last column (Gainfully occupied) from U.S. Dept. of Commerce, Bureau of the Census, Abstract of the Fifteenth Census of the United States, 1930, pp. 321-322; and next to last column (All proprietors) from U.S. Dept. of Commerce, Bureau of the Census, A Social-Economic Grouping of the Gainful Workers of the United States, 1930, pp. 46-49.

[fol. 5777] of the United States included within its boundaries on the basis of the A grouping though it is third or slightly below Western Trunk Line territory in the B grouping. Although its proportion of the total farm owners and tenants of the United States is a little less than one-half of its proportion of the total gainfully employed, Official territory nonetheless ranks very much above either the Southwestern or the Mountain-Pacific areas in its number of farmers and is even with the great Western Trunk Line agricultural area in this respect. (See also Chapter IV)

In the occupational subclasses of the proprietor, manager and official group other than farmers, Official territory includes much higher proportions of the United States totals for these occupations than any other rate area; also substantially higher proportions of each of these classes than of the total gainfully employed in this rate territory. Except for the Mountain-Pacific division, the reverse tends to be true of the other territories largely as a result of the relatively heavier weighting of the proprietor, manager, and official group as a whole by farmers in the Southern, Western Trunk Line, and Southwestern areas as compared with either Official or Mountain-Pacific territory. The two latter show a much lower proportion of farmers than of proprietors, managers and officials as a whole and higher proportions of the other subclasses except for manufacturing managers and officials in the case of Mountain-Pacific territory.

Farm Owners and Tenants.

The heavy weighting of the proprietor, manager and official group by farmers as well as the importance of this relatively homogeneous agricultural group in the total gainfully employed figures appears to justify a further analysis of the composition of this occupation. This is shown in Tables 95 and 96.

According to these tables a larger number and proportion of all full owners of farms are located in Official classification territory than in any other of the four rate territories. Not only is this true but this territory is exceeded

[fol. 5780] in the number and proportion of partial farm owners only by Western Trunk Line territory. In contrast, Southern territory is equally outstanding in showing a larger number and proportion of cash tenants and croppers than any other rate territory and is exceeded by Southwestern territory in the proportion of "other" tenant farmers by only 1 point percent in the B grouping. About one-quarter of the cash and of "other" tenants are found in Western Trunk Line territory and nearly one-quarter of the "other" tenants in the Southwestern area. Southwestern territory accounts for nearly all the croppers not found in Southern territory. The Bureau of the Census does not publish figures for croppers outside of the Southern States.

In Table 97 the full and part owners of farms have been combined in a single group and all three classes of tenants in another group. From this table it appears that a larger number and proportion (between 29 and 33 percent depending on the grouping used) of full and partial farm owners in the United States were located in Official territory than in any other rate area. Between 21 and 27 percent of these owners, depending on the grouping used, are found in Southern, and between 22 and 24 per cent in Western Trunk Line territory. The remainder, representing roughly from 19 to 22 percent, depending on the grouping used, are rather evenly divided between the Southwestern and the Mountain-Pacific territories. In three of the five territories, Official, Western Trunk Line, and Mountain-Pacific, the number and proportion of farm owners appreciably exceeds the number of tenants while the reverse is characteristic of Southern and Southwestern territories. Between 38 and 44 percent (depending on the grouping used) of the more than 2.5 million tenants were found in the Southern area as against a trifle over 12 percent located in Official territory. This proportion of tenant farmers in Official territory, it will be noted, is much below that of any other rate area except the Mountain-Pacific division which shows the lowest proportion of tenants. In this latter area tenant farmers represent between 20 and 21 percent of the total farm owners and tenants. In Official territory, on the other hand, with something like three times as many farm owners and tenants as the Mountain-Pacific division, the proportion of tenants to the total farmers in the former area is only slightly higher than in the latter.

[fol.5782] *Skilled Workers and Foremen*

Table 98 distributes by rate territories the skilled workers in each of the different skills, as classified by the Census study referred to, in which over 100,000 people were gainfully employed in 1929, excluding only foremen, policemen and locomotive engineers. Although Official classification territory included in 1929 only 51 to 53 percent of the population gainfully employed, depending upon whether the A or B grouping is used, the proportion of skilled workers in this territory was consistently higher than its proportion of the total gainfully employed for each of the 12 skills tabulated. This is the only one of the five freight rate territories of which this statement can be made. Southern territory with almost equal consistency showed a substantially lower proportion of each of these skills than its percentage of the total gainfully employed. In about nine of the occupations this area included over 60 percent of the United States total and for half of the twelve, the proportions are from two-thirds to three-quarters or more of the United States total. In the Mountain-Pacific division the proportion of people gainfully employed in these twelve skills is less than the proportion of the area's gainfully employed in a majority of cases. In the other two rate territories the proportion of the United States total employed in some skills exceeded the territories' proportion of the total gainfully employed but the number of skills for which this is true is less than in the Mountain-Pacific division, thus placing them in an intermediate position between that territory and the Southern rate area.

Semi-Skilled and Unskilled Workers

The total number of semi-skilled workers so classified by the Census analysis is just under 8 million (7,977,572) of which number about 4 million or just over 50 percent are classed as manufacturing operatives. A little under another million persons (972,418) are employed as chauffe-rs and truck and tractor drivers, more than a third of a million (374,290) as barbers, hairdressers and manicurists, and little over one-quarter of a million as housekeepers and stewards. These groups together, therefore, account for more than 70 percent of the total semi-skilled labor, the remaining 30 percent being distributed in some 35 occupa-

Source: U. S. Department of Commerce, Bureau of the Census, Fifteenth Census of the United States: 1930, Population, Vol. IV, Occupations, by States, U.S. summary, Table 3; individual states, Table 4, except for last column (Gainfully occupied) from U.S. Dept. of Commerce, Bureau of the Census, Abstract of the Fifteenth Census of the United States, 1930, pp. 321-322; and next to last column (Total skilled workers) from U. S. Dept. of Commerce, Bureau of the Census, A Social-Economic Grouping of the Gainful Workers of the United States, 1930, pp. 46-49.

[fol. 5784] tions no one of which accounts for as many as 200,000 persons, and the great majority of which represent a livelihood for less than 100,000 persons. Because the character of these occupations as well as the comparatively small number employed in these subclasses the semi-skilled workers have not been distributed by freight rate territories excepting only manufacturing operatives.

The total number of unskilled workers as distributed by the Census analysis is 14,008,869. Of these workers farm laborers, laborers in manufacturing, "not otherwise specified" mine operatives (coal and other) and the servant classes (cooks and other servants) account for the occupations of a little over 10.5 million or roughly 75 percent of the total. The distribution of these classes of workers, together with that of the semi-skilled manufacturing operatives, is shown in Table 99 according to freight rate territories.

Considering the high centralization of manufacturing operations in Official territory, it is not surprising to find that from 72 to 74 percent of the manufacturing operatives in the United States live in Official classification territory, or roughly 20 points percent more than the proportion of the total gainfully employed within this area. The South ranks second in importance in manufacturing operatives with the Western Trunk Line, Mountain-Pacific, and Southwestern territories following in the order named.

As bearing upon the importance of agriculture within these territories, it is of interest to note that in its number and proportion of the total farm laborers Official territory is second only to Southern territory. In terms of wage workers, however, there were more farm laborers in Official territory than in any other freight rate territory upon the basis of the A grouping of states though Southern territory leads on the basis of the B grouping. The South, however, shows more than half of all the unpaid family workers whereas Official territory is lower than any other area except Mountain-Pacific in this respect though not greatly below Western Trunk Line.

In unskilled labor in manufacturing, Official classification territory shows a very much lower proportion of the United States total than it does of semi-skilled labor represented by manufacturing operatives, less than 60 percent

(Here follows 1 Photolithograph, side folio 5781)

Source: U.S. Department of Commerce, Bureau of the Census, Fifteenth Census of the U.S.: 1930, Population, Vol. IV, Occupations, by States: U.S. summary, Table 3; individual states, Table 4. Last column (Gainfully occupied) U.S. Dept. of Commerce, Bureau of the Census, Abstract of the Fifteenth Census of the U.S., 1930, pp. 321-2. Column Total Unskilled Labor - U.S. Dept. of Commerce, Bureau of the Census, A Social-Economic Grouping of the Gainful Workers of the United States, 1930, pp. 46-49.

[fol. 5786] of the former being located in this area as compared with above 72 percent for the latter. Both the number and percentage of unskilled factory laborers in each of the other four areas appreciably exceeds the number and percentage of semi-skilled manufacturing operatives.

This situation should be considered in the light of the figures presented above showing that the proportions of skilled workers in 12 leading occupations exceeded the proportions of the total gainfully employed in Official classification territory and the complete or partial reverse of this situation in the other four territories. (Table 98.)

The mine operative figure is heavily weighted by coal miners who in the 1930 census were more than twice as numerous as other mine operatives. This no doubt accounts in part for the fact that the largest numbers and proportions of miners are found in Official classification territory. Southern or Mountain-Pacific territory is second depending upon which grouping is used. In Official territory the proportions of miners are substantially higher than are the proportions of the total gainfully employed. The same is also true for the Mountain-Pacific division. The reverse of this is true of the other three divisions with a qualification for Southwestern territory in the B grouping of States.

The servant class, as is perhaps to be expected, is distributed between the freight rate territories in proportions rather closely approximating the distribution of the total gainfully employed. In both Official and Southern territories the proportion of the servant class is slightly higher than the proportion of the gainfully employed whereas it is slightly lower in the other three freight rate territories. The differences in the distribution of servants and total gainfully employed appears to be too narrow to be of any great significance.

COST SCALES

Cost scales by territories and classes of equipment (bound separately).

The analysis and research necessary to this study were made by the members of the Cost Section and E. S. Hobbs, Statistical Analyst. The application of the cost formula to the carriers' accounting and statistical data was made under the direction of John W. Kreps, Chief, Annual Reports Section.

CHAPTER I

Levels of Costs and Their Economic Significance

Purpose of the study:

The purpose of this study 1/ is to provide territorial cost data that may be used in determining the relative transportation costs in the respective rate territories, and that may be of aid in the development of territorial class rate scales.

Brief description of the cost scales:

The scales of costs shown for each territory are based upon the average operating conditions in each territory. The costs, therefore, represent a weighted average of all conditions, i.e., main line and branch line operation, through train and way train operation, operation on lines of heavy traffic density and lines of light traffic density, and the operation of large terminals and small terminals.

Distribution of costs on a use basis:

The distribution of the expenses herein has been based on the relative use that the carload and less-carload traffic of varying net loads makes of the transportation facilities of the carrier.

The cost study does not reflect those factors which occasion differences in rates which cannot be justified under a strict adherence to a cost of service principle. Such factors include the value of the service, ability to pay, value of the commodity, competitive relationships, degree of manufacture, etc. Because of these factors some rates may be above the costs indicated and other rates may be below such costs, but on the average all traffic must earn the amounts shown if the carriers' revenues as a whole are to cover the elements of cost listed.

The expansion of the carload expenses for less-carload and passenger deficits 2/ results in the distribution of such deficits

---

1/ This study consists of two parts, bound separately. The first contains the explanatory text. The second contains the cost scales.

2/ By "deficit" is meant the amount by which the revenues from the less-carload and passenger services fail to cover the costs assigned and apportioned to these services.

over each carload movement in proportion to the use each movement makes of the carrier's transportation facilities. As in the distribution of the expenses, no recognition is here given to the differences between commodities in their ability to pay.

All data are based on the experience of the year 1939. Conclusions concerning less-carload and passenger deficits are also based on the experience for this year.

Levels of cost:

The concept of cost embraces many considerations depending upon the use for which the data are intended. No one single figure can satisfy all situations. For this reason the present study develops the following significant levels of cost:

I. Carload and less-carload out-of-pocket costs. 1/

II. Carload and less-carload freight operating expenses, rents and taxes.

III(a). Carload and less-carload operating expenses, rents and taxes, plus an allowance for a return at 4 percent, upon the carload and less-carload portions of the value of the property.

III(b). Carload and less-carload operating expenses, rents and taxes, plus an allowance for a return at 5¾ percent upon the carload and less-carload portions of the value of the property.

IV. Carload operating expenses, rents and taxes, plus less-carload and passenger operating deficits, but excluding return.

V(a). Carload operating expenses, rents and taxes, plus less-carload and passenger operating deficits and a return at 4 percent upon the total value of the property, including the less-carload and passenger portions.

V(b). Carload operating expenses, rents and taxes, plus less-carload and passenger operating deficits, and a return at 5¾ percent upon the total value of the property, including the less-carload and passenger portions.

Levels of cost and their economic significance:

The respective levels of cost developed in this study indicate the average revenue which each 100 pounds of freight would

---

1/ See Chapter V for the treatment of out-of-pocket costs.

have had to earn during the period studied (considering the length of haul, net weight of load, percent of empty return of the equipment, and the tare weight of the equipment) to cover the elements of cost indicated. The nature of the commodity carried receives consideration in these scales only through the variation in load per car, and type of car used. Loss and damage receives separate consideration apart from the scales.

As already indicated, the distribution of the expense is based upon the relative use each movement makes of the carrier's transportation facilities. However, while costs distributed on a "use" basis serve to indicate what each service, carload, less-carload and passenger ought to pay from the cost of service standpoint, the fact cannot be overlooked that these services do not contribute on this basis to the joint costs; i.e., those expenses common to all the services. If some service pays less, others must pay more. In computing carload freight costs, it is economically correct to exclude from such costs these common expenses (such as maintenance of way, general overheads and taxes) which are chargeable to the less-carload and passenger services on a "use" basis. The accounting procedure and the formula used herein accomplish this result. At the same time, it is economically incorrect in computing the revenue needs for carload traffic to ignore the fact that the less-carload and passenger services during the period of study failed to earn enough to cover the full amount of those common expenses apportioned to such services. The study provides for such consideration through its treatment of the less-carload and passenger deficits, but in so doing it gives recognition to the "value of service" or "ability to pay" of these services and the result constitutes a departure from the "use" basis of cost finding. (See Cost Levels IV and V) However, rate making, like all forms of price fixing, is in part an economic problem and not merely an engineering or accounting problem, and by the method of presentation here employed, it is possible for the reader to choose the combination of cost items considered most appropriate for his problem.

Criticism may be leveled at the continued use of the word "cost" under the wider interpretation here given to this term. The term "level of revenue needs" would probably be more proper when referring to levels IV and V. For simplicity of reference, however, the term "cost level" is applied uniformly to all figures.

The economic significance of each of the levels of cost (or levels of revenue needs) is set forth below.

Level I. Carload and less-carload out-of-pocket costs:

This level of cost indicates that average revenue which each 100 pounds of freight would have had to earn to cover the out-of-pocket costs.

The out-of-pocket costs are those added expenses which are occasioned by the existence of any given traffic, or those expenses which would be eliminated by the loss of such traffic. This level of cost represents the minimum below which rates cannot fall without the carrier suffering a loss. At this level of cost it is a matter of indifference 1/ whether or not the carrier handles the traffic, since the revenues received merely equal the added costs incurred. See Chapter V for an explanation of the procedure used in obtaining out-of-pocket costs, and the assumptions upon which such costs are based.

Level II. Carload and less-carload freight operating expenses, rents and taxes:

This level of cost indicates that average revenue which each 100 pounds of freight would have had to earn to cover the operating expenses, rents and taxes assigned and apportioned to the traffic on the basis of the relative "use" which it made of the carrier's transportation facilities. If the revenues from the less-carload and passenger services fail to equal the expenses assigned and apportioned to these services (as was true in 1939 for all territories), this level of cost is of limited significance for purposes of making rates on carload traffic. Under such circumstances Cost Level II represents something above out-of-pocket costs but something below that level of the carload rates necessary to provide for the carrier's subsistence, i.e., permit it to meet its total current operating expenses, rents and taxes exclusive of any allowance for a return or profit. Furthermore, under such conditions, the carload freight service would not be economically self-supporting regardless of whether the less-carload and passenger services continued in existence or were abandoned. 2/

Level III(a) and III(b). Carload and less-carload operating expenses, rents and taxes, plus an allowance for a return at 4 and 5¾ percent respectively, upon the carload and less-carload portions of the value of the property:

This level indicates that average revenue which each 100 pounds of carload or less-carload freight would have had to earn to cover the operating expenses, rents, and taxes, assigned and apportioned

---

1/ Apart from the matter of thereby attracting other more profitable tonnage from the same shipper.

2/ If the revenues from the less-carload or the passenger services fail to equal the out-of-pocket expenses occasioned by the existence of these services, the so-called "subsistence level" of the carload rates could presumably be reduced by abandoning these services and thus saving the amount of the difference between the less-carload and passenger revenues and the less-carload and passenger out-of-pocket costs. The degree to which the revenues from the less-carload and passenger services are covering the out-of-pocket expenses for these services is treated in Chapter III, pages 40-44.

to the traffic on a "use" basis and in addition provide for a return.

This level as applied to carload traffic has economic significance only providing that the less-carload traffic and the passenger traffic are contributing a return on their portion of the value. Inasmuch as this condition does not now obtain, this level of cost has limited economic significance for rate-making purposes.

Level IV. Carload freight operating expenses, rents and taxes, plus less-carload and passenger operating deficits, but excluding return:

This level of cost indicates that average revenue which each 100 pounds of carload freight would have had to earn during the period of study to cover the carload freight service costs, and in addition those expenses assigned and apportioned to the less-carload and passenger services which the revenues from these services were unable to cover. This level of cost, or better stated, level of revenue needs, approximates a bare "subsistence" level of earnings in that under it the carrier's income from all services would equal its total current expenditures for operating expenses, operating rents, and taxes, exclusive of any return on the value of the property used in transportation.

The inclusion of the less-carload and passenger deficits does not throw a burden on the freight service which it is not economically proper for it to bear, providing first, that the revenues from these two services represent in full the ability of these two classes of traffic to pay and secondly providing that such revenues are not less than the out-of-pocket expenses occasioned by the existence of these services.

Level V(a) and V(b). Carload operating expenses, rents and taxes, plus less-carload and passenger operating deficits, and a return at 4 and 5¾ percent, respectively, upon the value of the total property, including the less-carload and passenger portions:

This level indicates that average revenue which each 100 pounds of carload freight would have had to earn if the carrier's revenues from its carload, less-carload and passenger services were to cover the total operating expenses, rents and taxes for these services and in addition earn a return (at 4 or 5¾ percent) upon the total value of the property used by these services.

CHAPTER II

Territories for which Costs Were Developed

Selection and grouping of territories:

The list of territories for which cost data have been developed is based on that given in the Commission's order of January 9, 1940 1/ in Dockets No. 28300, Class Rate Investigation and No. 28310, Consolidated Freight Classification.

Description of territories appearing in Commission's order in Docket 28300, Docket 28310, and MC-C-150 2/, dated January 9, 1940:

The principal territories, as defined in Appendix A to the Commission's order of January 9, 1940, are as follows:

Official territory, including Illinois territory. -- All that part of the United States lying generally east of the following line: Lake Michigan, including west-bank car-ferry ports on official-territory traffic, south to Milwaukee, Wis., thence the line of the Chicago, Milwaukee, St. Paul & Pacific Railway (the Milwaukee) to Rugby Junction, Wis., thence the line of the Minneapolis, St. Paul & Sault Ste. Marie Railway to Duplainville, Wis., thence the line of the Milwaukee, through Watertown to Madison, Wis., thence the line of the Chicago & North Western Railway to Dodgeville, Wis., thence the line of the Illinois Central Railroad to the Illinois State Line and west along the latter to the Mississippi River, thence south along that river, including west-bank crossing points on official-territory traffic, to the Ohio River; and lying generally north of the following line: along the Ohio River east from its mouth, including south-bank crossing points on official-territory traffic, to Cincinnati, Ohio, thence east of the line of the Chesapeake & Ohio Railway to Kenova, W. Va., thence on the main line of the Norfolk & Western Railway to its crossing with the line of the Virginian Railway west of Roanoke, Va., thence on the Virginian Railway to Suffolk, Va., thence on the main line of the Norfolk & Western Railway to Norfolk, Va.

Southern territory. -- All that part of the United States lying south of official territory and east of the Mississippi River, including north-bank Ohio River and west-bank Mississippi River crossing points on southern territory traffic.

1/ This order was subsequently rescinded under date of November 25, 1940.

2/ Docket 28300, Class Rate Investigation, 1939.
Docket 28310, Consolidated Freight Classification,
Docket MC-C-150, Motor Freight Classification.

Southwestern territory. -- Consists of the States of Arkansas, Oklahoma, Texas, and Louisiana west of the Mississippi River, including east-bank crossing points on the Mississippi River in Tennessee, Mississippi, and Louisiana on southwestern-territory traffic.

Western trunk-line territory, including zone C in Wisconsin and southern Missouri. — All that part of the United States lying west of official-Illinois and southern territories, including east-bank Mississippi River crossings in Illinois on western trunk-line territory traffic, north of southwestern territory and New Mexico, and on and east of the following line: The western boundaries of the States of North Dakota, South Dakota, and Nebraska south to the main line of the Union Pacific Railroad, thence along that railroad to Cheyenne, Wyo., thence south on the line of the Colorado & Southern Railway and paralleling railroads passing through Denver, Colorado Springs, and Trinidad, Colo., to the southern border of Colorado.

Mountain Pacific territory. — All that part of the United States lying west of western trunk-line and southwestern territories.

Territories used for the purpose of the cost study:

For the purpose of determining territorial costs, the five territories described above were increased to twelve for the purpose of anticipating, if possible, the additional information the Commission may need in these proceedings. For example, it was felt that within the Official territory there are at least three areas having different operating characteristics, namely, the New England states, the Pocahontas territory, and the remaining area in Official territory. Furthermore, it was also felt desirable to compute costs separately for the operations of the Western Trunk Line Railroads in northern Illinois. This permitted the operations of these railroads in and around Chicago to be included in the Eastern territory, the Western Trunk Line territory or both as the Commission may see fit. Under the description of the territories appearing in the Commission's order of January 9, 1940, referred to above, such operations belong in the Official territory. On the other hand, if cost scales are desired applicable to traffic moving from the industrial areas of northern Illinois westbound into Western Trunk Line territory, a closer approximation of the costs is obtained by grouping the operations of the Western Trunk Line railroads in northern Illinois with the operations of the same railroads in Western Trunk Line territory than would be obtained by using the Official territory cost scales for the movement across northern Illinois and the Western Trunk Line cost scale beyond.

This same situation exists as to southern Missouri which, while lying in Western Trunk Line Territory, nevertheless contains important terminal operations of the Southwestern carriers. It was originally planned to set apart the costs for all the rail operations of the Southwestern carriers in southern Missouri for inclusion with either the Western Trunk Line Territory or the Southwestern Territory as might be found desirable. Practical difficulties in obtaining the data within the limited time available precluded the adoption of this plan, however, and the separation was ultimately limited to the operations of two Southwestern railroads in southern Missouri, namely the Kansas City Southern and the Missouri-Kansas-Texas Railroad. While the Missouri operations of these two railroads technically belong in Western Trunk Line Territory, the lines serve as feeders for Southwestern Territory, and hence the cost scales show them grouped solely with the Southwestern carriers, although the data assembled permits of their inclusion in either territory.

The description of the territories and a list of the railroads or divisions of railroads assigned to each are provided below. 1/

Territories for which cost data computed:

Territorial designation No.	Territory	Description of territory
1	New England	New England States
2	Eastern, excluding New England and the operation of the Western Trunk Line Railroads in northern Illinois.	Includes the Official Territory (and Illinois Territory) as defined by the Commission in Appendix A of its order dated Jan. 9, 1940, minus however, the following: (a) New England States (b) Pocahontas railroads (c) Operations of the Western Trunk Line railroads in northern Illinois.
3	Eastern, excluding New England but including the operation of the Western Trunk Line railroads in northern Illinois.	Same as for Territory 2 except that it includes the operations of the Western Trunk Line Railroads in northern Illinois.

1/ See map of territories in cost scales (frontispiece).

Territories for which cost data computed: - Continued

Territorial designation No.	Territory	Description of territory
4	Total Eastern, including New England and the operations of the Western Trunk Line railroads in northern Illinois.	Same as Territory 3 plus New England Territory.
5	Pocahontas	Total operations of the Chesapeake & Ohio, Norfolk and Western, and the Virginian Railroads including those portions of these railroads extending into the Eastern and Southern Territories.
6	Southern	All that part of the United States lying south of Official Territory and east of the Mississippi River but including the total system operations of the Southern Railway and the Richmond, Fredericksburg & Potomac Railroad.
7	Southwestern including southern Missouri.	States of Arkansas, Oklahoma, Texas and Louisiana west of the Mississippi River, and the operations in southern Missouri of the Kansas City Southern Ry. and the Missouri-Kansas-Texas Railroad. 1/

1/ The operations of the St. Louis-San Francisco Railway and the St. Louis Southwestern Railway in southern Missouri are included in Southwestern Territory. Part of the operations of the Missouri Pacific Railroad in southern Missouri are included in Western Trunk Line Territory and part in Southwestern Territory. That part included in Southwestern Territory consists principally of the Illinois Division paralleling the Mississippi River.

Territories for which cost data computed: - Continued

Territorial designation No.	Territory	Description of territory
8	Western Trunk Line, excluding the operations of the Western Trunk Line railroads in northern Illinois and the operations of Southwestern railroads in southern Missouri.	All of that part of the United States lying west of Official-Illinois and Southern Territories, north of Southwestern Territory and New Mexico and east of the following line: Western boundaries of the States of North Dakota, South Dakota, and Nebraska, south to the main line of the Union Pacific Railroad, thence along that railroad to Cheyenne, Wyo.; thence south on the line of the Colorado and Southern Railway and paralleling railroads passing through Denver, Colorado Springs, and Trinidad, Colorado, to the southern border of Colorado.
9	Western Trunk Line, including the operations of the Western Trunk Line railroads in northern Illinois but excluding the operations of Southwestern railroads in southern Missouri.	Same as Territory No. 8 except for the inclusion of the operations of the Western Trunk Line railroads in northern Illinois.
10	Mountain-Pacific	All that part of the United States lying west of Western Trunk Line and Southwestern Territories.
11	Total Western, including Southwestern, Western Trunk Line, Mountain-Pacific, northern Illinois and southern Missouri.	Includes Southwestern Territory, Western Trunk Line Territory, Mountain Pacific Territory, and the operations of the Western Trunk Line railroads in northern Illinois and the operations of Southwestern railroads in southern Missouri.

Territories for which cost data computed: - Continued

Territorial designation No.	Territory	Description of territory
12	Total United States	Includes all operations within the United States.
	Operations of Western Trunk Line railroads in northern Illinois.	Operations of Western Trunk Line railroads **in northern Illinois insofar as they could be separated.**
	Operations of Southwestern railroads in southern Missouri.	Operation of the Kansas City Southern Railway and the Missouri-Kansas-Texas Railroad in southern Missouri.

The above description of the territories is somewhat approximate as it was not practicable to cut the lines of certain railroads exactly at the boundaries indicated. For this reason, the above territorial descriptions are useful in generally indicating the geographical extent of each of the territories.

List of the railroads or divisions thereof assigned to each territory:

In the preceding paragraph a description has been given of the territories in terms of their geographical boundaries. There follows herewith a list of the railroads, or divisions of railroads, which were assigned to each territory. As a railroad division constitutes the smallest part of a railroad for which a subdivision could be made from currently compiled statistics, it necessarily follows that there is a small amount of error resulting from some part of a division extending across the geographical boundary indicated. However, the cases in which this situation arises have a negligible bearing on the results. The railroads or divisions thereof assigned to each territory are as follows:

1. New England:

Bangor & Aroostook R. R.
Boston & Albany R. R.
Boston & Maine R. R.
Canadian National Lines in New England
Canadian Pacific Ry. (Lines in Vermont)
Central Vermont Ry.
International Ry. Co. of Maine

1. New England: - Continued

Maine Central R. R.
New York Connecting R. R.
New York, New Haven & Hartford R. R.
Rutland R. R.

2. Eastern, excluding New England and the operations of the Western Trunk Line Railroads in Northern Illinois:

Akron, Canton & Youngstown Ry.
Ann Arbor R. R.
Baltimore & Ohio R. R.
Bessemer & Lake Erie R. R.
Cambria & Indiana R. R.
Central R. R. of New Jersey
Chicago & Eastern Illinois Ry.
Chicago & Illinois Midland Ry.
Chicago, Indianapolis & Louisville Ry.
Chicago, Milwaukee, St. Paul & Pacific R. R., - Terre Haute Division extending roughly from Chicago to Terre Haute, Ind.
Delaware & Hudson R. R.
Delaware, Lackawanna & Western R. R.
Detroit & Mackinac Ry.
Detroit & Toledo Shore Line R. R.
Detroit, Toledo & Ironton R. R.
Elgin, Joliet & Eastern Ry.
Erie R. R. (incl. Chicago & Erie)
Grand Trunk Western R. R.
Illinois Central R. R., - Illinois, Springfield and St. Louis Divisions extending roughly between Clinton, St. Louis and Indianapolis.
Illinois Terminal R. R.
Lehigh & Hudson River Ry.
Lehigh & New England R. R.
Lehigh Valley R. R.
Long Island R. R.
Louisville & Nashville R. R., - operations in the State of Illinois extending roughly between East St. Louis and McKeansboro, Ill.
Missouri-Illinois R. R.
Monongahela Ry.
Montour R. R.
New York Central Railroad, - including the operation of the Michigan Central and Cleveland, Cincinnati, Chicago and St. Louis R. R. but excluding the Boston and Albany R. R.
New York, Chicago & St. Louis R. R.
New York, Ontario & Western Ry.
New York, Susquehanna & Western R. R.
Pennsylvania R. R.
Pennsylvania-Reading Seashore Lines

2. Eastern, excluding New England and the operation of the Western Trunk Line Railroads in Northern Illinois: - Continued

Pere Marquotte Ry.
Pittsburgh & Lake Erie R. R.
Pittsburg & Shawmut R. R.
Pittsburgh & West Virginia Ry.
Pittsburg, Shawmut & Northern R. R.
Reading Co.
Staten Island Rapid Transit Ry.
Toledo, Peoria & Western R. R.
Wabash Ry., - Lines East of the Mississippi River
Western Maryland Ry.
Wheeling & Lake Erie Ry.

3. Eastern, excluding New England but including the operation of the Western Trunk Line Railroads in Northern Illinois:

This territory includes all of the railroads designated under Territory No. 2 above and, in addition, those operations designated as "Operation of Western Trunk Line Railroads in Northern Illinois". The railroads included in this latter designation are as follows:

Alton Railroad, - Chicago Terminal, Eastern and Western Divisions (Illinois Lines)
Atchison, Topeka and Santa Fe, - The Chicago Terminal and Illinois Divisions
Chicago and North Western Railway, - operations in the State of Illinois
Chicago, Burlington & Quincy R. R., - operations in the State of Illinois
Chicago Great Western Railroad, - Illinois Division
Chicago, Milwaukee, St. Paul & Pacific Railroad, - Chicago Terminal, Dubuque and Illinois, Milwaukee, and Milwaukee Terminal Divisions
Chicago, Rock Island and Pacific, - Chicago and Rock Island Divisions
Illinois Central Railroad Company, - Chicago Terminal Division

4. Eastern, including New England and the operations of the Western Trunk Line railroads in Northern Illinois:

Lines included are those designated above under Territories Nos. 1 and 3.

5. Pocahontas Territory:

Chesapeake & Ohio Railway 1/
Norfolk & Western Railway
Virginian Railway

6. Southern Territory:

Alabama Great Southern R. R.
Atlanta & West Point R. R. (incl. Western Ry. of Ala.)
Atlanta, Birmingham & Coast R. R.
Atlantic Coast Line R. R.
Central of Georgia Ry.
Charleston & Western Carolina Ry.
Cincinnati, New Orleans & Texas Pacific Ry.
Clinchfield R. R.
Columbus & Greenville Ry.
Florida East Coast Ry.
Georgia R. R. - Lessee Organization
Georgia & Florida R. R.
Georgia Southern & Florida Ry.
Gulf & Ship Island R. R.
Gulf, Mobile & Northern R. R.
Illinois Central R. R., -- Kentucky, Mississippi and Louisiana Divisions and Memphis and New Orleans Terminal Divisions

---

1/ The cost data of the Chesapeake and Ohio were initially set up on the following three bases:
(a) The operations in Eastern Territory (i.e., the States of Indiana, Ohio, and Illinois) were separated from the remaining operations in Pocahontas Territory on the somewhat arbitrary basis maintained by the carrier for state purposes.
(b) The aggregate of the system expenses and statistics were separated between territories on the basis of the approximate separation developed under (a). This procedure maintained the system average unit costs in each territory. (Treatment similar to that given Union Pacific described elsewhere in this chapter.)
(c) All operations were included in the Pocahontas Territory.
The differences in the Eastern and Pocahontas territorial cost scales resulting from the three procedures outlined above were negligible. However, inasmuch as the consist of the traffic handled in Indiana, Ohio, and Illinois approximated that handled in West Virginia and Kentucky, it was decided to include all the operations of the Chesapeake and Ohio in Pocahontas Territory.

6. Southern Territory: - Continued

Louisville & Nashville R. R., - operations in the States of Indiana, Ohio, Virginia, Kentucky, Tennessee, Missouri, North Carolina, Louisiana, Mississippi, Georgia, Alabama, and Florida.
Mississippi Central R. R.
Mobile & Ohio R. R.
Nashville, Chattanooga & St. Louis Ry.
New Orleans & Northeastern R. R.
Norfolk Southern R. R.
Northern Alabama Ry.
Richmond, Fredericksburg & Potomac R. R.
St. Louis-San Francisco Ry. - States of Alabama, Florida, Mississippi, and Tennessee
Seaboard Air Line Ry.
Southern Ry.
Tennessee Central Ry.
Yazoo & Mississippi Valley R. R.

7. Southwestern including operations of Southwestern railroads in Southern Missouri:

The railroads included in Southwestern Territory are the following:

Atchison, Topeka & Santa Fe, - Oklahoma, Slaton & Plains, Northern, Southern, and Gulf Divisions, and the Panhandle and Santa Fe Ry.
Burlington-Rock Island R. R.
Chicago, Rock Island & Pacific Ry. (incl. Chicago, Rock Island and Gulf Railway), - Oklahoma, Southern, Arkansas and Panhandle Divisions
Fort Worth & Denver City Ry.
Gulf Coast Lines and Subsidiaries
International-Great Northern R. R.
Kansas City Southern Ry., - Southern Division
Kansas, Oklahoma & Gulf Ry.
Louisiana & Arkansas Ry.
Louisiana & Arkansas of Texas
Midland Valley R. R.
Missouri & Arkansas Ry.
Missouri-Kansas-Texas R. R. (including the Missouri-Kansas-Texas of Texas), - operations in the States of Oklahoma and Texas comprising the Southern, North Texas, South Texas, and Northwestern Districts
Missouri Pacific R. R., - comprising the Illinois, Arkansas, Memphis, Little Rock, Central, and Louisiana Divisions
Oklahoma City-Ada-Atoka Ry.

7. Southwestern including operations of Southwestern railroads in Southern Missouri: - Continued

St. Louis-San Francisco Ry. - operations in States of Missouri, Kansas, Oklahoma, Arkansas, and Texas
St. Louis, San Francisco and Texas Ry.
St. Louis Southwestern Ry. (including St. Louis Southwestern of Texas)
Texas & New Orleans R. R.
Texas & Pacific Ry.
Texas Mexican Ry.

The railroads designated as "operation of Southwestern roads in Southern Missouri" are as follows:

Kansas City Southern Ry., - Kansas City Terminal and Northern Divisions
Missouri-Kansas-Texas Railroad, - States of Missouri and Kansas comprising the Northern District

8. Western Trunk Line, excluding the operations of the Western Trunk Line railroads in Northern Illinois and the operations of Southwestern railroads in Southern Missouri:

Alton R. R. - That part of the Western Division comprising the Louisiana and Missouri River Railroad and the Kansas City, St. Louis and Chicago Railroad
Atchison, Topeka & Santa Fe Ry., - the Missouri, Kansas City, Eastern, Middle, Southern Kansas, Panhandle, Western and Colorado Divisions
Chicago & North Western Ry., - All operations except those in the States of Illinois, Montana, and Wyoming
Chicago Great Western R. R., - the Minnesota Main Line, Minnesota Branch Line, Iowa, and Minnesota (Mason City and Ft. Dodge) Divisions
Chicago, Milwaukee, St. Paul & Pacific R. R., - the Hastings and Dakota, Iowa and So. Minnesota, Trans-Missouri, Iowa and Dakota, LaCrosse and River, Iowa, Duluth, Twin Cities Terminal, Kansas City, Madison, Superior, Iowa and Southern Divisions
Chicago, Rock Island & Pacific Ry., - the Des Moines, Cedar Rapids, Western, and Missouri-Kansas Divisions
Chicago, St. Paul, Minneapolis & Omaha Ry.
Duluth, Missabe & Iron Range Ry.
Duluth, South Shore & Atlantic Ry.
Duluth, Winnipeg & Pacific Ry.
Great Northern Ry., - all lines in the States of Minnesota, Iowa, North Dakota, and South Dakota and the Midland Railway Company of Manitoba
Green Bay & Western R. R.

8. Western Trunk Line, excluding the operations of the Western Trunk Line railroads in Northern Illinois and the operations of Southwestern railroads in Southern Missouri: - Continued

Illinois Central R. R., - Iowa Division, including Freeport District
Lake Superior & Ishpeming R. R.
Minneapolis & St. Louis R. R.
Minneapolis, St. Paul & Sault Ste. Marie, including Wisconsin Central Ry.
Missouri Pacific R. R., - Eastern, Central Kansas, Omaha, Wichita, St. Louis Terminal, Joplin, Missouri, Southern Kansas, and Kansas City Terminal Divisions
Northern Pacific R. R., - lines east of Mandan, North Dakota
Union Pacific R. R., - lines east of Cheyenne, Wyoming
Wabash Ry., - lines west of the Mississippi River

9. Western Trunk Line, including the operations of the Western Trunk Line railroads in Northern Illinois but excluding the Southwestern railroads in Southern Missouri:

This territory includes the railroads designated in Territory No. 8 above plus the railroad operations designated as "operations of Western Trunk Line railroads in Northern Illinois". These latter railroads or portions thereof have already been listed above under Territory No. 3.

10. Mountain Pacific Territory:

Atchison, Topeka & Santa Fe Ry., - the New Mexico, Albuquerque, Arizona, Pecos, Los Angeles, Valley, and San Francisco Terminal Divisions
Chicago & North Western Ry., - State of Wyoming
Chicago, Burlington & Quincy R. R., - States of Montana and Wyoming
Chicago, Milwaukee, St. Paul & Pacific R.R., - Coast and Rocky Mountain Divisions
Colorado & Southern Ry.
Denver & Rio Grande Western R. R.
Denver & Salt Lake Ry.
Great Northern Ry., - lines in the States of Montana, Idaho, Washington, Oregon, and California, and the Nelson and Ft. Shepard Ry., and the Vancouver, Victoria & Eastern Ry. and Navigation Co.
Nevada Northern Ry.
Northern Pacific Ry., - lines west of Mandan, North Dakota
Northwestern Pacific R. R.
Southern Pacific Co. - Pacific Lines
Spokane International Ry.
Spokane, Portland & Seattle Ry.

10. Mountain Pacific Territory: - Continued

Union Pacific R. R., - lines west of Cheyenne, Wyoming
Utah Ry.
Western Pacific R. R.

11. Total, Western Territories:

Includes all the railroads or portions thereof listed under the Southwestern Territory (including operations of Southwestern railroads in southern Missouri), the Western Trunk Line Territory, (including the operations of the Western Trunk Line railroads in northern Illinois) and the Mountain Pacific Territory. See Territories Nos. 7, 9, and 10 above.

12. Total for United States:

Total for all territories, excluding duplications.

As explained in Chapter IV, all cost computations were carried out in full for each railroad individually. Furthermore, where a railroad was assigned to more than one territory, the data were compiled both for the system and for each of the parts. This procedure permits of any desired grouping of the railroads, or, if necessary, the development of the cost scales for individual carriers.

CHAPTER III

Territorial ~~Rate~~ Cost Comparisons

The cost scales and other data developed as a result of this study permit of innumerable territorial comparisons depending upon the phase of the subject under study. A few of the more significant comparisons are shown below. 1/ The cost scales show the costs by types of equipment for ranges of net loads and lengths of haul. A comparison of territorial figures for any given net load serves to indicate the relative cost in each territory providing the load is everywhere the same. Where the load is different, the cost should be based on the loading actually experienced in each territory. This is necessary as the cost is a function of the weight of the load.

Comparisons based on box car traffic assuming uniform load:

Table 1 shows the relative costs in each territory for revenue carload freight moving in box cars for a haul of 300 miles and a net load of 25 tons. For purposes of comparison an index is shown, the costs for the United States average being taken as 100. The cost data are taken from the accompanying cost scales and are based upon the territorial average ratio of empty car-miles to loaded car-miles for box cars. Loss and damage payments are not included. The relative costs are as follows:

New England	- Well above average
Eastern Territories, Southwestern, Western Trunk Line and Mountain Pacific	- Average or a little above
Southern	- A little below average
Pocahontas	- Well below average

For purposes of these comparisons, the data appearing in columns (5) and (7) of Table 1 are those most significant. The costs shown in column (3) while representing a figure which is above out-of-pocket costs nevertheless is something less than a "subsistence" level as measured in terms of minimum revenue needs on carload traffic.

1/ The comparisons shown are based upon and subject to the approximations in the basic data outlined in Chapter VI.

Table 1. Cost in Cents Per Hundred Pounds of Revenue Carload Freight Moving in Box Cars with a Net Load of 25 Tons a[illegible]a Haul of 300 Miles 1/

Territory	Assumed load (tons)	Cost Level II: Carload operating expenses, rents, and taxes		Cost Level IV: Carload operating expenses, rents, and taxes including allowance for less-carload and passenger operating deficits		Cost Level V(b): Carload operating expenses, rents, and taxes including allowance for less-carload and passenger operating deficits, and 5-3/4% return on total value	
		Cost	Index	Cost	Index	Cost	Index
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
1. New England	25	13.2	119	15.4	118	24.6	134
2. Eastern, excluding New England and Northern Illinois	25	11.6	105	13.1	101	18.6	102
3. Eastern, excluding New England but including Northern Illinois	25	11.6	105	13.2	102	18.8	103
4. Eastern, including New England and Northern Illinois	25	11.6	105	13.2	102	18.9	103
5. Pocahontas	25	9.1	82	9.9	76	13.4	73
6. Southern	25	10.4	94	12.1	93	17.2	94
7. Southwestern, including Southern Missouri	25	11.1	100	13.3	102	18.0	98
8. Western Trunk Line, excluding Northern Illinois and Southern Missouri	25	11.0	99	13.5	104	18.9	103
9. Western Trunk Line, including Northern Illinois but excluding Southern Missouri	25	11.1	100	13.7	105	19.3	105
10. Mountain Pacific	25	11.0	99	13.2	102	18.8	103
11. Total Western Territory	25	11.1	100	13.4	103	18.9	103
12. Total, United States	25	11.1	100	13.0	100	18.3	100

1/ Source: Cost scales. For purposes of comparison the index of cost for the United States equals 100.

Comparisons based on the average net load obtaining in Southern and Eastern Territories:

The average weight for traffic handled in box cars varies somewhat between territories. However, in making comparisons it is not possible to base the costs for each territory on the average load for all commodities moving in box cars in that territory as the results would reflect not merely the differences in the unit costs of operation but also the differences in the cost of hauling unlike commodities. To overcome this difficulty the procedure may be followed of first computing the cost of hauling the Southern Territory box-car traffic a distance of 300 miles at the average load for each commodity and unit cost thereof obtaining in the South, and secondly, computing the cost of hauling the identical Southern traffic a distance of 300 miles at the average loads and unit costs obtaining in Eastern Territory (Terr. No. 2). 1/ By this process the general average cost found for the Southern Territory would be between 5 and 6 percent lower than that found for the Eastern Territory.

1/ The total tonnage for the commodities handled in box cars in the Southern Territory in 1939 amounted to 65,532,453 tons. (From Freight Commodity Statistics, Statement 40100). The number of carloads required to handle this traffic amounted to 2,821,368. The weighted average load per car was 23.2 tons. If this identical traffic were handled in Eastern Territory, 2,746,992 cars would have been required, at an average of 23.9 tons per car. These latter figures were obtained by dividing the tonnage for each commodity class by the average load for that class obtaining in Eastern Territory No. 2. (For purposes of obtaining average loads the tonnage and carloadings of the Great Lakes and Central Eastern Regions combined were treated as equivalent to Territory No. 2). Costs were computed based respectively upon the weighted averages of 23.2 and 23.9 tons. The figures for the Southern and Eastern Territories were respectively as follows: Cost Level II - 11.0 and 12.0 cents; Cost Level IV - 12.8 and 13.6 cents; and Cost Level V(b) - 18.1 and 19.2 cents.

Under Cost Levels IV and V(b) the costs for the South are between 5 and 6 percent below those for the Eastern Territory.

The procedure was then reversed. The box car traffic for the Eastern Territory No. 2 was found to consist of 185,898,674 tons handled in 7,819,032 cars, or at an average of 23.8 tons per car. This same tonnage if handled in Southern Territory at the average load prevailing in Southern Territory would have required 7,916,885 cars or an average load of 23.5 tons. The costs for the Eastern and Southern Territories were respectively as follows: Cost Level II - 12.1 and 10.9 cents, Cost Level IV - 13.7 and 12.7 cents, and Cost Level V(b) - 19.3 and 18.0 cents.

Under Cost Levels IV and V(b) the costs for the Southern Territory were found to be between 6 and 7 percent below those for the Eastern Territory.

The commodities assumed to move in the respective classes of equipment are shown in Appendix C.

U The procedure then may be reversed by computing the cost of handling the Eastern Territory box car traffic for a 300-mile haul first in the Eastern Territory and secondly in Southern Territory. The cost thus found for the Southern Territory would be between 6 and 7 percent lower than that found for the Eastern Territory.

The same procedure may be followed for traffic customarily moving in gondola and hopper cars. Assuming that the consist of Southern traffic was handled first, in Southern Territory and secondly, in the Eastern Territory, the average Southern cost would be 1 or 2 percent below that for Eastern Territory. The average loads developed were 48.3 and 49.5 tons respectively. On the other hand if one assumed that the consist of the Eastern traffic were moved first in Eastern Territory and secondly in Southern Territory the result would indicate that the average cost for the South exceeded that for the East by about 7 percent. The average loads developed for South and East in this case were [illegible] 40.3 tons and [illegible] 45.0 tons respectively. The reason for this unfavorable showing for the South is the lighter average loading which in turn is occasioned by substantial differences in the character of the gondola traffic in each territory. The traffic moved in the South consists to a large degree of commodities which have like loading characteristics in each territory. On the other hand the Eastern Territory has substantial movements of certain commodities such as ore which in the South not only move in a relatively smaller volume but also have a lighter loading. Where the consist of the traffic is unlike to the degree here indicated the comparisons have limited significance.

Comparisons based on United States consist of box car traffic:

The above comparisons might have been carried on indefinitely by comparing each territory with each of the others. To shorten the process, the simplified procedure was adopted of computing the relative territorial cost on the assumption that the total United States traffic (1939) customarily moving in box cars was hauled a distance of 300 miles in each territory at the average load for the individual commodities obtaining in each territory. The aggregate cost by territories then was obtained by multiplying the cost per ton by the tonnage handled of each individual commodity and adding the products together. The comparison also may be made by computing the average load by territories weighted as above by the United States consist of commodities and taking the cost for that load directly from the cost scale. This latter method was followed principally although limited use was made of the former method for purposes of verification.

The weighted average load for box cars by territories was obtained as follows: The United States total tonnage carried of each commodity customarily moving in box cars 1/ was divided by the territorial

---

1/ See Freight Commodity Statistics, Classes 10-101, 150-162, 164, 260-271, 282, 380, 402, 430-440, 442, 443, 452, 453, 470, 471, 512, 520-540, 551-561, 580, 581, 590-620, 640-651, 662-691, 694-701.

average loading for that commodity. This gave the number of cars that would be required in each territory to handle the total United States tonnage of that commodity. The aggregate of the number of cars thus computed by territories for all commodities, divided into the aggregate tonnage for all commodities, produced the weighted average loading by territories shown in Table 2, column (2). The statistical data were taken from the Freight Commodity Statistics for 1939. The data for the Central Eastern and Great Lakes Regions were consolidated to form the Eastern Territory, No. 2. For lack of better information, the average loading for Territory No. 2 also was used for Territory No. 3. As the boundaries of the Southwestern Region (Freight Commodity Statistics) approximate those for the Southwestern Territory, No. 7, the statistical data for the former were used in obtaining average loads for the latter. No data were available on average loads for the Western Trunk Line and Mountain Pacific Territories and hence no comparisons are shown in Table 2 for them. The territorial boundaries of the remaining regions and districts compared closely with those for the territories established in this study.

From the results shown in Table 2, it will be noted that the relation of the territories remains practically unchanged from that found in Table No. 1. The costs for the New England Territory are well above the average, those for the Eastern, Southwestern, and total Western Territories are average or a little above average, those for the Southern Territory are a little below average, while those for the Pocahontas Territory are well below the average.

Table 2. Cost in Cents Per Hundred Pounds Assuming that the Total United States Traffic Customarily Moving in Box Cars Was Hauled 300 Miles in Each Territory at the Average Load for the Individual Commodities Obtaining in Each Territory 1/

Comparisons based on 50 ton loads in gondola and hopper cars:

The same comparison as that shown above for box cars in Table 1 is repeated below for the traffic handled in gondolas and hopper cars. Table 3 shows the relative costs assuming a uniform load of 50 tons in all territories. 1/ The relative costs were found to be as follows:

New England - Well above average

Eastern, Southern,)
Southwestern, Western)
Trunk Line and Mountain) - About average
Pacific Territories)

Pocahontas - Well below average

The relatively less favorable position of the Southern Territory is explained by the relatively high percent empty return for gondola and hopper cars reported by the Southern roads.

1/ United States average is 50.6 tons, 1939.

Average loads by types of equipment:

The cost comparison shown in Table 3 is only valid where the load in each territory is assumed to be the same. This condition does not obtain as indicated by Table 4 which shows the weighted average load by types of equipment based upon the United States consist of the traffic customarily moving in each type of equipment. The data were compiled on the basis described hereinabove for box cars.

Table 4. Average Weight of Load by Types of Equipment and by Territories Assuming that the Total United States Traffic Customarily Moving in Each Type of Equipment Shown Was Hauled in Each Territory at the Average Load for the Individual Commodities Obtaining in Each Territory

Territory	Box	Gondola and hopper	Flat	Stock	Refrigerator	Tank

*No data as to average load.

5816

5170

From Table 4 it will be noted that where the consist of the traffic is the same the territorial average loads for each type of equipment are very similar except in the case of gondola and hopper cars and flat cars. The further conclusion may be drawn that where the territorial average loads for box cars (based on the consist of the box car traffic moving in each territory) are found to differ, such difference is principally occasioned by the fact that the territories are handling different proportions of heavy-loading or light-loading commodities. Costs based upon such average loads, therefore, reflect not merely territorial differences in the unit costs of operation, but also the usual differences in cost arising from the handling of unlike commodities.

Comparisons for anthracite and bituminous coal:

The principal classes of traffic customarily handled in gondola and hopper cars are anthracite and bituminous coal. Table 5 provides cost comparisons based upon the average loading of anthracite coal in gondola and hopper cars experienced for each territory (1939). It will be noted that the relative costs for the Southern, Southwestern and Western Territories rises sharply compared to the average for the United States. This is explained by the lighter loading reported for anthracite in these territories.

The same comparison is made in Table 6 for bituminous coal. It will be noted that the costs shown for the Southern Territory approximate the United States average while those for the Western Territories exceed the United States average. The difference between this showing and that appearing in Table 3 (based on 50 ton loads) is accounted for by the territorial differences in the loading of bituminous coal.

Table 5. Cost in Cents Per Hundred Pounds for Anthracite Coal for a 300-Mile Haul in Each Territory. Based on the Average Net Load Obtaining in Each Territory 1/

Territory (1)	Average load (tons) (2)	Cost Level II: Carload operating expenses, rents, and taxes		Cost Level IV: Carload operating expenses, rents, and taxes including allowance for less-carload and passenger operating deficits		Cost Level V(b): Carload operating expenses, rents, and taxes including allowance for less-carload and passenger operating deficits, and 5-3/4% return on total value

11. Total Western Territory	30.3	10.8	142	13.1	147	18.4	147
12. Total, United States	50.1	7.6	100	8.9	100	12.5	100

*No data on average net loads available.

1/ Source: Cost scales with interpolation where necessary. For purposes of comparison, the index of cost for the United States equals 100.

Comparisons on less-carload traffic:

The above comparisons all have been based on carload traffic. Table 7 below provides a comparison based on less-carload traffic. The explanation made hereinabove that the costs represent a weighted average of all operating conditions, i.e., through trains, way trains, etc., is reiterated. If any commodity or any class of traffic characteristically moves in a heavier than average, or lighter than average trains, the costs developed for that commodity or class of traffic will be in some measure overstated or understated. Attention is called in Table 7 to the comparatively low costs for handling less-carload traffic on the Pocahontas Lines. This cost is correct only if the less-carload traffic is handled in the average weight train operated by these lines. Should this traffic be handled in relatively light-weight merchandise trains the costs shown are understated in some degree. [1]

The costs shown in Table 7 are based on an assumed average load of 5 tons. The costs for New England, Western Trunk Line and Mountain Pacific Territories exceed the United States average, those for the Eastern and Southwestern Territories approximate such average, while the costs for the Pocahontas and Southern Territories are below the average. As explained in Chapter VI, the less-carload cost data are subject to some error in certain territories because of the failure to obtain an accurate separation of the station expenses between clerical and platform. This error is not sufficient, however, to change significantly the territorial relationships shown.

Table 8 shows the cost based on the territorial average load developed from the data appearing in Senate Resolution 146, 76th Congress, 1st Session, Railway Handling of Less-than-carload Freight, Forwarder Traffic, page 17, column 15. Based on Table 8 the costs for the New England and the Western Territories exceed the average while those for the Eastern, Pocahontas and Southern Territories are below the average. The low cost shown for the Eastern Territories is attributable to the relatively high average load experienced.

---

[1] See discussion of the effect of the weight of the trainload on cost, Chapter VI.

1/ Source: Cost scales. For purposes of comparison the index of cost for the United States equals 100.

Comparisons between railroads within a territory:

Very substantial variations exist in the costs for individual railroads within a territory. Tests were made in this matter by developing cost scales for Cost Levels II, IV and V and for distances of 50, 100, 300 and 500 miles. The railroads selected were the following:

New England:
- Boston & Maine R.R.
- Maine Central R.R.
- New York, New Haven & Hartford R.R.

Eastern, excluding New England:
- Baltimore & Ohio R.R.
- Erie R.R.
- Lehigh Valley R.R.
- New York Central R.R.
- Pennsylvania R.R.

Southern:
- Atlantic Coast Line R.R.
- Seaboard Air Line Ry.
- Southern Ry.

Southwestern:
- St. Louis Southwestern Ry.
- Texas & New Orleans R.R.
- Texas & Pacific Ry.

Mountain Pacific:
- Denver & Rio Grande Western R.R.
- Southern Pacific
- Western Pacific R.R.

Although the cost comparisons were based on identical lengths of haul and identical loads (25 tons moving in box cars) the variations found between carriers in every territory ranged from 10 to 15 percent and in some territories were still higher. Each carrier's costs were based on the percent empty return reported by it for box cars, except in the case of the New York Central where the territorial average was used, no data being available. The differences in the percent of empty return movement were not great enough to account for more than a very small portion of the differences in costs between carriers. These comparisons did not reflect the added variations in cost that would be occasioned by the differences in the circuity of the respective routes for competing railroads.

Comparisons for other lengths of hauls:

The above figures represent but a few of the comparisons available from the cost scales, reference to which will provide the data for any desired length of haul. Comparisons based on shorter or longer hauls than 300 miles would change the relationships in some degree. On short hauls of 50 miles the percent by which the cost shown for New England exceeds the United States average would be reduced while the advantage shown for the Southern Territory would be increased. On hauls longer than 300 miles the relatively high cost for the New England Territory would be still further increased while the relative advantage enjoyed by the Southern Territory (box car traffic) would be decreased. This is explained by the fact that while the terminal costs in New England approximate the United States average, the line-haul costs are substantially in excess of such average. The terminal costs for the Southern Territory are substantially lower than the United States average while the line-haul costs are only slightly lower.

Compensatory character of rate structures:

The comparisons shown above have dealt with individual traffic movements. The following comparisons are for the purpose of testing the compensatory character of territorial rate structures, less-carload, carload and passenger. The territories shown were selected to avoid, insofar as possible, the need for a territorial separation of a carrier's revenues.

Compensatory character of less-carload rate structures:

The compensatory character of the less-carload rate structures by territories may be tested by comparing the territorial less-carload expenses with the territorial less-carload revenues. A comparison follows based insofar as possible on the territorial grouping established for the purpose of this study.

Table 9. Comparison of Less-carload Revenues with Less-carload Expenses Based on the Territorial Grouping Used for This Study

Territory 1/ (1)	Less-carload revenues 2/ (2)	Less-carload operating expenses, rents and taxes, plus payments to others for pick-up and delivery 3/ (3)	Deficit (4)
New England	$17,493,370	$21,040,227	$3,546,857
Eastern, excluding New England and northern Illinois	89,923,687	115,402,315	25,478,628
Total Eastern, including New England but excluding northern Illinois	107,417,057	136,442,542	29,025,485
Pocahontas	8,742,308	9,542,851	800,543
Southern	46,484,178	49,506,990	3,022,812
Western (including northern Illinois	88,688,184	124,078,980	35,390,796
United States	251,331,727	319,571,363	68,239,636

1/ Although the territories were grouped to eliminate as far as possible the need for separating the revenues of an individual railroad between territories, such separation nevertheless had to be made in the following six cases: Separation of the New York Central between the Boston and Albany and all other lines; separation of the Louisville and Nashville between Southern Territory and the Eastern Territory; separation of the Chicago, Milwaukee, St. Paul and Pacific between Western Territory and Eastern Territory; separation of the Illinois Central between Southern, Eastern and Western Territories; separation of St. Louis-San Francisco between Southern and Southwestern Territories; separation of the Wabash between Lines East and West of the Mississippi. Except in the case of the B.& A. the territorial separations of the revenues and the payments to others for pick-up and delivery were made on the basis of the less-carload expenses. This treatment was followed as the costs closely reflect the distribution of the volume of less-carload traffic which in turn provides a measure for the distribution of the revenues received from such traffic. The revenues of the Boston and Albany were obtained direct from Freight Commodity Statistics, Statement No. 40100.

2/ From Annual Report, schedule 541, class 710, column (1).

3/ Costs shown consist of Cost Level II plus payments for pick-up and delivery service from Annual Report, schedule 310, sum of lines (a), (b), and (c) in footnote. Costs exclude allowance for a return on value.

The following table was developed to provide a similar comparison as above but excluding any territorial separation of a carrier's revenues and expenses. Carriers operating in more than one territory have been assigned to a single territory according to the regional grouping described in the "Statistics of Railways in the United States," 1/ 1935, p. S-2, S-3.

Table 10. Comparison of Less-carload Revenues with Less-carload Expenses Based on the Assignment of Each Carrier to a Single Territory

Territory 1/ (1)	Less-carload revenues 2/ (2)	Less-carload operating expenses, rents and taxes, plus payments to others for pick-up and delivery 3/ (3)	Deficit (4)
New England	$16,573,462	$18,242,427	$1,668,965
Eastern excluding New England	89,775,200	117,275,009	27,499,809
Eastern including New England	106,348,662	135,517,436	29,168,774
Pocahontas	8,742,308	9,542,851	800,543
Southern	49,888,779	53,312,448	3,423,669
Western	86,351,978	121,198,628	34,846,650
United States	251,331,727	319,571,363	68,239,636

1/ For purposes of Table 10 the following reassignment of carriers operating in more than one territory has been made: Boston and Albany included with New York Central in Eastern Territory; Louisville and Nashville included in Southern Territory; Chicago, Milwaukee, St. Paul and Pacific included in Western Territory; Illinois Central included in Southern Territory; St. Louis-San Francisco included in Western Territory; Wabash included in Eastern Territory.

2/ From Annual Report, schedule 541, class 710, column (1).

3/ Costs shown consist of Cost Level II plus payments for pick-up and delivery service from Annual Report, schedule 310, sum of lines (a), (b), and (c) in footnote. Costs exclude allowance for a return on value.

As indicated by the above Tables 9 and 10, the less-carload revenues in all territories failed to cover the less-carload operating expenses, rents and taxes, including payments to others for pick-up and delivery. In view of this situation the significant question arises as to whether the less-carload revenues cover the out-of-pocket costs occasioned by the existence of the less-carload traffic.

Tables 11 and 12 make this comparison based on the assumption that the less-carload out-of-pocket costs constitute 80 percent 1/ of the total operating expenses, rents and taxes (excluding pick-up and delivery) assigned and apportioned to the less-carload service. The payments to others for pick-up and delivery have been added to the out-of-pocket costs so computed. Table 11 shows a comparison of the territorial revenues and expenses based on the territorial grouping used for this study. Table 12 provides a comparison with the carriers assigned solely to one territory. The territorial grouping for Tables 11 and 12 are the same as those indicated for Tables 9 and 10, respectively.

1/ Under the assumptions set forth in Chapter V hereto, the out-of-pocket portion of the less-carload operating expenses, rents and taxes approximates 68 percent of the total operating expenses, rents and taxes (Cost Level II). This percentage does not take into consideration certain taxes, other than payroll taxes, the existence of which may be occasioned by the less-carload service; the maintenance chargeable to the warehouse or platform portion of the station buildings; or the savings from the possible elimination of stations if the less-carload traffic were abandoned. No allowance is made for a return on the facilities or equipment used in this service nor for the fact that if all less-carload service were eliminated the station platform expenses found variable with the traffic volume would be 100 percent rather than 90 percent. The comparisons here being made are concerned with the out-of-pocket cost as a whole of providing the less-carload service. This concept involves assumptions somewhat different from those obtaining when the out-of-pocket cost of handling added units of less-carload traffic is under consideration.

Table 11. Comparison of Less-carload Revenues with the Less-carload Out-of-pocket Costs Based on Territorial Grouping Used for This Study

Territory (1)	Less-carload revenues 1/ (2)	Less-carload out-of-pocket costs (rail) plus payments to others for pick-up and delivery (3)	Excess or deficit as related to out-of-pocket costs (4)
New England	$17,493,370	$16,832,182	$661,188
Eastern, excluding New England and northern Illinois	89,923,687	92,321,852	d 2,398,165
Total Eastern, including New England but excluding northern Illinois	107,417,057	109,154,034	d 1,736,977
Pocahontas	8,742,308	7,634,281	1,108,027
Southern	46,484,178	39,605,592	6,878,586
Total Western	88,688,184	99,263,184	d 10,575,000
United States	251,331,727	255,657,091	d 4,325,364

d Deficit
1/ From Annual Report, schedule 541, class 710, column (1).

Table 12. Comparison of Less-carload Revenues with Less-carload Out-of-pocket Costs Based on the Assignment of Each Carrier to a Single Territory

Territory (1)	Less-carload revenues (2)	Less-carload out-of-pocket costs (rail) plus payments to others for pick-up and delivery (3)	Excess or deficit as related to out-of-pocket costs (4)
New England	$16,573,462	$14,593,942	$1,979,520
Eastern, excluding New England and northern Illinois	89,775,200	93,820,007	d 4,044,807
Total Eastern, including New England but excluding northern Illinois	106,348,662	108,413,949	d 2,065,287
Pocahontas	8,742,308	7,634,281	1,108,027
Southern	49,888,779	42,649,958	7,238,821
Total Western	86,351,978	96,958,903	d 10,606,925
United States	251,331,727	255,657,091	d 4,325,364

d Deficit.

The results shown in column (4) of the above table were based on the assumption that the rail out-of-pocket cost of maintaining the less-carload service constitutes 80 percent of the total rail less-carload operating expenses, rents and taxes. As explained in Chapter V, the figure of 80 percent necessarily represents an approximation. However, the general conclusion can be drawn that the less-carload rate structures for all territories taken together yield approximately out-of-pocket costs in the aggregate with the least favorable showing in the east and west.

Compensatory character of the passenger rate structure:

The compensatory nature of the passenger rate structure by territories may also be obtained by comparing the territorial passenger-train expenses with the territorial passenger-train revenues. This comparison is made in Table 13.

Because of the inability to separate the passenger revenues of an individual railroad between territories, the following comparison is based upon the districts and regions shown in the "Statistics of Railways in the United States," 1935, p. S-2, S-3. The territorial designation in Table 13 reading "Eastern District, excluding the New England Region," includes those railroads assigned to the Great Lakes Region and the Central Eastern Region.

Table 13. Comparison of Passenger Revenues with Passenger Expenses

Territory (1)	Operating revenues of passenger and allied services 1/ (2)	Operating expenses, rents and taxes for passenger and allied services 2/ (Cost Level II) (3)	Deficit under Cost Level II 3/ (4)
New England Region	$49,938,765	$57,502,388	$7,563,623
Eastern District excluding New England Region	275,284,818	350,354,999	75,070,181
Eastern District including New England Region	325,223,583	407,857,387	82,633,804
Pocahontas Region	12,616,785	23,293,448	10,676,663
Southern Region	74,919,313	107,313,032	32,393,219
Western District	219,275,727	344,505,931	125,230,204
United States	632,035,908	882,969,798	250,933,890

The results shown in Table 13 indicate that the passenger service fails by a substantial margin in all territories to meet the expenses assigned and apportioned to it. Table 14 was developed to provide an approximate answer to the significant question as to whether the revenues from the passenger and allied services were sufficient to cover the out-of-pocket costs occasioned by the existence of this service. For the purpose of this comparison, the out-of-pocket expenses were treated as including all expenditures solely related to the passenger service and, in addition the following: the apportioned expenses for locomotive repairs and depreciation, the apportioned expenses for yard accounts 377 to 391 (excluding account 388), the apportioned expenses for miscellaneous operations (accounts 441 to 446), the total passenger portion of equipment and joint facility rents, and the estimated passenger portion of the payroll taxes.4/ This treatment provides no allowance for the apportioned maintenance of way expenses, accounts 202-221 (a large per-cent of which is affected by use); the apportioned expense for dispatching, signal and interlocker operations and general overhead; the passenger portion of the cost of hauling nonrevenue freight traffic (approximately

---

1/ Source: Preliminary Abstfact, Summary No. 3, 1939.

2/ Source: District data from Preliminary Abstract, Summary No. 1, 1939. Regional data from Bureau of Statistics working papers used in compiling Preliminary Abstract.

3/ See also the passenger deficit by territories shown in the Cost Scales, Table 87, column (50). The difference between the deficit for the United States there shown of $291,228,105 and that appearing in Table 13 is occasioned by the allowance for the passenger portion of the cost of hauling nonrevenue freight traffic.

4/ The payroll taxes were separated between freight and passenger on the basis of operating expenses.

$40,000,000); or a return upon the investment in passenger station facilities, passenger yard facilities, and passenger train equipment. Because of the exclusion of these items, the out-of-pocket expenses shown in Table 14 undoubtedly understate the added expenses occasioned by the existence of the passenger and allied services.

Table 14. Comparison of Passenger Revenues with Passenger Out-of-pocket Costs

Territory (1)	Operating revenues of passenger and allied services 1/ (2)	Out-of-pocket costs for passenger and allied services 1/ (3)	Excess or deficit as related to out-of-pocket cost (4)
New England Region	$49,938,765	$41,680,250	$8,258,515
Eastern District excluding New England Region	275,285,818	263,272,452	12,012,366
Eastern District including New England Region	325,223,583	304,952,702	20,270,881
Pocahontas Region	12,616,785	16,144,080	d 3,527,295
Southern Region	74,919,813	77,851,242	d 2,931,429
Western District	219,275,727	242,425,763	d 23,150,036
United States	632,035,908	641,373,787	d 9,337,879

As stated hereinabove, the out-of-pocket deficit thus developed is an economic burden upon the freight traffic. 2/ Based on the figures shown in Table 14, column (4), the deficit constitutes 2 percent or less of the carload revenues for the Pocahontas, Southern and Western Regions and about 0.3 percent of the carload revenues for the United States as a whole.

---

d Deficit

1/ The district data as to revenues and expenses were compiled from Statistics of Railways in the United States, 1939, Tables 113-A and 86, respectively, and the Bureau of Statistics work sheets used in compiling the above-mentioned publication. Payroll taxes by territories were taken from the monthly reports of revenues and expenses, Statement M-100.

2/ See Chapter I, page 4.

Compensatory character of the carload rate structure:

The compensatory character of the carload rate structure by territories may be tested by comparing the carload revenues with one or more levels of carload operating expenses. For purposes herein, the comparisons are made with Carload Cost Levels I, IV, and V(b). These carload cost levels (or levels of revenue needs) were selected as being the most significant for the purpose.

Table 15 provides a comparison based, insofar as possible, on the territorial grouping used for this study. Where a railroad was assigned to more than one territory, the carload revenues were apportioned between the territories on the basis of the separation of the carload operating expenses, rents and taxes. 1/

Table 16 provides a similar comparison with the exception that each carrier is assigned solely to one territory. 2/ The out-of-pocket costs, Cost Level I, were computed by taking 80 percent of Cost Level II. See Chapter V for treatment of out-of-pocket costs.

1/ See Table 9, footnote 1, for list of railroads assigned to more than one territory.

2/ See Table 10, footnote 1, for assignment of railroads to territories.

Table 15. Comparison of Carload Revenues with Several Levels of Carload Cost Based on Territorial Grouping Used for This Study

Territory	Carload revenues 1/	Cost Level I, out-of-pocket costs		Cost Level IV, includes less-carload and passenger operating deficits but excludes return		Cost Level V(b) includes less-carload and passenger operating deficits and a return at 5½%	
		Expenses	Relation of revenues to expenses	Expenses	Relation of revenues to expenses	Expenses	Relation of rev. enues to expenses
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
New England	$105,884,095	$58,035,698	182.4%	$85,047,622	124.5%	$134,992,259	78.4%
Eastern, excl. New England and northern Illinois	1,226,727,770	689,988,733	177.8	977,943,747	125.4	1,378,831,467	89.0
Total Eastern, incl. New England but excl. northern Illinois	1,332,611,865	748,024,431	178.2	1,062,991,369	125.4	1,513,823,726	88.0
Pocahontas	214,698,415	101,511,749	211.5	138,690,406	154.8	186,376,069	115.2
Southern	355,079,647	190,067,707	186.8	275,746,070	128.8	391,573,297	90.7

United States	3,123,589,475	1,722,780,897	181.3	2,512,943,862	124.3	3,547,693,993	88.0

1/ Carload revenues by territories taken from the Freight Commodity Statistics, Statement 40100, Table 3, Commodity Class 850. "Freight revenue" means the reporting carrier's gross freight revenue without adjustments for absorptions or corrections, except as to those carriers which report their freight revenue on a net basis in the Freight Commodity Statistics. Inclusion of the gross freight revenue without adjustments for the absorption of the switching charges of other Class I carriers in the same territory will not affect the comparison shown as the territorial gross revenues are compared with the total territorial expenses. The remaining absorptions covering services the expenses for which are not included in the costs shown in the table may result in an overstatement of the revenues of from 1 to 3 percent in the several territories and an overstatement of something less than 2 percent for the United States as a whole.

Table 16. Comparison of Carload Revenues with Carload Costs Based on the Assignment of Each Carrier to a Single Territory

Territory (1)	Carload revenues 1/ (2)	Cost Level I, out-of-pocket costs		Cost Level IV, includes less-carload and passenger operating deficits but excludes return		Cost Level V(b) includes less-carload and passenger operating deficits and a return at 5¾%	
		Expenses (3)	Relation of revenues to expenses (4)	Expenses (5)	Relation of revenues to expenses (6)	Expenses (7)	Relation of revenues to expenses (8)
New England	$97,568,518	$53,096,015	183.8%	$78,089,278	124.9%	$122,288,147	79.8%
Eastern, excl. New England and northern Illinois	1,204,436,327	679,039,923	177.4	962,704,852	125.1	1,362,320,570	88.4
Total Eastern, incl. New England but excl. northern Illinois	1,302,004,845	732,135,938	177.8	1,040,794,130	125.1	1,484,608,717	87.7
Pocahontas	214,698,415	101,511,749	211.5	138,690,406	154.8	186,376,069	115.2
Southern	404,261,822	216,905,887	186.4	312,576,446	129.3	444,097,628	91.0
Total Western	1,202,624,393	672,227,323	178.9	1,020,882,880	117.8	1,432,611,579	83.9
United States	3,123,589,475	1,722,780,897	181.3	2,512,943,862	124.3	3,547,693,993	88.0

1/ Carload revenues by territories taken from the Freight Commodity Statistics, Statement 40100, Table 3, Commodity Class 850. "Freight revenue" means the reporting carrier's gross freight revenue without adjustments for absorptions or corrections, except as to those carriers which report their freight revenue on a net basis in the Freight Commodity Statistics. Inclusion of the gross freight revenue without adjustments for the absorption of the switching charges of other Class I carriers in the same territory will not affect the comparison shown as the territorial gross revenues are compared with the total territorial expenses. The remaining absorptions covering services the expenses for which are not included in the costs shown in the table may result in an overstatement of the revenues of from 1 to 3 percent in the several territories and an overstatement of something less than 2 percent for the United States as a whole.

An analysis of Tables 15 and 16 indicates that the carload revenues for the United States approximate 181 percent of the out-of-pocket costs of handling carload traffic, 124 percent of the carload operating expenses, rents and taxes increased for less-carload and passenger deficits, and 88 percent of those revenues necessary to cover all expenses, and, in addition, provide a return of $5\frac{3}{4}$ percent upon the total property valuation. These percentages vary somewhat by territories. It will be noted that the carload revenues on the average should practically double the out-of-pocket expenses shown if the carriers were to earn a $5\frac{3}{4}$ percent return. However, as Tables 15 and 16 indicate, the carload revenues, except in the Pocahontas Territory, are insufficient to yield this rate of return. The rate realized in 1939 from all traffic, including passenger-train traffic, is shown by territories in Table 17 below. The return is based upon the recommended rate-making values furnished by the Bureau of Valuation for the purpose of this study.

Table 17. Rate of Return for Class I Carriers by Territories - 1939. Includes All Services 1/

Territory	Percent
New England	2.48
Eastern excluding New England and northern Illinois	3.36
Eastern excluding New England but including northern Illinois	3.22
Total Eastern, including New England and northern Illinois	3.15
Pocahontas	9.29
Southern	3.50
Southwestern including southern Missouri	2.46
Western Trunk Line excluding northern Illinois and southern Missouri	2.42
Western Trunk Line including northern Illinois but excluding southern Missouri	2.31
Mountain Pacific	2.71
Total Western, including Southwestern, Western Trunk Line and Mountain Pacific	2.47
Total United States	3.24

1/ See Cost Scales, Table 87, column (75).

CHAPTER IV

Procedure Used in the Computation of Costs

Cost formula:

For the purpose of this study, a cost formula designated as Rail - Form A was developed and applied to each railroad individually, or to each portion of a railroad where it was assigned to more than one territory. The formula provided for the following: [1]

1. The freight maintenance of equipment and rental expenses were separated first, between classes of equipment and secondly, between running, switching and station services as follows:

   (a) The expenses for steam and other locomotives were separated between road and yard.

   (b) The freight-train car expenses were separated between those cars rented on a "mileage basis" and "all other cars".

   (c) The freight-train car expenses for "all other cars" were separated between the mileage and time portions of such expenses.

      (1) The mileage portion of this expense was next separated between the running service and the switching service on the basis of the equated car-miles in each service. [2] The switching portion thus obtained was separated on an equated car-handled basis between (a) origin and destination switching [3] and (b) that switching which is includible in the running service, i.e., interchange switching, intermediate switching, and intertrain and intratrain switching.

---

[1] The formula applied to each railroad consisted of 8 schedules (21 pages). The territorial summaries consisted of 4 schedules (12 pages).

[2] See Appendix A for explanation of switching, car-mile and car-day factors.

[3] Includes carrier terminal switching and connection terminal switching. See Appendix B for definition of the classes of switching.

(2) The time portion of such freight-train car expense was separated between running and switching on an active car-day basis. 1/ The switching portion thus obtained was separated on an active car-day basis between (a) origin and destination switching 2/ and (b) that switching which is includible in the running service, i.e., interchange switching, intermediate switching, and intertrain and intratrain switching.

(d) Where a carrier's operations were assigned to more than one territory, the following additional steps were taken:

(1) Where the data were available, the locomotive repairs were separated between territories on the basis of the repair expenses by classes of locomotives and the mileage run by each class in each territory. Locomotive depreciation, retirements and rents were separated on a locomotive ton-mile basis.

(2) Where the carrier could not supply the data by classes of locomotives, 40 percent of the road locomotive expenses for repairs, depreciation, retirements and rents were separated on a locomotive-mile basis and 60 percent were separated on a locomotive ton-mile basis. 3/ The corresponding expenses for yard locomotives were separated on a yard engine-hour basis.

1/ See Appendix A for explanation of switching, car-mile and car-day factors.

2/ Includes carrier terminal switching and connection terminal switching. See Appendix B for definition of the classes of switching.

3/ Based on (a) study by the Engineering Section, Bureau of Valuation, and (b) study by the California Railroad Commission, in Case 4402, Ex. 2, pages 182-186. These studies indicate (a) that 50 percent of the locomotive repair costs per mile are proportional to the weight of the locomotive, (b) that the remaining 50 percent are independent of the weight of the locomotive, and (c) that the retirements and depreciation per locomotive-mile are 100 percent proportional to the locomotive weight. These factors when applied to the repairs, retirements and depreciation of all Class I carriers resulted in the factors indicated (to nearest even five percent).

(3) Freight-train car expenses, running portion, were separated on the basis of the equated car-miles in each territory.

(4) Freight-train car expenses, time portion, were separated on the basis of the active car-days in each territory.

The necessary data as to car-miles were supplied by the carriers in answer to a questionnaire dated November 19, 1940.

2. The freight expenses for maintenance of way and structures and transportation were separated between running service, switching service, station service, special services and general overhead. Where a railroad's operations were assigned to more than one territory, the carrier was requested to furnish a breakdown of its maintenance of way and transportation expenses by territories. (See questionnaire dated November 23, 1939.)

3. The passenger portion of the cost of transporting nonrevenue freight in freight trains was computed and assigned to the passenger service.

4. The items of expense were grouped and the total of the expenses for each group was distributed to the traffic movements on the basis of the service units with which the expenses were functionally related.

The expenses chargeable to the carload traffic were distributed on the basis of the service units listed below:

Service Units Used for Carload Traffic

Expense group (1)	Service unit (2)
I. Freight-train car maintenance and rental expenses for "Other than mileage" cars in running service. (Revenue cars only)	Revenue car-miles "other than mileage" cars (excluding nonrevenue and caboose car-miles. 1/
II. Miscellaneous running expenses common to all cars, distributable on a car-mile basis (includes expense for interchange, intertrain and intratrain switching).	Revenue car-miles, including "mileage cars".
III. Remaining running expense.	Revenue gross ton-miles of cars and contents (excluding cabooses)
IV. Switching expenses for carrier or connection terminal switching at point of origin or destination, industry and team tracks.	Revenue carloads originated or terminated.
VI. Freight-train car maintenance and rental expenses for "other than mileage" cars, account carrier or connection terminal switching, plus detention for loading and unloading.	Revenue carloads originated or terminated.
VIII. Carload station expenses.	Revenue carloads originated or terminated, (i.e., consignments)

1/ Mileage cars mean cars rented on a mileage basis, principally tank and refrigerator cars. All other cars are designated as "other than mileage" cars. Where costs are computed for mileage cars, the car hire of 1.5 cents or 2.0 cents per mile replaces the Group I and Group VI expenses.

The expenses chargeable to the less-carload traffic were distributed on the basis of the following service units:

Service Units Used for Less-Carload Traffic

	Expense group (1)	Service unit (2)
I.	Same as for carload.	-
II.	Same as for carload.	-
III.	Same as for carload.	-
IV.	Switching expenses for carrier or connection terminal switching at point of origin or destination, freighthouse tracks.	Less-carload loaded cars originated or terminated.
V.	Switching expenses for carrier or connection terminal switching at less-carload transfer points.	Less-carload loaded car-miles.
VI.	Freight-train car maintenance and rental expenses for "other than mileage" cars account carrier or connection terminal switching plus detention for loading or unloading, at origin or destination point.	Less-carload loaded cars.
VII.	Freight-train car maintenance and rental expenses for "other than mileage" cars account carrier or connection terminal switching plus detention for loading or unloading at transfer points.	Less-carload loaded car-miles.
VIII.	Less-carload station expenses, other than platform.	Less-carload tons originated plus the tons terminated.
IX.	Less-carload station platform expenses, origin or destination handling.	Less-carload tons originated plus the tons terminated.
X.	Less-carload station platform expenses account transfer.	Less-carload net ton-miles.

5. The weighted average unit costs by territories were obtained by summarizing the expenses and service units by territories and dividing the aggregate expenses by the aggregate units. 1/

6. For the purpose of computing the cost scales the unit costs were further reduced to (a) a cost per 100 pounds for those expenses which are independent of the length of haul, and (b) a cost per 100 pounds per mile for those expenses variable with the length of haul. Such unit costs were computed separately for each size of net load appearing in the cost scales. For purposes of illustration the assembly of these unit costs for Territory No. 12, the United States, (box car and less-carload traffic) is shown in the Cost Scales, Tables 88 and 89.

The carload expenses treated as variable with the length of haul include expense groups I, II, and III. The carload expenses treated as independent of distance include expense groups IV, VI, and VIII. The less-carload expenses treated as variable with the length of haul include expense groups I, II, III, V, VII, and X. The less-carload expenses treated as independent of distance include expense groups IV, VI, VIII, and IX.

7. The less-carload operating deficits were computed by subtracting the less-carload revenues from the total of the less-carload station costs, line-haul costs, switching costs, and the payments to others for pick-up and delivery. The data were compiled by individual railroads.

The less-carload line-haul costs were determined by multiplying the gross ton-miles and car-miles produced in the transportation of less-carload traffic by the unit cost per gross ton-mile and per car-mile, respectively. The necessary data as to the average haul per ton originated and received from connections and the average net ton-miles per loaded car-mile were obtained from Senate Resolution 146, 76th Congress, First Session, Vol. 1, Statement 6. In computing the gross ton-miles it was assumed that less-carload traffic was handled in box cars having the same ratio of empty car-miles to loaded car-miles as obtained for all box car equipment.

Where a railroad was assigned to more than one territory, the system ton-miles and car-miles of less-carload traffic were apportioned to each territory upon the basis of the total tons

---

1/ See Cost Scales, Table 87.

handled in each territory 1/ (i.e., less-carload tons originated and received from connections). Where a railroad was assigned to more than one territory, the system less-carload operating deficit was apportioned to each territory on the basis of the carload operating expenses incurred in each territory. The effect of this was to treat the deficit as a burden on the system as a whole no matter where incurred. For example, if the system less-carload deficit amounted to five percent of the system carload operating expenses, the carload costs, including allowance for the less-carload deficit, were obtained by adding five percent to the carload expense in each territory.

The less-carload deficit computed as explained above does not include any allowance for a return on the value of the property used in the less-carload service. To provide for a return upon value each railroad's valuation was separated between freight and passenger and the freight portion again separated between carload and less-carload on the basis of the operating expenses. The justification for this basis of separation is that the operating expenses are roughly proportional to the units required in the performance of each service, i.e., gross ton-miles in running service, engine minutes in switching service, etc., and that such units constitute a measure of the use made by each service of the transportation facilities of the carrier. The results may be considered as approximate only. 2/

1/ As the average length of haul for less-carload traffic varies between territories this treatment may result in an overstatement or understatement of the territorial running expenses for the railroads involved. The error is eliminated in the larger territorial groupings (i.e., total of Western Territories) which avoid, except to an insignificant degree, the territorial separation of an individual carrier's operations.

2/ The point may be raised that under the existing less-carload and passenger rate structures the separation of the value of the property between freight and passenger and the further separation of the freight portion between carload and less-carload is more or less of academic interest only inasmuch as the passenger service and less-carload service fail to cover their full operating expenses, rents and taxes, to say nothing of providing for a return on the value of the property. On the other hand, the separation made herein does serve to provide an indication of the approximate level of the less-carload rates if this traffic were to earn a return.

8. The passenger operating deficits were computed by subtracting the passenger service revenues from the passenger service operating expenses. Where a railroad was assigned to more than one territory, the passenger operating deficit was apportioned to each territory on a basis similar to that explained above for the less-carload deficits.

9. The value of the road and equipment for each railroad was furnished by the Bureau of Valuation as of December 31, 1939. Where a railroad was assigned to more than one territory, the Bureau of Valuation furnished the value of the road (aggregate of accounts 1 to 47, inclusive) separated by territories. In such cases, the Bureau also furnished a separation of the system value of the equipment by individual accounts (accounts 51 to 58, inclusive). The allowance for general expenditures, accounts 71 to 77, inclusive, was distributed over the road and equipment accounts.

The Bureau of Statistics separated the value of the equipment between territories on the basis of appropriate factors. For example, the value of locomotives was first separated between road and yard on a tonnage basis, giving a weight of 1.2 to a ton of road engines and a weight of 1.0 to a ton of yard engines. 1/ The value of the yard locomotives was next separated between freight and passenger on the basis of the system yard locomotive-miles in each service. The value thus apportioned to the freight service was then separated between territories on the basis of the yard locomotive-miles. The same procedure was followed for the passenger portion of the value. The system value for road locomotives was separated between freight and passenger on the basis of the ton-miles of locomotives and tenders operated in each service. The freight portion was then distributed between territories on the basis of the ton-miles of locomotives and tenders in freight service. The passenger portion was separated between territories on the basis of the passenger locomotive-miles, the locomotive ton-miles not having been obtained from the carriers. The value of the freight-train cars was separated between territories on the basis of active car-days. The value of the passenger-train cars was separated between territories on the basis of the passenger-train car-miles. The value of floating equipment was separated between territories on the basis of the distribution of the maintenance and transportation expenses for such equipment.

1/ Weighting furnished by Engineering Section, Bureau of Valuation. Added weight given road locomotives based on special appliances used on road engines which are not found on yard engines.

10. The return on value was computed at both 4 percent and 5¾ percent. The figure of 4 percent was used in addition to the figure of 5¾ percent for the purpose of showing costs based on a rate of return which more nearly approximates that currently being earned by the railroads than does the figure of 5¾ percent. In 1939 the rate of return for all Class I railroads was 3.24 percent based on the recommended rate-making value furnished by the Bureau of Valuation for the purpose of the present cost study.

11. The expenses for the operation of grain elevators and storage warehouses plus the overhead expenses and the rate-making value apportionable thereto on an operating expense basis, were excluded from consideration in developing the cost scales. These items were included, however, in computing the rate of return currently earned by the carrier from all its services.

12. Cost scales were computed for the traffic moving in the following six types of freight cars:

Box,
Flat,
Stock,
Gondola and hopper,
Tank,
Refrigerator.

The differences in cost by types of railroad-owned equipment were occasioned, under the formula, solely by the differences in the tare weight and the return empty movement characterizing each type of equipment. 1/ However, in the case of tank cars and refrigerator cars, the railroads' freight-train car expenses (Groups I and VI) were eliminated and in lieu thereof was substituted the car hire of 1.5 cents per car-mile in the case of tank cars and 2.0 cents in the case of refrigerator cars. In 1939, only 5.6 percent of the tank cars and 15.1 percent of the refrigerator cars were railroad owned. 2/

The tare weights by classes of equipment were taken from the replies to a questionnaire issued to the carriers. A territorial average for each type of equipment was obtained by weighting the figure reported by each railroad with the total number of carloads the reporting railroad hauled of the traffic

---

1/ See Appendix B hereto for the territorial average tare weights and percent return empty of equipment.
2/ From Statistics of Railways in United States, 1939, pages 21 and 23.

customarily handled in each type of equipment. 1/ The tare weights for tank cars and refrigerator cars were based upon the average for railroad-owned equipment. As most of this equipment is privately owned, the average tare weight found for the United States was used in each territory for the purpose of computing the cost scales.

The same procedure was followed in obtaining the territorial weighted average ratio of empty car-miles to loaded car-miles by types of equipment.

Where a railroad's operations were assigned to more than one territory, the system average was used for each territory weighted in proportion to the percentage of the total cars that were originated or received from connections on the separate territories. No attempt was made to include in the figures for the Eastern Territory the tare weight or the percent return empty experienced in the operations of the Western Trunk Line railroads in northern Illinois. The inclusion of the latter operations with Eastern Territory would have a negligible effect on the average tare weight and percent return empty shown for the East.

While the figures shown in the cost scales are based upon the weighted average tare weights and weighted average ratios of empty car-miles to loaded car-miles by territories, one can compute a cost scale based on different tare weights or different ratios of empty to loaded car-miles by referring to the territorial unit costs (Cost Scales, Table 87) and following the procedure shown in the assembly schedule (Cost Scales, Tables 88 and 89.

13. The cost scales developed show only Cost Level II, i.e., the operating expenses, rents and taxes. Cost Levels III, IV, and V have been computed as a percentage of Cost Level II. Because of the expense, no attempt was made to set up scales for all the levels of cost. The figures for Cost Levels III, IV, and V are obtained by multiplying the figure shown in the Cost Scales by the appropriate factor (ratio) shown in the footnotes thereto. The loss and damage expense per 100 pounds applicable to the commodity under study should subsequently be added. This is found in Table No. 85. The loss and damage expense is the same for each level of cost.

The ratios used in computing Cost Levels III, IV(a), IV(b), V(a), and V(b) were mathematically derived as an integral

---

1/ The commodity classes assumed to move in each type of car are set forth in Appendix C.

part of the rail cost formula - Form A. On the other hand, Cost Level I, out-of-pocket cost, is based on certain assumptions which necessarily result in this level of cost being subject to some degree of approximation. For this reason the ratio by which Cost Level II should be multiplied to obtain Cost Level I has been omitted from the cost scales. See Chapter V for treatment of out-of-pocket costs.

Source of the data used in development of cost:

As previously indicated, most of the basic data used in applying the formula to those railroads assigned wholly to one territory were secured from the annual reports filed with the Commission for the year 1939. The following supplementary data not obtainable from the annual reports were secured from questionnaires sent to the carriers. The questionnaire issued under date of November 19, 1940, requested that the following data be furnished within two weeks:

(1) The car-miles for cars rented on a mileage basis,

(2) A separation of station employees, account 373, between platform labor and other employees (to be approximated if not actually known),

(3) An estimated percentage distribution (to nearest 10 percent) of nonrevenue freight net ton-miles by the classes of equipment shown:

Box cars,
Gondola and hopper cars,
Tank cars,
All other cars.

(4) Estimated average tare weight of cabooses,

(5) Estimated ratio of the empty car-miles to loaded car-miles, and the average tare weight for the following classes of equipment:

Box,
Flat,
Stock,
Gondola and hopper,
Tank and
Refrigerator.

(6) Statement of the freight loss and damage expenses, separated between those groups of commodities reported to the Freight Claim Division of the Association of American Railroads.

(7) Estimated average weight of less-carload shipments (answers could be based on special study made for the Association of American Railroads for period of September 8 to 14, 1939).

Under date of November 23, 1940, an additional questionnaire was issued to those railroads whose operations were assigned to more than one territory, requesting by December 10 the separation of the carrier's statistics and operating expenses by territories. A third questionnaire sent to these same railroads under date of March 12, 1941, requested a territorial separation of certain passenger statistics.

Adjustments made because of the limitations of the source material:

For the purpose of expediting this study not only were time limits placed upon the return of the questionnaires, but the requests themselves were limited to data which would not require time consuming studies by the carriers. With but few exceptions, the railroads cooperated fully to the extent that the time permitted. Where the data received was at any substantial variance with the returns from other carriers having like operating conditions, inquiry was made of the carrier and the necessary correction made. Not all problems could be solved in this manner however. The procedure followed under various circumstances are set forth below.

Separation of carrier operating expenses and statistics by territories:

Four railroads, the Great Northern, The Atchison, Topeka and Santa Fe, The Chicago, Rock Island and Pacific, and the Missouri Pacific reported that they could furnish a territorial separation of their operating expenses and statistics as requested by the Bureau of Statistics with the exception of the count of the carloads and of the less-carload tonnage. This count was maintained by the carriers on a basis different from the usual division breakdown. Usually it is kept by states. For example, the Northern Pacific, while furnishing the requested separation of its operating expenses and statistics for its lines east and west of Mandan, North Dakota, 1/ was unable to separate its count of cars and tons except by states. Mandan is 175 miles east of the Montana-North Dakota State line which is the boundary between the Western Trunk Line

---

1/ Mandan is the nearest division point to the boundary between the Mountain Pacific and Western Trunk Line Territories that could be used for the purpose of the territorial separation of expenses and statistics.

and Mountain Pacific Territories. To provide an approximate adjustment for this difference in the area represented by the operating expenses and that represented by the car count the following steps were taken. The percentage relation of the road mileage between Mandan and the state line to the total road mileage in North Dakota was computed (6.626 percent). This percent of the North Dakota carloads and less-carload tonnage was then deducted from the Western Trunk total and added to that for the Mountain Pacific Territory. The terminal costs (station and switching) were the only items affected as the line-haul traffic units, i.e., ton-miles and car-miles, were available on the basis desired. A similar procedure was followed with The Atchison, Topeka and Santa Fe, The Chicago, Rock Island and Pacific, and the Missouri Pacific.

In certain other cases the carriers' returns to the questionnaires, while providing a territorial separation of the carload and less-carload tons, failed to provide the supplementary data covering carloads and tons received and delivered in interchange. In such case the system total for carloads and less-carload tons received and delivered in interchange was separated between territories on the basis of the carloads and less-carload tons originated and terminated by territories. This adjustment was necessary in connection with the data provided by the Missouri Pacific, the St. Louis-San Francisco, the Great Northern, and the Northern Pacific.

The Atchison, Topeka and Santa Fe and the Northern Pacific did not provide a territorial separation of the car-miles for cars rented on a mileage basis. An arbitrary separation was made by the Bureau of Statistics based upon the total car-miles operated in each territory.

The Union Pacific Railroad reported that it did not currently separate its operating expenses by territories. This carrier was therefore requested to provide a separation of its statistics for the operations east and west of Cheyenne, Wyoming. 1/ Maintenance

---

1/ The statistics for which a separation was requested were the following:
(1) Miles of track separated between
    First main track,
    Second main track,
    Branch lines, and
    Switching tracks,
(2) Locomotive-miles,
(3) Locomotive ton-miles,
(4) Train-miles,
(5) Train-hours,
(6) Yard switching engine-hours,
(7) Car-miles:
    Loaded,
    Empty, and
    Total
(8) Caboose-miles
(9) Gross ton-miles (cars, contents, and cabooses)

of way expenses were then separated on the basis of equated track-miles, observing the weighting developed by a committee of the American Railway Engineering Association. 1/. The system maintenance of equipment expenses were next separated for the lines east and west of Cheyenne on the basis of locomotive-miles or locomotive ton-miles, yard engine hours, or car-miles, as appropriate; yard expenses were separated on a yard engine-hour basis; locomotive crew expenses were separated on a locomotive-mile basis; train crew expenses were separated on a train-mile basis; and fuel expenses were separated on a gross ton-mile basis. After all separations were made, it was found that 39 percent of the aggregate expenses had been apportioned to lines east of Cheyenne and 61 percent to lines west of Cheyenne. The rail cost formula, Form A, was next applied to the system expenses of the Union Pacific, and the expenses by groups obtained as explained hereinabove. Thirty-nine percent of all the expenses and a like percent of all the service units were then apportioned to the Western Trunk Line Territory and the balance to the Mountain Pacific Territory. The result was an approximate separation of the Union Pacific expenses between the two territories, at the same time maintaining in each territory the system average unit costs. While this method would not reflect any differences in Union Pacific unit costs between the two territories, it nevertheless avoided the greater error of throwing the entire Union Pacific operations solely into one territory.

Comments on territorial separations:

With a few exceptions most of the territorial separations involved the railroads in the three Western territories. For this reason, among others, the costs were developed for the Western Territory as a whole thus eliminating or reducing to negligible proportions any errors resulting from the territorial separation of a carrier's operations. As pointed out in Chapter III, the differences between the costs found for the individual territories and those for the Western Territory as a whole are small.

Separation of station expenses (account 373) between platform labor and other employees:

The following carriers stated they were unable in the time allowed to provide a separation of account 373, station employees, between platform labor and other employees:

New England:
  New York Connecting R. R.
  Rutland R. R.

1/ See A.R.E.A., Volume 24 (1923), pages 1092-1093.

Eastern:
  New York Central R. R.
  Monongahela R. R.
  Pittsburgh and Lake Erie R. R.
Pocahontas:
  Chesapeake & Ohio Ry. Co.
Southwestern:
  Atchison, Topeka and Santa Fe Ry.
  St. Louis-San Francisco Ry. Co.
Western Trunk Line and Mountain Pacific:
  Northern Pacific
  Great Northern

In such instances the Bureau of Statistics estimated the platform expense by including in platform labor all the employees' compensation appearing in the annual report, schedule 561, divisions 88 to 92, and 94. The amount so derived was subtracted from the total of account 373 (freight), leaving a remainder which was designated as "other employees." Where the operations of any of the above railroads were assigned to more than one territory, the system expenses separated as above between "platform labor" and "other employees" were again separated between territories on the basis of the carrier's separation of the total of account 373.

Treatment of other errors arising from inadequate separation of station expense:

The separation made by some carriers, principally small railroads, between station platform labor and other employees resulted in costs per ton which were sharply at variance with the territorial average for the remaining carriers. The arbitrary rule was adopted that where the platform cost per ton, after an increase for transportation overheads 1/, was below $.40 or above $2.00 per ton, the territorial average cost computed for the remaining carriers in that territory would be applied to that road. Any increase or decrease in the cost was followed by an adjustment in the remaining station costs reported by the railroad. The total of the carrier's charges to account 373 remained unchanged. The railroads affected were as follows: 2/

1/ Includes station maintenance, station supplies and transportation overhead including superintendence, stationery, insurance, injuries, etc., accounts 371, 410-11, 414, 420.

2/ See Chapter VI hereto for the territorial average station platform costs per ton, labor only, computed from the study.

New England
- Bangor & Aroostook R. R.
- Central of Vermont Ry.
- International Railway of Maine

Eastern
- Delaware, Lackawanna & Western R. R.
- Detroit & Mackinac Ry.
- Lehigh Valley R. R.
- Long Island R. R.
- Montour R. R.
- Pennsylvania-Reading Seashore Lines
- Pittsburgh & West Virginia Ry.
- Toledo, Peoria & Western R. R.
- Wabash Railway
- Western Maryland Ry.

Southern
- Gulf & Ship Island R. R.
- Mississippi Central R. R.
- Northern Alabama Ry.

Southwestern
- Burlington-Rock Island R. R.
- Missouri & Arkansas Ry.
- Oklahoma City-Ada-Atoka Ry.
- St. Louis Southwestern Ry.
- Texas Mexican Ry.

Mountain Pacific
- Denver & Rio Grande Western R. R.
- Spokane International Ry.

The less-carload platform cost data for the Chicago, Milwaukee, St. Paul and Pacific were similarly adjusted inasmuch as the costs shown only slightly exceeded the minimum set forth above and were substantially out of line with those of other railroads in the Western Trunk Line Territory. In the case of three railroads whose operations were assigned to more than one territory, the platform costs per ton, while within the range above indicated when treated on a system basis, appeared distorted when divided by territories. The costs were adjusted to apply a system cost per ton in each territory. The railroads for which this adjustment was made were the Illinois Central, the Chicago Great Western, and the Louisville and Nashville. In making all of the above adjustments, no change was made in the aggregate of a carrier's charges to account 373.

The following railroads show no platform costs in their returns to the Bureau of Statistics questionnaire nor any charges to schedule 561, divisions 88 to 92 and 94. The studies, therefore, include no platform expenses for these carriers:

Louisiana, Arkansas and Texas
Missouri-Illinois R. R.
Monongahela Ry.
New York Connecting Railroad
Utah Ry.

See discussion in Chapter VI concerning the effect of the inadequacies in station expenses on the cost scales.

Pick-up and delivery payments:

Where a carrier performs its own pick-up and delivery service the expenses for equipment repairs, equipment depreciation and drivers' wages are charged to accounts 328, 331, and 411. As no segregation of the charges to these accounts was available, any expenses contained therein for pick-up and delivery are distributed over all traffic, carload and less-carload. The expenses involved however are negligible. The payments to others for pick-up and delivery service have been included in the study only for the purpose of computing the less-carload deficit and of comparing the less-carload out-of-pocket costs with the less-carload revenues. The less-carload cost scales therefore do not include any allowance for payments to others for pick-up and delivery.

Distribution of nonrevenue freight by classes of equipment:

A number of carriers were unable to provide the percentage distribution of their nonrevenue freight by classes of equipment. The purpose of such distribution was to permit of a more accurate computation of the tare ton-miles chargeable to the handling of nonrevenue freight than was obtainable by taking the ratio of the nonrevenue ton-miles to the revenue ton-miles. Where the carrier was unable to provide the desired percentage distribution, the average for five large representative roads in each territory was used. This procedure of using the data for five railroads made it possible to apply the cost formula to the railroads in question without waiting for all the returns for the territory to be received. This procedure was used for the following railroads:

New England Territory:
  Canadian National Lines in New England
  New York Connecting
Eastern Territory:
  Pennsylvania Railroad
  Long Island Railroad
  Pennsylvania-Reading Seashore Lines
  Monongahela Ry.

Southwestern Territory:
Texas and New Orleans R. R.
Gulf Coast Lines
Western Trunk Line and Mountain Pacific Territories:
Great Northern Ry.
Union Pacific R. R.

Table 18 gives the territorial average percentage distribution of nonrevenue freight by classes of equipment which was applied to the above-named carriers:

Table 18. Percentage Distribution of Nonrevenue Freight by Classes of Equipment

Territory	Box	Gondola and hopper	Tank	All other	Total
New England	6.7	72.7	1.0	19.6	100.0
Eastern	11.8	87.0	0.8	0.4	100.0
Southern	13.2	69.0	9.1	8.7	100.0
Southwestern	17.5	48.8	20.7	13.0	100.0
Western Trunk Line	14.7	70.3	7.3	7.7	100.0
Mountain Pacific	23.5	50.5	13.6	12.4	100.0

Computation of tare weight of equipment for purpose of computing nonrevenue gross ton-miles:

Certain railroads failed to provide the average tare weight of their equipment. For the purpose of computing the tare ton-miles produced in the hauling of nonrevenue freight, the tare weight was based upon that computed for five large representative roads in each territory. The explanation should here be made that for the purpose of computing the territorial average tare weight used in the development of the cost scales, the data for all reporting railroads in the territory were used. The railroads failing to report the tare weight of the equipment were as follows:

New England Territory:
Canadian National Lines in New England
New York Connecting R. R.
Eastern Territory:
Montour R. R.
Monongahela Ry.
Staten Island Rapid Transit

Southern Territory:
  Georgia & Florida R. R.
Western Trunk Line:
  Minneapolis and St. Louis R. R.
  Duluth South Shore and Atlantic Ry.
Southwestern:
  Gulf Coast Lines

Development of the ratio of empty to loaded car-miles:

A number of railroads stated they were unable in the time provided to furnish any estimate as to the ratio of the empty car-miles to loaded car-miles by classes of equipment. For the purpose of computing the nonrevenue gross ton-miles incurred in the movement of nonrevenue freight, a factor was applied to each railroad based upon a simple average of that for five large representative roads in the same territory. Any error involved in this procedure would insignificantly affect the cost study. For the purpose of computing the ratio of empty car-miles to loaded car-miles for use in the cost scales, a weighted average was used for all reporting carriers in each territory. The railroads failing to furnish the ratio of empty to loaded car-miles by classes of equipment were as follows:

New England Territory:
  Canadian National Lines in New England
  Rutland R. R.
Eastern Territory:
  Monongahela Ry.
  New York Central R. R.
  Pittsburgh & Lake Erie R. R.
Southwestern:
  Gulf Coast Lines
Western Trunk Line and Mountain Pacific:
  Minneapolis & St. Louis R. R.
  Northern Pacific Ry.
  Minneapolis, St. Paul and Sault Ste. Marie Ry.
  Chicago Great Western Ry.
  Great Northern Ry.
  Duluth, South Shore and Atlantic Ry.

Separation of loss and damage expenses by commodity groups:

The railroads listed below failed to provide a separation of loss and damage expenses by commodity groups. In such case their aggregate payments for loss and damage were distributed among the commodity groups in the proportion that the payments for all other reporting roads in the territory were distributed. The amounts involved were negligible.

Missouri-Illinois Railroad
Midland Valley R. R.
Canadian Pacific Lines in Vermont
International Railway of Maine

CHAPTER V

Computation of the Out-of-Pocket Costs

Description and analysis:

The out-of-pocket costs are those costs which would be added because of an increase in traffic or which would be eliminated because of a decrease in traffic. They are those expenses which are directly affected by use. By observing the effect of changes in the volume of the traffic on the expenses a measure of the out-of-pocket expenses can be obtained.

The percentage of the expenses affected by use may vary with the following factors, among other; first, the degree to which respondent's transportation facilities, or that portion of the facilities under study, i.e., running tracks, trains (scheduled speed considered), terminals, etc., are being operated at or near capacity; and secondly, the relative permanence of the assumed change in the volume of the traffic, i.e., whether of a short-term or of a long-term nature. The effect of these factors may vary not only between carriers but from period to period for an individual carrier. Under some circumstances added traffic may be handled without a proportionate increase in train-miles. Under other circumstances, the added traffic may occasion an increase in the train-miles which is relatively as great as the increase in traffic. Under certain circumstances added traffic may be handled without significantly affecting the investment, while under other circumstances it may occasion added investment.

The reason for the variation in the expences is that as the traffic increases by small increments it is continuously taxing the capacity of the existing railroad staff or facilities to handle it. Yard crews, yard clerks, station clerks, platform labor, train crews, engine crews, dispatchers, shop forces, enginehouse forces, rolling equipment, etc., are constantly added to meet the demands of increased traffic, and then reduced or withdrawn as the demand falls away. An analysis of the rise and fall of railroad traffic both on a seasonal and on an annual basis indicates that this process of change is ever present. Some items of expense, such as locomotive fuel, trainmen, enginemen and yard crews show a relatively high degree of response to changes in the volume of traffic. Other items such as superintendence, dispatching, station expenses, enginehouse expenses, and traffic and general expenses will increase and decrease in some measure as the traffic volume changes but the adjustment to the change in traffic is irregular. This is occasioned in part by the lag that may exist between the time the change in the volume of traffic occurs and the period when management can effect an adjustment of the expenses; and in part by the fact that any given size of staff can handle changes in traffic volume within a limited range, and as long as that range is not exceeded the expenses remain unaffected. When the change in the volume of the traffic exceeds the limits of this range, the expenses may rise or fall abruptly. A study of the expenses for Class I carriers incurred during various years and for periods of different traffic volume indicate that there are relatively few expenses which are not influenced in some degree by an increase or decrease in the traffic. The estimated degree to which each expense item is affected is shown in Table 19. The figures are based on the sources of information or assumptions there indicated.

The above discussion has dealt with the mass effect of increases or decreases in the traffic volume upon a carrier's expenses. Question may arise as to the out-of-pocket cost for handling a single additional carload. From the discussion that follows the conclusion is reached that on the average it is no different from that for mass changes in traffic volume.

Traffic conditions are never static on a railroad, the traffic volume being in a continuous state of flux. Furthermore, the changes in volume from month to month and year to year are seldom so limited in their range that the expenses remain unaffected. This condition being true, the effect of one added unit of traffic is no different from that of any other added unit. For example, if the receipt of 10 added tons of less-carload traffic occasions the employment of one added station platform trucker, one cannot place any more responsibility for this increased expense upon the tenth ton than upon the first ton. Each ton contributes equally in increasing the work up to that point which necessitated the additional employee. Furthermore, the fact that any one of the ten added tons might have been moving at rates based upon out-of-pocket costs would have no bearing on the need for the additional platform trucker. Similarly, if the receipt of ten added carloads requiring industry switching required the assignment of an additional yard engine crew, each one of these ten carloads is equally responsible for building up the work to a point where such added crew was necessary. Again, the fact that one of the ten added carloads might have been moving at rates based on out-of-pocket costs would have no bearing upon the need for the additional yard crew. The responsibility for the change in the expenses must be shared equally by each increment of traffic that contributed to the increase or decrease in the expenses.

Assumptions made in computing out-of-pocket costs:

The percentage of the expenses set forth below as affected by use represents neither the lowest nor the highest out-of-pocket costs which might obtain under various possible combinations of circumstances.1/ They are based on the following assumptions:

(a) That, for the purpose of computing the maintenance of way expenses, the traffic under study moves over routes of average traffic density. (The percentage of expenses affected by use on branch lines will normally be lower than that for main lines which enjoy a heavier traffic density.)

(b) That, for the purpose of computing the maintenance of equipment expenses, the investment in locomotive equipment and freight-train cars, and the rental of such equipment, will adjust itself, with some lag, to the volume of traffic handled by respondent,2/ and

(c) That the yard engine hours and the train-miles are directly proportional to changes in the volume of traffic.

1/ See appendix D.

2/ Maintenance of equipment expenditures fluctuate widely. In times of relative prosperity the needs of the traffic require that the equipment awaiting repairs be reduced to a minimum. As traffic drops off the need for equipment correspondingly declines and under the pressure of declining revenues the cars and locomotives needing repairs may be stored rather than sent to the shops. This procedure may continue temporarily until the supply of serviceable equipment is reduced to the current needs of traffic. A new but lower level of shop expenditures is then reached which is in tune with the then-existing flow of traffic. When traffic is declining the carrier may be temporarily living on its "fat," i.e., on the excess of serviceable equipment above current needs. When traffic picks up and unserviceable equipment is taken out of storage for repairs the process is reversed with a temporary added financial burden to the carrier. A like situation exists as to the ownership of equipment. As traffic declines purchases fall off and as traffic picks up purchases increase. Although this adjustment of ownership to traffic needs is very irregular and subject to much lag, particularly when traffic is declining, and although the long time trend is influenced by the continuous drive toward more effective utilization of equipment, nevertheless there exists the basic tendency for management to adjust its ownership of equipment to its traffic needs (allowance for reserves included).

Procedure in computing out-of-pocket expenses:

The percentage of the costs which may be considered as out-of-pocket under the above assumptions was computed for carload and less-carload traffic for various lengths of haul by applying the rail cost formula used in this study, Form A, first, to the full costs, and secondly, to the out-of-pocket portion of the aggregate expenses for all Class I railroads treated as a group.1/ The procedure of applying the formula to each railroad individually as was done in computing the cost scales was not followed in this case.

For purposes herein, the portion of the charges to each account treated as the out-of-pocket expense is as shown in Table 19.

1/ The source of the data (1939) was as follows:

Operating expenses from Preliminary Abstract of Statistics of Railways, Summary No. 4 (1939). Data as to locomotive-miles, ton-miles, car-miles and train-miles from Text of the 53rd Annual Report on the Statistics of Railways in the United States (1939), Table 158, pages 166-168, and questionnaires issued in connection with this study. Rents, taxes, and car hire taken from 53rd Annual Report on the Statistics of Railways in the United States (1939), Table 107, page 93; Table 113-A, page 99; and table 115, page 101. Less-carload data concerning estimated average weight of less-carload shipments, average net ton-miles per loaded car-mile, average haul per ton, obtained from returns to questionnaires and material appearing in Senate Resolution 146, 76th Congress, 1st Session, Volume I, Statement 6.

Joint facility rents (Accts. 508 and 541 - Net)	0	1/
Rent of buildings and other property (Account 142 - Credit)	0	1/
Payroll taxes	3/	
All other taxes - freight portion	4/	

1/ Percentage based on estimate.

2/ See data and references in appendix D.

3/ Computed by multiplying the freight portion of the payroll taxes by the ratio of the out-of-pocket expenses, excluding equipment depreciation, to the total operating expenses, excluding equipment depreciation.

4/ Includes Federal income taxes and freight portion of Federal telephone and telegraph, gas and oil, and electrical energy taxes.

Out-of-pocket portion of the aggregate carload and less-carload expenses:

The results of the study made by applying the formula first to the full costs and secondly to the out-of-pocket costs are shown in Table 20.

Table 20. Comparison of Carload and Less-Carload
Out-of-Pocket Costs, Cost Level I, with
Total Operating Expenses, Rents and
Taxes, Cost Level II 1/

Expense item (1)	Out-of-pocket costs Cost Level I (2)	Operating expenses, rents and taxes, Cost Level II (3)	Ratio of out-of-pocket costs to total operating expenses, rents and taxes (4)
Carload operating expenses rents and taxes	$1,534,628,295	$2,145,183,774 2/	73.8%
Less-carload cost including running, switching and station expenses but excluding payments to others for pick-up and delivery	206,203,985	302,351,309	68.3%

As indicated in the above table, the out-of-pocket portion of the carload operating expenses, rents and taxes constitutes, under the assumptions set forth hereinabove, 73.8 percent of the total of such expenses. The comparable percentage for the less-carload traffic is 68.3 percent. The lower percentage for the less-carload traffic is attributable to the relatively small portion of the station expenses, other than platform labor, assumed to be variable with changes in traffic volume (33 percent). This expense constitutes a higher portion of the total expenses in the case of less-carload traffic than it does in the case of carload traffic.

1/ Excludes payments to others for pick-up and delivery.

2/ This figure differs by 0.39 percent from the total of $2,153,476,121 appearing in the Cost Scales, Table 87, column 42. The latter figure was obtained by applying the formula to each railroad individually.

The percentage that the out-of-pocket cost constitutes of the full cost will vary according to the length of haul and the net weight of the shipment. Table 21 shows the relationship of the carload out-of-pocket costs to the full costs for various lengths of haul and net loads based on traffic moving in box cars.

Table 21
Percent That the Carload Out-of-Pocket Costs (Cost Level I) Constitute of the Carload Operating Expenses, Rents and Taxes (Cost Level II)

Miles	5 Tons	25 Tons	50 Tons
0	69.5	69.6	69.5
50	70.6	70.6	70.4
100	71.7	71.4	71.4
200	72.7	72.4	72.5
300	73.1	73.0	73.1

1,000	71.0
1,500	72.4
3,000	74.0

1/ The average haul per less-carload ton originated is 515 miles. Senate Resolution 146, 76th Congress First Session, Statement No. 6, page 15. Based on test study during week ended, October 7, 1939.

Analysis of results:

The data set forth above indicate that the out-of-pocket portions of the carload and less-carload operating expenses are 73.8 percent and 68.3 percent of the total operating expenses, rents and taxes. Certain factors not provided for which will tend to either lower or increase these percentages are discussed herewith.

Data appearing in Appendix D indicate that the variable portion of the yard and train expenses (including branch lines operations) is under the figure of 100 percent which was assumed in this study. This has been true particularly where the traffic has been on the increase. However, a measure of the cost of handling added traffic is what the carrier can save if the traffic were eliminated. The experience of 1938 indicates that a given reduction in the traffic volume (measured in gross ton-miles) was followed by an almost equal reduction in the yard and train expenses. The experience during periods of both increasing and decreasing volume must be considered.

The out-of-pocket study does not include any allowances for sales taxes, gross receipts taxes, or other forms of taxes which are affected by changes in the volume of traffic. No data were currently available on this subject. The figures also make no allowance for any return upon the value of the rolling equipment, the investment in which is assumed to be variable, with some lag, with the volume of traffic. If an allowance were included in the out-of-pocket costs for a four percent return upon the value of freight train cars, the carload figure for out-of-pocket costs would be increased from 73.8 to 76.4 percent and less-carload figure from 68.3 to 70.6 percent. 1/ A corresponding allowance for a return on the value of the motive power would increase the figures again by something over one percentage point. No consideration has been given to the effect of added traffic on the investment in road.

The less-carload station expenses do not include any platform work done by train crews, nor was any separation made of the pick-up and delivery work performed by the carriers for themselves. 2/

1/ Based upon a recommended rate-making value for freight-train cars of $1,540,200,000 for railroads included in the cost study. Values are as of December 31, 1939. Excludes freight cars privately owned. Separation of value between carload and less-carload traffic based on active car days in each service.

2/ The carrier's repair and depreciation expenses for pick-up and delivery vehicles are charged to Accounts 328 and 331. The expense for drivers is charged to Account 411. All charges to these accounts were treated as overheads and distributed over all traffic. The expenses involved are small.

It is obvious that any single factor used to reflect the percentage which the out-of-pocket costs constitute of the total operating expenses, rents and taxes is necessarily an approximation. It may represent neither the highest nor the lowest out-of-pocket cost that may obtain under various combinations of circumstances. However, based on the data and assumptions set forth herein, it appears to be reasonable to assume for the purpose of this study that 80 percent of the total operating expenses, rents and taxes assigned and apportioned to the carload and less-carload traffic will cover the out-of-pocket expense of handling such traffic.

CHAPTER VI

Analysis of the Effect of Certain Procedures and Factors Used in the Computation of Territorial Costs

Purpose of this chapter:

In order to expedite this study certain steps were necessary, such as limiting the requests made on the carriers for information to that which was immediately available or which could be compiled within a very short time; the exclusion of the Class II and Class III railroads and the switching and terminal companies; and the development of factors for distributing switching and other expenses from data introduced in the record in various other proceedings before the Commission. To have done otherwise would have resulted not only in extended delays but would have occasioned heavy expense to both the Commission and the carriers. The purpose of this chapter is to provide some information as to the probable errors that may have resulted from this program.

Exclusion of Class II and Class III railroads:

Class II and Class III railroads were omitted from the cost study because their system of accounts did not lend itself to an application of the formula used herein, and also because it was not felt that the inclusion of their expenses in the territorial averages would significantly affect the results. The expenses of the Class II and Class III railroads for 1939 amounted to less than 2 percent of that for the Class I carriers. 1/

The point may be raised that some of the freight traffic of the Class I carriers is given a switching movement by connecting Class II and Class III railways. If the work performed by each of these groups for the other is equal, and if the cost of the service is equal in each case, the cost study will not be affected. On the other hand, if the cost of the work done by each group for the other is not equal, the costs developed in the study for the Class I railroads will be affected to some very small degree. The following figures provide some information on the subject. The switching and station expenses constitute approximately one-third of the total freight operating expenses, rents and taxes of the Class I railroads, or approximately $850,000,000. The operating expenses for the Class II and Class III railroads approximate $41,000,000 (Statistics of Railways, 1939, Tables 159 and 160). Assuming

---

1/ Statistics of Railways in the United States, 1939, Table 156.

that the switching and station expenses for the latter also constitute one-third of their total cost, such expense would approximate $14,000,000. This figure constitutes between 1 and 2 percent of the comparable expenses of the Class I railroads. Inasmuch as any error would only result from the fact that Class II or Class III railroads handled more or fewer cars for Class I railroads than Class I railroads handled for them, or from differences in the cost per car switched, the aggregate error would amount to but a small fraction of the figure of 1 or 2 percent developed above. From the foregoing, it is believed that the effect of the exclusion of the Class II and Class III carriers from the cost study would not significantly affect the territorial cost scales.

Exclusion of th[illegible]witching and terminal companies:

The cost study does not include the switching and terminal companies, although some of these carriers provide switching service for the Class I railways (line-haul carriers). The inclusion of these companies would have required special studies including the territorial separation of the work done at such points as Chicago and St. Louis. The three methods of settlement between the line-haul carriers and switching carriers for switching services are as follows:

(1) Through charges to the joint facility accounts of the Class I line-haul carriers where a joint facility operation exists.,

(2) Through direct payments by the line-haul carrier of the switching charges of the switching and terminal companies. Such payments are a charge against the freight revenues of the Class I line-haul carrier and thus do not appear in its statement of operating expenses.

(3) Through a division of the freight revenues.

Any expenses incurred through the operation of the joint facility accounts, i.e., (1) above, will be reflected in this cost study. Charges incurred through items (2) and (3) above are not picked up in this study and to that degree the study contains an understatement of the expenses. An approximation of the amount of the error may be obtained by comparing the total freight operating expenses, rents and taxes of the Class I switching and terminal companies 1/ for 1939 with that for Class I line-haul companies. The total for the Class I switching and terminal companies was $42,297,067 2/ or 1.68 percent of the total freight

---

1/ The freight operating expenses for the Class II and Class III switching and terminal companies are not available. Their total expenses amounted to 0.65 percent of the total operating expenses for all railway companies. Text of the Statistics of Railways in the United States, 1939, Table 156.

2/ Preliminary Abstract of Statistics of Railways, 1939, Summary No. 5.

operating expenses, rents and taxes of the Class I (line-haul) railways of $2,511,981,244. 1/ These figures are after allowing for the joint facility debits and credits. The figure of 1.68 percent overstates the error in some degree as no allowance is made for the intraterminal or interterminal switching done by these Class I switching and terminal companies for their own account or the switching done for the account of Class II and Class III carriers.

The effect of the understatement is greater on the short hauls as the switching expenses here constitute a greater part of the total cost than on the long hauls. To provide a test in this matter, the entire expense of $42,297,067 for the Class I switching and terminal companies was added to the costs developed for the United States. The station costs were included with expense groups VIII, IX, and X in the proportion obtaining for all Class I line-haul companies. The remaining expenses were added to the switching costs and distributed between all classes of switching in the proportions obtaining for the switching expense for the Class I companies. Table 23 provides a comparison of the costs both including and excluding the switching and terminal companies.

1/ Statistics of Railways in the United States, 1939, Table 113-A.

Table 23. Comparison of Cost Scales Including and Excluding Switching and terminal companies 1/

Haul in miles (1)	Carload traffic						Less-carload	
	5 tons		25 tons		50 tons		5 tons	
	Sw. & term. rys. incl. (2)	Sw. & term. rys. excl. (3)	Sw. & term. rys. incl. (4)	Sw. & term. rys. excl. (5)	Sw. & term. rys. incl. (6)	Sw. & term. rys. excl. (7)	Sw. & term. rys. incl. (8)	Sw. & term. rys. excl. (9)
Terminal 2/ ...	20.1	19.2	4.0	3.8	2.0	1.9	41.7	40.4
50	24.7	23.8	5.2	5.1	2.8	2.7	47.6	46.2
100	29.3	28.3	6.5	6.3	3.6	3.5	53.5	52.1
200	38.5	37.4	8.9	8.7	5.2	5.1	65.4	63.7
300	47.7	46.5	11.3	11.1	6.8	6.7	77.2	75.4
500	66.1	64.7	16.2	15.9	10.0	9.8	100.9	98.7
1,000	112.0	110.1	28.4	28.0	18.0	17.8	160.2	157.0
1,500	158.0	155.6	40.6	40.1	25.9	25.7	219.4	215.2
3,000	295.8	291.9	77.2	76.4	49.8	49.4	397.2	390.0

The exclusion of the expenses for the switching and terminal companies affects the cost by 9 mills or 3.8 percent for a carload movement of 5 tons on a haul of 50 miles. On a 25-ton carload the difference ranges from 1 mill or 2 percent on a 50-mile haul to 8 mills or 1 percent on a haul of 3,000 miles. On a 5-ton load of less-carload traffic the effect is 1.4 mills or 3.0 percent on a 50-mile haul and 7.2 cents or 1.8 percent on a 3,000-mile haul.

Exclusion of the count of cars given an intraterminal or interterminal switching from the total count of cars switched:

The cars given an intraterminal or interterminal switching movement 3/ are not reported by the carriers and hence the total number of cars switched will be somewhat greater than the number used in the

---

1/ The costs shown in columns (3), (5), (7) and (9) differ somewhat from the costs shown for movement in box cars appearing in the Cost Scales, for the United States, Territory No. 12. The reason is that the cost scales were based upon the application of the cost formula, Form A, to each individual railroad, while for the purpose of Table 23 the formula was applied to the aggregate expenses and statistics for all Class I railroads. The sources for the latter are listed in Chapter V, page 72, footnote 1. This procedure is sufficiently accurate for the purpose of the comparisons here being made.

2/ Terminal cost only, exclusive of any line-haul.

3/ See Appendix E for definitions of switching.

computation of costs in this study. Little information is currently available on the subject but it is believed that the number of cars so handled is relatively small, possibly constituting between one and five percent of the total of the cars originated and the cars terminated by the individual carriers. With the switching and station costs constituting about one-third of the total costs for Class I carriers and assuming that the cars given intraterminal or interterminal switching constitute three percent of the total number of cars originated or terminated, the overstatement in costs would approximate one percent on the average length haul. Such overstatement is offset in some degree by the understatement of the costs arising from the exclusion of the expenses for the switching and terminal companies dealt with in the preceding paragraph.

Effect of an adjustment in the ratio of empty to loaded car-miles:

As previously stated, the territorial figures used for the ratio of the empty car-miles to loaded car-miles are based upon the weighted average of the carriers' returns. As the territorial averages developed are relatively uniform at least insofar as box, gondola and hopper and tank cars are concerned, there is reason to believe that these ratios are reasonably correct. 1/ Computations have been made, however, to indicate the effect on the cost of a change in the ratio of five percentage points. The ratio used in the Southern Territory was .294. Table 24 compares the costs for a 25-ton load in box cars based on the figure of .294 and .344, respectively. The cost for any other ratio can be determined by following the procedure outlined in the cost scales, Tables 88 and 89.

Table 24. Effect on Cost of a Change of Five Percentage Points in the Percent Return Empty of Equipment

Haul in miles (1)	Cost in cents per 100 lbs. for 29.4 percent empty return of equipment (2)	Cost in cents per 100 lbs. for 34.4 percent empty return of equipment (3)	Percent difference (4)
Terminal ..	3.2¢	3.2¢	0.0
100	5.6¢	5.7¢	1.8
300	10.4¢	10.6¢	1.9
1,500	39.0¢	39.9¢	2.3

1/ See Appendix B hereto for ratios.

At 300 miles the increase of five percentage points affects the cost by 1.9 percent. The effect at 1,500 miles is 2.3 percent.

Effect on cost of a change in the tare weight:

The territorial tare weights used in the study constitute a weighted average of the carriers' returns. It is reasonable to assume that the data reported are approximately correct as the figures were readily available to each railroad. Computations have been made, however, to indicate the effect on cost of a change of five percent in the tare weights. The average tare weight for box cars developed for the Southern Territory was 22.4 tons. Table 25 shows costs for a 25-ton load moving in box cars having tare weights of 22.4 and 23.5 tons, respectively.

Table 25. Effect on Cost of a Change of Five Percent in the Tare Weight of the Equipment

Haul in miles (1)	Costs per 100 lbs. based upon territorial average tare weight per box car of 22.4 tons (2)	Cost per 100 lbs. based upon assumed tare weight of 23.5 tons (3)	Percent difference (4)
Terminal ..	3.2¢	3.2¢	0.0
100	5.6¢	5.7¢	1.8
300	10.4¢	10.5¢	1.0
1,500	39.0¢	39.7¢	1.8

The variations occasioned by a five-percent change in the tare weights are negligible, amounting to 1.0 percent at 300 miles. The decrease in the percent of change between 100 miles and 300 miles is occasioned by the failure to carry out the figures to more than two places.

Effect of an error in the weighting factors for the several classes of switching:

The switching expenses were apportioned between the various classes of switching on an equated carload basis. The equating factors used were developed from information introduced before the Commission in a number of switching studies but principally those listed in Appendix A hereto. Although it is believed that they represent a reasonable approximation of the relative switch engine time required for the several classes of switching, question may arise as to the effect of a given change in the factors. Such change, while increasing or decreasing the switching cost for any one class of switching relative to the remaining classes, will leave the total switching costs unchanged.

As the costs for interchange and for intertrain and intratrain switching are distributed on a revenue car-mile basis (i.e., treated as variable with the length of haul) any adjustment between these classes of switching which left their combined weighting unchanged would not affect the cost study. The cost is only affected when the weighting giving those classes of switching treated as variable with distance is changed relative to the weighting given to those classes of switching treated as independent of distance. Even then the effect would be nil at any distance approximating the territorial average length of haul as errors in the separation between the line-haul and terminal expenses then cancel themselves out. A comparison of the weighting used in the study with that used for test purposes herein follows: 1/

Class of switching (1)	Weighting used in cost study 1/ (2)	Weighting used for test purposes (3)
1. Carrier terminal switching, and connection terminal switching, industry and team tracks	1.00	1.00
2. Carrier terminal switching, freighthouse	.80	.80
3. Interchange switching	.45	.50
4. [illegible]tertrain and intratrain switching	.25	.30

The effect on cost of changing the relative weighting by five percentage points is shown in Table 26 for net loads of 10, 25 and 50 tons moving in box cars. The results were obtained by reapplying the cost formula to the cost data of a large class I carrier using the adjusted weighting. The costs are in cents per 100 pounds and include operating expenses, rents and taxes.

1/ Weighting applies to the switching movement of a car in the loaded direction only. See Appendix A.

Table 26. Comparison of the Carload Costs in Cents Per 100 Pounds - (Box Cars). Costs Based on a Change of Five Percentage Points in the Weighting Given Interchange and Intertrain and Intratrain Switching

Haul in miles	Net load of 10 tons		Net load of 25 tons		Net load of 50 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	9.8	9.5	4.0	3.8	2.0	2.0
50	11.9	11.6	5.0	4.8	2.7	2.6
100	14.4	14.1	6.2	6.1	3.5	3.4
200	19.5	19.3	8.7	8.6	5.1	5.0
300	24.6	24.5	11.2	11.1	6.7	6.6
500	34.8	34.8	16.1	16.1	9.9	9.9
1,000	60.3	60.6	28.5	28.6	17.9	18.0
1,500	85.7	86.5	40.9	41.2	25.9	26.1

The change in the weighting affects the cost by .3 mills or 3.1 percent for a load of 10 tons and a haul of 10 miles. It tapers off to zero at 500 miles. At 1,500 miles, the difference is 0.9 percent.

If the factor for interchange switching is changed from .45 to .50 and for intertrain and intratrain switching from .25 to .30, leaving the other factors as they are, (i.e., 1.0 and 0.80) the effect on the less-carload costs in cents per 100 pounds for different weight loads will be as follows:

Table 27. Comparison of the Less-carload Costs in Cents Per 100 Pounds - (Box Cars). Based on a Change of Five Percentage Points in the Weighting Given Interchange and Intertrain and Intratrain Switching

Haul in miles	Net load of 3 tons		Net load of 5 tons		Net load of 7 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	45.8	45.0	37.6	37.0	34.0	33.7
50	53.5	52.7	42.5	42.0	37.8	37.5
100	63.1	62.4	48.7	48.3	42.6	42.3
200	82.3	81.7	61.1	60.8	52.1	51.8
300	101,4	101.0	73.5	73.3	61.6	61.4
500	139.8	139.7	98.3	98.2	80.6	80.5
1,000	235.7	236.3	160.4	160.7	128.1	128.3
1,500	331.6	332.9	222.4	223.1	175.6	176.1

The change in the cost as the result of the adjustment ranges from a reduction of 8 mills or 1.7 percent for a load of 3 tons and a haul of 10 miles to an increase of 0.3 percent for a load of 7 tons and a haul of 1,500 miles.

If the weighting factor for carrier terminal switching at freighthouse tracks is given a value of .70 in lieu of .80, and the other factors remain the same (i.e., 1.0, 0.45 and 0.25) the effect on the less-carload cost in cents per 100 pounds for net loads of 3, 5 and 7 tons for a typical road will be as shown in Table 28.

Table 28. Comparison of the Less-carload Cost in Cents Per 100 Pounds - (Box Cars). Based on a Change of Ten Percentage Points in the Weighting Given Carrier Terminal Switching at Freighthouse Tracks

Haul in miles	Net load of 3 tons		Net load of 5 tons		Net load of 7 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	45.8	43.9	37.6	36.4	34.0	33.2
50	53.5	51.5	42.5	41.3	37.8	37.0
100	63.1	61.0	48.7	47.4	42.6	41.7
200	82.3	79.9	61.1	59.7	52.1	51.1
300	101.4	98.9	73.5	72.0	61.6	60.5
500	139.8	136.3	98.3	96.5	80.6	79.3
1,000	235.7	231.7	160.4	157.9	128.1	126.3
1,500	331.6	326.5	222.4	219.3	175.6	173.3

The effect of this change in the weighting is to reduce the cost by 1.9 cents or 4.1 percent for a net load of 3 tons and a haul of 10 miles. For a load of 7 tons and a haul of 500 miles, the reduction in the cost amounts to 1.6 percent. For a load of 7 tons and a haul of 1,500 miles, the reduction would be 1.3 percent.

Effect of an adjustment in the computation of the active car days:

The active car days in the several classes of switching service and in detention for loading and unloading were computed by multiplying the total cars handled by the car-day factors shown in Appendix A. The car days in running service were developed from the train hours. This resulted in the following approximate distribution of the car days for other than mileage cars, class I carriers:

Car days treated as variable with length of haul:

1.	Car days in running service	17.0 percent
2.	Car days in interchange, intertrain and intratrain switching	22.4
3.	Subtotal	39.4

Car days treated as independent of the length of haul:

4.	Car days in switching to and from industry, team and freighthouse tracks	23.5 percent
5.	Car days in detention for loading and unloading	37.1
6.	Subtotal	60.6
7.	Grand total	100.0

Carriers having longer or shorter hauls than the average would, of course, have a distribution somewhat different from that here indicated. The expenses distributed on the basis of active car days constitute between 5 and 6 percent of the total operating expenses, rents and taxes of the Class I carriers. It would take a change of approximately ten percentage points in the percent of active car days treated as variable with the length of haul and a corresponding change of ten percentage points in the percent of active car days treated as independent of the length of haul to affect the total cost on relatively short hauls by as much as 1 percent. At any length of haul approaching the average, the effect of any change in the car-day factors would be nil. It does not appear that any territorial deviations from the car-day factors shown would be great enough to significantly affect the territorial cost.

Effect of a change in the number of cars handled in intertrain and intratrain switching:

The count of cars originated, terminated and interchanged is based upon data appearing in carriers' annual reports. The number of cars given an intertrain and intratrain switching was computed as explained in Appendix A by dividing the total car-miles by 150. The switching expenses charged to intertrain and intratrain switching constitute between 4 and 5 percent of the total operating expenses, rents and taxes, and something in excess of 6 percent of the running expenses only. As these switching expenses are treated as variable with the length of the haul, an adjustment of [illegible] percent in the factor of 150 would have the effect of increasing or decreasing the expenses treated as variable with distance by about 0.4 percent. The carrier's aggregate expenses would remain unaffected as any reduction in the intertrain or intratrain switching expenses would result in such expenses being redistributed between all services on the basis of the remaining switching expenses. On average length hauls the effect would be nil.

Effect of inadequacy of data obtained concerning less-carload platform costs:

The problems confronted in obtaining platform labor costs per ton have been outlined in Chapter IV. For purposes of analysis, the station platform labor cost, Account 373, as used in computing the territorial cost scales and before inclusion of any overhead expenses, is shown in Table 29.

Table 29. Territorial Average Labor Cost Per Ton for Station Platform Labor Exclusive of Overheads

Territory (1)	Platform labor (2)	Tons (3)	Cost per ton (4)
New England	$2,612,552	4,016,294	$0.65049
Eastern, excluding New England and Northern Illinois	13,526,599	19,004,200	.71177
Eastern, excluding New England but including Northern Illinois	16,127,135	21,021,783	.76716
Eastern, including New England and Northern Illinois	18,739,687	25,038,077	.74845
Pocahontas	1,098,558	1,466,094	.74931
Southern	5,532,079	7,567,404	.73104
Western Trunk Line, excluding Northern Illinois and Southern Missouri	5,416,615	5,984,921	.90504
Western Trunk Line, including Northern Illinois but excluding Southern Missouri	8,017,151	8,002,504	1.00183
Southwestern, including Southern Missouri	1,951,478	3,022,177	.64572
Mountain Pacific	3,336,987	3,254,005	1.02550
Total Western	13,305,616	14,278,686	.93185
Total United States	36,075,404	46,332,678	.77862
Northern Illinois	2,600,536	2,017,583	1.28893
Southern Missouri	70,955	111,333	.63732

It is probable that the platform labor cost per ton in all territories will range between 80 cents and $1.00 and where the expenses per ton are below this limit, the less-carload costs developed therefrom may represent some understatement. However, such understatement is not represented by the full amount of the difference between the platform costs shown and any true cost that might be developed for the reason any station expenses not included as platform labor are otherwise included in the study under station expenses "other employees." The effect may be, however, to shift certain of the expenses from less-carload to carload. For the purpose of providing information on this subject data were developed to show the effect if the platform labor cost were increased by 20 cents per ton accompanied by a corresponding reduction in the station expense for "other employees." The data were obtained by applying rail cost formula, Form A, to a representative class I railroad, assuming platform cost per ton, exclusive of overheads, of, first, 102 cents and, secondly, 122 cents. The effect on the less-carload costs per hundred pounds as the result of such adjustment, is shown in Table 30.

Table 30. Comparison of the Less-carload Costs Per Hundred Pounds Assuming an Increase of 20 Cents Per Hundred Pounds in the Platform Costs but with a Corresponding Decrease in the Station Expenses for "Other Employees"

Haul in miles	Net load of 3 tons		Net load of 5 tons		Net load of 7 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	45.8¢	46.9¢	37.6¢	38.6¢	34.0¢	35.1¢
50	53.5¢	54.7¢	42.5¢	43.7¢	37.8¢	39.0¢
100	63.1¢	64.4¢	48.7¢	50.0¢	42.6¢	43.9¢
200	82.3¢	83.9¢	61.1¢	62.7¢	52.1¢	53.7¢
300	101.4¢	103.4¢	73.5¢	75.4¢	61.6¢	63.5¢
500	139.8¢	142.3¢	98.3¢	100.8¢	80.6¢	83.1¢
1,000	235.7¢	239.7¢	160.4¢	164.3¢	128.1¢	132.0¢
1,500	331.6¢	337.1¢	222.4¢	227.8¢	175.6¢	181.0¢

The percent increase occasioned by the adjustment varies from 1.7 percent for a load of 3 tons hauled 1,500 miles to 3.2 percent for a load of 7 tons hauled 10 miles.

The contingent effect on the carload costs follows from a reduction in the total clerical costs, a portion of which was assigned to carload traffic. The carload cost adjustment in cents per 100 pounds is shown in Table 31.

Table 31. Comparison of the Carload Costs Per Hundred Pounds Assuming an Increase of 20 Cents Per Ton in the Station Platform Labor Cost Accompanied by a Corresponding Reduction in the Station Expenses for "Other Employees"

Haul in miles	Net load of 10 tons		Net load of 25 tons		Net load of 50 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	9.8¢	9.7¢	4.0¢	3.9¢	2.0¢	2.0¢
50	11.9¢	11.7¢	5.0¢	4.9¢	2.7¢	2.6¢
100	14.4¢	14.3¢	6.2¢	6.1¢	3.5¢	3.4¢
200	19.5¢	19.3¢	8.7¢	8.6¢	5.1¢	5.0¢
300	24.6¢	24.4¢	11.2¢	11.1¢	6.7¢	6.6¢
500	34.8¢	34.6¢	16.1¢	16.0¢	9.9¢	9.8¢
1,000	60.3¢	60.1¢	28.5¢	28.4¢	17.9¢	17.9¢
1,500	85.7¢	85.6¢	40.9¢	40.8¢	25.9¢	25.9¢

The above adjustments range from no change for a load of 50 tons hauled 10, 1,000 and 1,500 miles to a decrease of 1.7 percent for a load of 10 tons hauled 50 miles.

Effect of an overstatement of the average load on less-carload traffic:

The number of cars of less-carload traffic handled are based on the less-carload tons appearing in Annual Report Schedule 541 and the average load appearing in the Forwarder Report, Senate Resolution 146, 76th Congress, 1st Session, for the test week ended October 7, 1939. As the month of October is usually a period of high traffic, the opportunity of obtaining heavier than average loading is present, with the consequence that the loading factors used may be somewhat overstated. 1/ No information is available as to the degree to which such overstatement exists, but assuming the overstatement amounts to one ton per car, the costs have been recomputed for a representative class I railroad for net loads of 3, 5 and 7 tons. The data appear in Table 32. The effect is to revise slightly the assignment and apportionment of expenses between carload and less-carload traffic which in turn has but a slight effect upon the cost scales.

1/ See Chapter III, Table 8, for the average loads developed from the Forwarder Report on less-carload traffic.

Table 32. Comparison of Less-carload Costs Based upon the Average Load Appearing in the Forwarder Report and the Costs Developed Assuming a Reduction of 1 Ton in Such Average Load 1/

Haul in miles	Net load of 3 tons		Net load of 5 tons		Net load of 7 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	45.8¢	45.5¢	37.6¢	37.4¢	34.0¢	33.9¢
50	53.5¢	53.2¢	42.5¢	42.4¢	37.8¢	37.7¢
100	63.1¢	62.8¢	48.7¢	48.6¢	42.6¢	42.5¢
200	82.3¢	82.0¢	61.1¢	61.0¢	52.1¢	52.0¢
300	101.4¢	101.2¢	73.5¢	73.4¢	61.6¢	61.5¢
500	139.8¢	139.7¢	98.3¢	98.3¢	80.6¢	80.5¢
1,000	235.7¢	235.7¢	160.4¢	160.3¢	128.1¢	128.0¢
1,500	331.6¢	331.7¢	222.4¢	222.4¢	175.6¢	175.6¢

The greatest relative change is for a load of 3 tons and a haul of 10 miles amounting to 3 mills or 0.7 percent. The principal effect of any overstatement of the average loads appearing in the Forwarder Report is in the use of such average loads for the purpose of drawing off costs from the cost scales.

The effect of a reduction in the average load on the cost of carload traffic moving in box cars is negligible as shown in Table 33.

1/ The cost formula makes use of three averages appearing in the Forwarder Report. See Statement 6, columns (13), (14) and (15), respectively. For the purposes of this restatement each of the figures was reduced by 1 ton.

Table 33. Comparison of the Carload Costs Per Hundred Pounds Based on the Average Load for Less-carload Traffic Appearing in the Forwarder Report with the Costs Developed Assuming a Reduction of One Ton in Such Average Load

Haul in miles	Net load of 10 tons		Net load of 25 tons		Net load of 50 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	9.8¢	9.7¢	4.0¢	3.9¢	2.0¢	2.0¢
50	11.9¢	11.8¢	5.0¢	4.9¢	2.7¢	2.6¢
100	14.4¢	14.3¢	6.2¢	6.2¢	3.5¢	3.4¢
200	19.5¢	19.4¢	8.7¢	8.6¢	5.1¢	5.0¢
300	24.6¢	24.5¢	11.2¢	11.1¢	6.7¢	6.6¢
500	34.8¢	34.6¢	16.1¢	16.0¢	9.9¢	9.8¢
1,000	60.3¢	60.0¢	28.5¢	28.4¢	17.9¢	17.8¢
1,500	85.7¢	85.4¢	40.9¢	40.7¢	25.9¢	25.8¢

Effect of an error in the weighting given a carload consignment versus a less-carload consignment in distribution of station costs:

In apportioning the station costs, other than platform labor, to the carload and less-carload traffic, a weight of 1 was given to a less-carload consignment and a weight of 5 to a carload consignment. This ratio was based upon (a) station time studies made by the California Railroad Commission in Case 4402 (See Exhibit 2, pages 98-111) and (b) station time studies conducted by the Boston and Maine and Maine Central in I.& S. Docket 4690, All Commodities, L.C.L. between Maine, Massachusetts and New Hampshire. No time was available to enable additional station studies to be made for the purpose of this study. As a matter of information, the effect of substituting a weight of 4 in lieu of 5 for the carload consignment is shown in Table 34.

Table 34. Comparison of Less-carload Costs in Cents Per Hundred Pounds Giving Weights of 5 and 4, Respectively, to the Carload Consignment in the Distribution of the Station Clerical Expenses 1/

Haul in miles	Net load of 3 tons		Net load of 5 tons		Net load of 7 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	45.8¢	47.3¢	37.6¢	39.0¢	34.0¢	35.5¢
50	53.5¢	54.9¢	42.5¢	44.0¢	37.8¢	39.3¢
100	63.1¢	64.5¢	48.7¢	50.2¢	42.6¢	44.0¢
200	82.3¢	83.7¢	61.1¢	62.6¢	52.1¢	53.5¢
300	101.4¢	102.9¢	73.5¢	75.0¢	61.6¢	63.0¢
500	139.8¢	141.3¢	98.3¢	99.8¢	80.6¢	82.0¢
1,000	235.7¢	237.2¢	160.4¢	161.8¢	128.1¢	129.5¢
1,500	331.6¢	333.1¢	222.4¢	223.8¢	175.6¢	177.0¢

The greatest relative increase is 1.5 cents, or 4.4 percent, for a load of 7 tons hauled 10 miles. The least relative effect is 1.5 cents, or 0.5 percent, for a load of 3 tons hauled 1,500 miles.

The corresponding effect on the carload costs in cents per hundred pounds is shown in Table 35.

Table 35. Comparison of Carload Costs in Cents Per 100 Pounds Giving Weights of 5 and 4, Respectively, to the Carload Consignments in the Distribution of Station Clerical Expenses

Haul in miles	Net load of 10 tons		Net load of 25 tons		Net load of 50 tons	
	Unadjusted	Adjusted	Unadjusted	Adjusted	Unadjusted	Adjusted
10	9.8¢	9.8¢	4.0¢	3.9¢	2.0¢	2.0¢
50	11.9¢	11.8¢	5.0¢	4.9¢	2.7¢	2.7¢
100	14.4¢	14.3¢	6.2¢	6.2¢	3.5¢	3.5¢
200	19.5¢	19.4¢	8.7¢	8.6¢	5.1¢	5.1¢
300	24.6¢	24.5¢	11.2¢	11.1¢	6.7¢	6.7¢
500	34.8¢	34.7¢	16.1¢	16.1¢	9.9¢	9.9¢
1,000	60.3¢	60.2¢	28.5¢	28.5¢	17.9¢	17.9¢
1,500	85.7¢	85.6¢	40.9¢	40.8¢	25.9¢	25.9¢

1/ Study computed by applying rail cost formula, Form A, to a representative class I carrier using first a weight of 5, and, secondly, a weight of 4 to the carload consignments in distributing the station clerical expenses. Costs include operating expenses, rents and taxes (Cost Level II).

In no case are the carload costs effected by more than one mill.

Costs for traffic consistently moving in lighter than average, or in heavier than average, trains:

The costs developed in this study are territorial averages reflecting all operating conditions. If a segregation of costs were made between main and branch line operations, it is reasonable to expect that the costs for the branch lines would be higher than the costs set forth in this study. On the other hand the cost for main line operations would be only slightly less than the figures shown in this study, as the overwhelming proportion of the tonnage hauled by most carriers is handled in main line through trains. Where this condition obtains the average cost for this main line traffic is not greatly different from the system average cost for all traffic. If the main line costs were segregated to reflect the unit expense for heavy tonnage trains, such as coal drags, as compared to the cost for scheduled merchandise trains with a lighter tonnage, some difference in cost would no doubt be found. This leads to the observation that where one type of traffic predominantly moves in either heavy tonnage or light tonnage trains, the costs for such traffic will be greater or less than those shown in the cost scales. Coal is an example of tonnage which may be handled regularly in heavier than average trains while less-carload traffic may be at the other extreme.

To provide information relative to the fluctuation in costs with variations in the weight of the train the expense was developed for the handling of varying net loads in trains of 500, 1,000, 2,000, 3,000 and 4,000 trailing gross tons.

Table 36 shows the cost for the various weight trains for varying distances. The data were obtained by applying rail cost formula, Form B, 1/ to the system accounting and statistical data of a representative class I carrier. The assumption was made that trains of 500 and 1,000 tons were hauled by locomotives having a gross weight of 150 tons including tender, and that the trains of 2,000, 3,000 and 4,000 tons were hauled by locomotives weighing 200 tons. For purposes of comparison an index is shown in columns (3), (5) and (7) based on the cost for a 2,000-ton train taken as 100.

1/ Rail cost formula, Form B, was developed by the Bureau of Statistics for the purpose of reflecting, among other things, the cost based upon the weight of the train in which the traffic is handled.

Table 36. Comparison of the Cost Per Hundred Pounds for Varying Trainload Weights Based on 25-Ton Load Handled in Box Cars 1/

Gross tons of cars, contents and cabooses (1)	25 miles		50 miles		300 miles	
	Cost (2)	Index (3)	Cost (4)	Index (5)	Cost (6)	Index (7)
500	5.14¢	115	6.31¢	127	-	-
1,000	4.67¢	105	5.37¢	108	-	-
2,000	4.46¢	100	4.96¢	100	9.93¢	100
3,000	4.38¢	98	4.80¢	97	8.90¢	91
4,000	4.31¢	97	4.72¢	95	8.48¢	85

The above comparison is based on the assumption that the engine crew and train crew costs per mile are the same for all weight trains. The comparison shown in Table 37 assumes that the train and engine-crew costs per train-mile, including a prorata portion of the superintendence, Account 371, and the accompanying payroll taxes, are 20 percent 2/ higher for trains of 500 and 1,000 tons than trains of 2,000 to 4,000 tons.

Table 37. Comparison of the Cost Per Hundred Pounds for Varying Trainload Weights Based on a 25-Ton Load in Box Cars. Assumes a 20-Percent Increase in Train and Engine Crew Compensation Per Train-mile for Trains of 500 and 1,000 Tons over That for Trains of 2,000 Tons

Gross tons of cars, contents and cabooses (1)	25-mile haul		50-mile haul	
	Cost (2)	Index (3)	Cost (4)	Index (5)
500	5.21¢	117	6.45¢	130
1,000	4.70¢	105	5.43¢	109
2,000	4.46¢	100	4.96¢	100

1/ Includes operating expenses, rents and taxes, Cost Level II. Based on ratio of empty car-miles to loaded car-miles of 0.36.

2/ The figure of 20 percent represents an arbitrary allowance for the higher wage scale and increased overtime commonly obtaining in way train operation.

The reason for the relatively small adjustment occasioned by changes in the weight of the train on short hauls is that the expenses affected by the weight of the train, i.e., the running expenses, constitute but a small part of the total cost. This is indicated in Table 38 which shows the percent that the running cost bears to the total cost for hauls of 25, 50 and 300 miles and train loads of from 500 to 4,000 tons.

Table 38. Percentage Relation of the Running Cost to the Total Cost 1/

Weight of trains including locomotive and tender (tons) (1)	25-mile haul		50-mile haul		300-mile haul	
	Unadjusted expenses (2)	Adjusted for 20% increase trainmen and enginemen (3)	Unadjusted expenses (4)	Adjusted for 20% increase trainmen and enginemen (5)	Unadjusted expenses (6)	Adjusted for 20% increase trainmen and enginemen (7)
500	21.43	22.42	34.98	36.27	-	-
1,000	14.18	14.75	24.60	25.52	-	-
2,000	10.40	-	18.72	-	56.05	-
3,000	8.85	-	16.17	-	51.87	-
4,000	7.47	-	14.34	-	49.45	-

The comparisons shown above necessarily represent approximations based on average terminal costs. 2/ They nevertheless serve to indicate that on short hauls of 25 to 50 miles the running expenses account for a minor part of the total costs with the result that substantial changes in the running cost have but a limited effect upon the total cost. No data were available to compute the relative cost for train switching as compared to yard switching and the terminal costs are based upon the system average expenses for the latter.

Error in use of single ratio to allow for a return on traffic moving in both railroad owned and privately-owned equipment:

Under the formula used the allowance for a return is obtained by multiplying Cost Level II by a given percentage which is the same irrespective of whether the traffic is moving in railroad owned or privately-owned equipment. This involves some error inasmuch as the rental

---

1/ Includes an allowance for intertrain and intratrain switching assuming one handling every 150 miles of haul. This is distributed prorata over the shorter hauls of 25 and 50 miles.

2/ For the purpose of this study the yard engine minutes per loaded car were assumed to be 27 minutes at origin and 27 minutes at destination (based on averages for both large and small terminals).

payments on private line cars include an allowance for a return upon the value of this equipment. To expand the cost, including such rental, for a return is to include the return on freight-train car equipment twice. On the other hand, traffic moving in railroad-owned equipment is relieved of the full cost of providing a return on the property used by it in the amount that the burden placed on the traffic moving in private line cars is excessive.

The error may be eliminated by computing the ratio of the return on the carrier property used in common by all traffic, (i.e., the total property excluding freight trains cars) to the total expenses for all traffic. Next, the ratio of the return upon the value of the railroad-owned freight-train cars to the operating expenses for the traffic handled in this equipment should be computed and added to the ratio previously obtained. The sum of the two ratios provides that ratio applicable on traffic handled in railroad-owned equipment. The ratio first computed, with possibly some increase for return on special facilities used, is applicable to commodities handled in private line cars.

The principal problem faced in making the required adjustment is that of separating the operating expenses (running, switching and station) for the traffic moving in railroad-owned equipment from that for traffic moving in privately owned equipment. For purposes herein this was accomplished by separating each group of expenses on the basis of car-miles, gross ton-miles, or cars handled, as appropriate, using for this purpose the aggregate expenses for all class I carriers. The results indicated that a 5-3/4 percent return upon the value of the property common to all freight service amounted to 44.39 percent of the total carload operating expenses, rents and taxes. The allowance for a 5-3/4 percent return upon the value of railroad-owned freight-train cars amounted to 5.42 percent of the operating expenses, rents and taxes assigned and apportioned to the traffic moving in such cars. The sum of these two figures, 49.81 percent, constitutes that figure properly applicable against traffic moving in railroad-owned cars. The two figures of 44.39 and 49.81 percent applicable to traffic moving in private line and railroad-owned equipment, respectively, may be compared with the single figure of 48.05 percent shown in the cost scales, Table 87, column (66).

From the foregoing the conclusion may be drawn that the figure of 48.05 percent used in the cost scales is high by approximately 3.7 percentage points when applied to traffic moving in private line equipment and low by approximately 1.8 percentage points when applied to traffic moving in railroad-owned equipment. The comparable errors when based on a 4-percent return amount to 2.6 and 1.2 percentage points, respectively. These errors relate to the ratio by which the operating expenses, rents and taxes are expanded to include return. The error expressed in terms of the costs after expansion to Cost Levels V(a) or

V(b) amounts to an understatement of approximately 1 percent for traffic moving in railroad-owned equipment and an overstatement of approximately 2 percent for traffic moving in private line equipment.

Resume:

This chapter has dealt with certain technical problems involved in cost finding. When subsequent studies of this character are made, a refinement will be possible in the various respects above indicated if the time to conduct the necessary field studies is allowed. However, before the additional time and expense are incurred in such special studies, it appears desirable to consider in a broad way what are the relative costs among the rate territories and what part costs should play in a revision of rate scales. The present study is adequate for this purpose as it appears from the above discussion that the possible errors are of a minor character.

In addition to the technical problems of cost finding which may affect the final costs by a relatively small amount one way or another, other factors must necessarily be given consideration in applying the cost scales to actual rate-making, such as the following: The average circuity of haul obtaining in each territory; the determination of what constitutes a proper rate of return; the degree to which rates on some traffic should be based on out-of-pocket costs to meet truck and water competition, with an accompanying upward adjustment on the noncompetitive traffic; and the problem of developing a proper relation between cost and the rates applicable to each class rating.

APPENDIX A

Explanation of Factors Used in the Formula

Weighting factors used in computing switching costs:

In securing the separation of the switching expenses between the various classes of switching on an equated car handled basis, the following weighting was applied to the number of cars handled in each of the classes of switching:

Carrier terminal switching and connection terminal switching, industry and team tracks, including an allowance for intermediate switching 1/	1.00
Carrier terminal switching and connection terminal switching, freighthouse tracks	.80
Interchange switching, including allowance for intermediate switching 1/	.45
Intertrain and intratrain switching	.25

The above weighting applies to the switching movement of a car in the loaded direction only. If one assumes that the ratio of the empty cars switched to loaded cars switched for each of the four classes of switching are 1.00, 0.80, 0.65 and 0.65, respectively, the relative weighting for the total switching in each class for the loaded plus the empty movement, becomes as follows: 1.00, 0.72, 0.37, and 0.21. The weight thus given for an interchange switching of 0.37 reflects the cost for the switching in both the loaded and empty direction by a single carrier. This figure should be doubled to reflect the relative work done by both the carriers party to an interchange.

The above switching factors are based upon switching data for a large number of cities introduced in cases before the Commission, including the following:

Switching at Kansas City, Mo., and Related Points	96 I.C.C. 538
Switching at St. Louis, Mo., and East St. Louis, Ill., Also Between St. Louis, Mo., and Suburban Stations in Missouri	120 I.C.C. 216
Switching at Little Rock and North Little Rock, Ark.	140 I.C.C. 583
Des Moines Union Railway Switching	231 I.C.C. 631
Naval Stores from Mississippi to Gulf Ports	235 I.C.C. 723
Packing House Products from Denver and Pueblo to Arizona	238 I.C.C. 569
Petroleum and Petroleum Products from California to Arizona	241 I.C.C. 21
Docket 26712, Rail-Barge Joint Rates	
F.S.A. 18444, Sugar from California to North Atlantic Ports	

1/ Allowance based on the assumption that, exclusive of the work done by switching and terminal companies, not over 5.0 percent of the cars handled received an intermediate switching. See Appendix E for definition of intermediate switching. Switching and terminal companies are excluded from study.

Car-day factors:

The active car days in running service were computed by multiplying the system train hours, including train switching hours, by the average cars per train and dividing the product by 24. The car days in switching service were computed by multiplying the number of loaded and empty cars handled by the following car-day factors:

Carrier terminal and connection terminal switching, industry, teamtracks and freighthouses	0.50 days
Interchange switching per carrier	.33 days
Intertrain and intratrain switching	.33 days
Detention for loading or unloading (but not both) at industry and teamtracks	1.75 days
Detention for loading or unloading at freighthouses	.50 days

Car days for "other than mileage" cars in running service were obtained by multiplying the total days in running service by the ratio of the car-miles for "other than mileage" cars to the total car-miles. The car days for "other than mileage" cars in switching service were obtained by--

(a) Multiplying the sum of the car days for interchange switching and intertrain and intratrain switching by the ratio of the car-miles for "other than mileage" cars to the total car-miles, and

(b) Multiplying the remaining car days in switching service, excluding freighthouse cars, by the ratio of the loaded cars handled of "other than mileage" cars to the total loaded cars handled. Switching car days occasioned by freighthouse switching were assigned to "other than mileage" cars.

The source of the car day factors is based upon an analysis of the cases mentioned above in connection with switching factors.

Separation of car-miles; running and switching:

The car-miles in running service were determined from the annual report, Schedule 531, items 40, 41 and 42. Car-miles in switching service were obtained by multiplying the number of loaded and empty cars handled in each class of switching by the following mileages:

Carrier terminal and connection terminal switching, industry and team tracks	4.0 miles
Carrier terminal and connection terminal switching, freighthouses	3.5 miles
Interchange switching per carrier	2.75 miles
Intertrain and intratrain switching	1.00 miles

The mileages were based on a study by the Engineering Section of the Bureau of Valuation of the terminal lay-outs of a number of railroads. A weight of 1.0 is given to a car-mile in running service and a weight of 2.0 to a car-mile in switching service. This weighting is based on a study by the Engineering Section of the Bureau of Valuation.

Count of cars:

The switching factors, car-day factors, and mileage factors set forth above are applied to the count of the loaded cars plus the empty cars handled in each class of switching. The count of cars was obtained as follows:

Item	Source
1. Carrier and connection terminal switching, industry and team tracks, loads	From A.R. Sch. 541, Class 850, sum of columns (d), and (f) plus twice column (b)
2. Carrier and connection terminal switching, industry and team tracks, empties	Number of loads handled multiplied by the ratio of the total empties spotted and switched out to the total loads spotted and switched out. For the purpose of carload traffic, the ratio used was 1.0.
3. Carrier terminal switching, nonrevenue traffic, loads	Developed by dividing the total tons of nonrevenue freight carried by the average net load of company material to obtain the total number of loaded cars handled, nonrevenue freight. This latter figure was multiplied by 2 assuming that these nonrevenue loads were principally local to one line.
4. Carrier terminal switching, nonrevenue traffic, empties	Number of loads, nonrevenue, multiplied by the ratio of 1.0.
5. Carrier and connection terminal switching, freighthouse tracks, loads	(a) Total tons of less-carload traffic handled - From A.R. Sch. 541, Class 710, sum of columns (e) plus (g) plus twice column (c) (b) Average load, tons per loaded car - From Senate Resolution 146, 76th Congress, First Session, Vol. 1, Statement 6, column (14) (c) Number of loaded cars - Line (a) divided by line (b) (d) Number of loaded cars originated or terminated, re transfers - Tons transferred divided by average load, line (b) (e) Total cars - Line (c) plus line (d)

Item	Source
6. Carrier and connection terminal switching, freighthouse tracks, empties	Number of loads handled multiplied by the ratio of the total empties spotted and switched out to the total loads spotted and switched out. For the purpose of this study the ratio used was 0.80.
7. Interchange switching, loads	Computed as follows: (a) Number of cars, carload traffic - From A.R. Sch. 541, Class 850, sum of columns (d) plus (f) plus twice column (h) Number of cars less-carload traffic: (b) Number tons received from and delivered to connections - From A.R. Sch. 541, class 710, columns (e) plus (g) plus twice column (i) (c) Percentage of tons (interline traffic) in through cars not worked at interchange - From Senate Res. 146, Statement 6, column (3) divided by (2) (d) Number of tons (interline) in through cars not worked at interchange points - Line (b) x line (c) (e) Average tons for through car, interline - From Senate Res. 146, Statement 6, column (13) (f) Number of cars not worked at interchange - Line (d) divided by line (e) (g) Total cars, carload and less-carload - Line (a) plus line (f)
8. Interchange switching, empties	Number of empties computed by multiplying the number of loads by the system ratio of empty car-miles to loaded car-miles.
9. Intertrain and intratrain switching, loads	Computed by dividing the total car-miles by 150. Based on factor of 150 car-miles per handling. This factor was developed from studies introduced before the Commission including Packing House Products from Denver and Pueblo to Arizona, 238 I.C.C. 569; Petroleum and Petroleum Products from California to Arizona, 241 I.C.C.21; and Sugar from California to North Atlantic Ports, F.S.A. 18444. These studies show the distance between intertrain and intratrain handlings to range from approximately 100 to 160 miles, and the average car-miles for intertrain and intratrain switching to range from 125 to 160 miles.

Item	Source
10. Intertrain and intratrain switching, empties	The number of empties computed by multiplying the number of loads by the system ratio of empty car-miles to loaded car-miles

The ratio of empty cars spotted and pulled to loaded cars spotted and pulled was based upon fragmentary evidence appearing in the cases above cited, which indicated that such ratio was slightly less than 1.0. However, the figure of 1.0 is used for purposes herein in conjunction with the use of a factor of 0.80 for freight-house switching. Any change in these ratios does not affect the carriers' aggregate costs, although it does affect, in some more or less negligible degree, the distribution of the expenses between line-haul and terminal and between carload and less-carload traffic. See Chapter VI for a discussion of the influence of a change in these factors.

APPENDIX C

Assignment of Commodities to That Class of Equipment in Which They Are Commonly Handled 1/

No.	Commodity group or class	Class of freight car

1/ Tare weights are based on a weighted average of the tare weights for railroad owned equipment as reported by the carriers in reply to a questionnaire issued under date of November 19, 1940. Territorial averages obtained by weighting the weight reported by each carrier for each class of equipment by the number of carloads forwarded in such class of equipment by each carrier.
Ratios of empty to loaded car-miles are based on the data furnished by carriers in response to questionnaire under date of November 19, 1940. Territorial averages obtained by weighting the ratio of the empty to loaded car-miles reported by each carrier for each class of equipment by the number of carloads forwarded in such class of equipment by each carrier.

2/ Figures based on railroad owned equipment. United States average tare weights used for all territories in compiling cost scales.

3/ No information provided.

1/ The assignment of commodities is based on estimate as no data were available. The material was used for the following purposes.

1. To determine the aggregate carloads and tons handled by classes of cars from which was obtained the average net load by classes of equipment used in computing the nonrevenue gross ton-miles.
2. The separation of active car days in terminal between mileage cars and other than mileage cars.
3. The computation of the average loads by classes of equipment appearing in Chapter III, Table 4.

APPENDIX D

Data Considered in the Determination of the Out-of-pocket Costs

This appendix reviews some of the material given consideration in computing the out-of-pockets appearing in Chapter V of this study. The data are supplementary to those referred to in Table 19 of Chapter V and show the results of studies made to determine the degree to which the transportation expenses are affected by the changes in traffic volume based on the experience of the class I carriers in recent years.

It may here be explained that if a traffic increase of 20 percent is accompanied by an increase of 20 percent in the fuel expenses, the conclusion is drawn that the fuel expenses are 100 percent variable with changes in the volume of traffic. If the fuel expenses increase by only 10 percent, the conclusion can be drawn that the fuel consumption is only 50 percent variable with traffic changes. If no increase in fuel consumption is found, it is assumed that this expense item is independent of changes in the volume of traffic. The out-of-pocket portion of the cost in each case is 100 percent, 50 percent, and zero, respectively.

One of the difficulties encountered in tracing the relation between the changes in expenses and the changes in traffic volume is that of eliminating the influence of price changes and wage adjustments. Where the study is based on an extended period of time as shown in Table 1 below, the analysis is limited to the effect of the changes in traffic volume upon the car-miles, train-miles and yard engine hours, the assumption being made that any change in those units will be followed by corresponding changes in the freight train car expenses, train service expenses and yard expenses, respectively.

In Tables 1 and 2 to follow, the changes in traffic volume are measured in terms of gross ton-miles. However, as developed in Table 1 below, any given change in the gross ton-miles is followed by a still greater change in the net ton-miles; or, as otherwise stated, the net ton-miles are something more than 100 percent variable with the gross ton-miles. From this the conclusion may be drawn that as the volume of traffic increases the tare tons required to handle a given volume of net tons is reduced. On the other hand when the traffic decreases the ratio of the tare tons to the net tons increases. It follows that the percentage by which any expense item is found to be variable with traffic changes, measured in terms of gross ton-miles, may be overstated somewhat as compared with the percent found variable when the traffic change is measured in terms of net ton-miles.

Table 1, column (2) shows the gross ton-miles of cars, contents and cabooses; column (3), the percent change from the gross ton-miles of the preceding year; column (4) the revenue net ton-miles; column (5) the percent change of the revenue ton-miles from that of the preceding year; and column (6) the percent variable of the revenue net ton-miles with changes in the gross ton-miles. The remaining columns are self-explanatory. The data are shown for the United States and for the Eastern, Southern and Western Districts. For the purpose of indicating the average or central tendency of the percent variable, the median, or middle item, is shown. The use of this average eliminates distortion occasioned by the extremes.

Table 2 shows the effect of changes in traffic volume on selected expense items or group of expenses. The study was limited to the period 1935-1939 to avoid the extreme fluctuations of the period 1930-1934. The expenses were adjusted for changes in fuel prices and basic rates of pay.

Column (2) of Table 2 shows the gross ton-miles of cars, contents and cabooses; column (3), the percent change from the gross ton-miles of the preceding year; column (4), the adjusted expenses for superintendence; column (5), the percent change of the adjusted expenses from the expenses of the preceding year; and column (6), the percent variable of the adjusted expenses with changes in the gross ton-miles. The remaining columns are self-explanatory. The data are shown for the United States and for the Eastern, Southern, and Western Districts.

The adjusted expenses shown in Table 2 were obtained by dividing the charges to each account by the index developed for the labor included in each account shown in Table 3. Where the accounts were grouped as in the case of the yard service expenses, train service expenses, and total transportation expenses (Accounts 371 to 420), the adjustment was made by individual accounts and the total of the adjustments added to or subtracted from the total of the unadjusted expenses for the group.

The wage index for employees' compensation was based on the year 1936 as 100 and reflected the following changes in the basic rates of pay 1/: A 2-1/2 percent restoration, effective January 1, 1935, of the 10 percent reduction in the employees' compensation made as of February 1, 1932; a 5 percent restoration, effective April 1, 1935; an increase of 5 cents per hour for all employees other than those in train and engine service and train dispatchers, effective August 1, 1937; and an increase of 44 cents per day (approximately 5.5 cents per hour) for train and engine service employees and yardmasters, effective October 1, 1937. 2/

The price index for fuel, 1936-1939, was based on the average price per equated ton of fuel consumed, using 1936 prices as 100. The price per ton was computed by dividing the total charges for fuel consumed, including freight and handling expenses, by the equated tons of fuel consumed. 3/ As the costs for the equated tons of fuel consumed were not available for the year 1935, the adjusted fuel expenses (freight) for this year were computed by multiplying the 1936 fuel cost by the ratio of the equated tons (freight) consumed in 1935 to the equated

---

1/ Wage increases stated as a flat amount per hour, per day, or per month occasioned different percentage increases according to the level of wage previously earned by each group of employees. To compute the index for various groups of employees the following procedure was used based on the year 1938 as an example: The number of hours or days of straight time worked by each group of employees in 1938 was multiplied by the increase per hour or per day. The aggregate increase so determined was then divided by the actual straight time compensation earned during 1938 less the increase. The effect of this procedure was to divide the increase by the aggregate compensation which the employees would have received without such increase. The percentage indicated the effect of the increase for the group. The procedure may be illustrated as follows: During 1938 the straight time paid for, yard engineers and motormen and firemen and helpers, class I railroads, amounted to 61,519,533 hours (from Wage Statistics of class I Steam Railways in the United States for the 12 months ended December 31, 1938, Statement No. M-300, Divisions 124 and 128). The increase of 5.5 cents per hour resulted in an aggregate increase of $3,383,574. This increase was deducted from the compensation for the straight time paid for amounting to $54,890,533, resulting in a total compensation, less such increase, of $51,506,959. The increase when related to this base amounted to 6.57 percent. Based on 1936 the index for the year 1938 was therefore 106.57. Inasmuch as the wage increase was in effect for only one-quarter of the year 1937, the index for this year was 101.64, or 100 increased by one quarter of 6.57.

2/ From Historical Development of the Present Railway Wage Structure 1916-1938, Exhibit No. 1, President's Emergency Board's Hearings on Railway Wages, October 1938, pages 66, 67, 70 and 71.

3/ The statement of fuel expenses and equated tons consumed for the years 1936-1939 appears in the summary of Fuel and Power for Locomotives and Rail Motor Cars of class I Steam Railways in the United States, Statement M-230 (OS-E). Line 1-07 divided by the sum of lines 2-07, 2-13 and 2-22.

tons consumed in 1936. 1/ This provided the fuel expense for 1935 based on 1936 prices.

The wage indices shown in Table 3 were used in adjusting the expenses both for the United States and each district. A separate fuel index was computed for each territory. Except in the case of enginehouse expenses the adjustments were made by dividing the aggregate charges to the respective accounts by the index shown. In the case of enginehouse expenses the adjusted labor cost was obtained by dividing the index into the labor compensation, divisions 108, 109 and 110 (Wage Statistics of class I Steam Railways in United States, Statement No. M-300). The amount of the adjustment was subsequently added to or subtracted from the total charges to Accounts 388 and 400.

Consideration was also given to data on out-of-pocket costs appearing in the following:

1. "Out-of-Pocket Cost as a Factor in Determining Freight Rates" (I.C.C., Bureau of Statistics) - by M. O. Lorenz and B. T. Elmore, 1933.
2. Study by California Railroad Commission entitled, "Rail Cost Finding for Rate-Making Purposes," introduced as Exhibit 2 in Case 4402, pp. 135-165 (1938).
3. "The Economics of Transportation" - by Kent T. Healy, Ronald Press, N.Y., 1940, Chapter 11.
4. "Railroad Costs and Volume of Traffic," Herbert Ashton, American Economic Review, Vol. XXX, No. 2, June 1940.
5. F.S.A. 18444, Sugar from California to North Atlantic Ports.

Tables 1, 2 and 3 follow herewith.

1/ Equated tons for 1935 and 1936 from the Statistics of Railways in the United States, Table 56-A, Item XIII, line 5, and freight portion of line 7 based on freight portion of Account 382, yard fuel expenses.

Footnotes for Table 2, Appendix D

1/ Because of the wide variation shown in the percent variable for station employees and in view of the significance of this account, the study was continued to reflect the experience of 1940 from data appearing in each Class I carrier's annual report. The percent variable for the United States was found to be 22.61% and the 1935-1940 median 57.42%.

2/ The adjustments for wage changes were made to the following accounts, based on the indices shown in Table 3: Accounts 371, 372, 373, 377, 378, 379, 380, 381, 388 (hostlers and hostler helpers), 392, 393, 400 (hostlers and hostler helpers), and 401. The adjustments for fuel price changes were made to the following accounts, based on the indices appearing in Table 3: Accounts 382, 383, 384, 394, 395, and 396. For lack of information no adjustment was made on the remaining accounts.

3/ The traffic expenses were adjusted by computing the ratio of the adjusted general expenses, excluding pensions, for each year to the unadjusted general expenses, excluding pensions. The unadjusted traffic expenses for each year were then multiplied by the ratio so developed. The ratios computed for the years 1935-1939 were, respectively, 100.95, 100.00, 97.97, 95.28, 95.32.

4/ The adjustments for wage changes were made to accounts 451 and 452, based on the indices shown in Table 3. No other adjustments were made. Pensions were excluded because of the distortion in the expenses occasioned by the revision of the pension program during the period of study.

Source: Gross ton-miles--Cars, contents and cabooses are from Freight Train Performance of Class I Steam Railways in the United States, Statement M-211. Adjusted expenses are based on those assigned and apportioned to freight service as shown in Operating Revenues and Operating Expenses by Class of Service, Class I Steam Railways in the United States for the years 1935 and 1936, and as shown in the Preliminary Abstract of Railway Statistics for the years 1937-1939, inclusive, and on the wage scale and fuel price adjustments indicated by Table 3.

Table 3. Indices Used in Adjusting Expenses for Changes in Wage Rates and Fuel Prices, Class I Steam Railways, 1935-1939

452	Salaries and expenses of clerks and attendants 6/ ...	98.75	100.0	102.91	106.98	106.98

1/ Index based on divisions 1-26, incl., reported in Wage Statistics of class I Steam Railways, Statement No. M-300.

2/ Index based in divisions 78-82, incl., 84-92, incl., and 94.

3/ Separate indices were computed for yardmasters and assistants and yard clerks. A weighted average was taken in computing the combined index for both. Index for yardmasters based on divisions 105 and 106. Index for assistants and yard clerks based on divisions ~~3, 5-26~~ 4-26, incl.

4/ Index based on divisions 108-110.

5/ Index based on division 1.

6/ Index based on divisions 4-26, incl.

APPENDIX E

Definitions of the Switching Terms Used in the Study 1/

1. Carrier terminal switching is a primary class of transportation switching service which includes all the elements of switching performed at origin and destination terminals by the initial and final line-haul carriers.

2. Connection terminal switching is a primary class of transportation switching service which includes all the elements of switching performed at origin and destination terminals by carriers, which as to the particular traffic (1) do not provide line-haul service, and (2) do not provide intermediate switching service.

3. Interchange switching is a primary class of transportation switching service which includes all the elements of switching performed in taking cars from the road train of one line-haul carrier and placing them in the road train of another line-haul carrier in the same terminal district except that it excludes intermediate switching, if any. 2/

4. Intermediate switching is a primary class of transportation switching service which includes all the elements of switching performed by a carrier which neither originates nor terminates the shipment nor performs a line haul on that shipment, the extent of the carrier's participation in the movement being only that of a connection between two other carriers.

5. Interterminal switching is a primary class of transportation switching service performed in handling a car from a track served by a carrier to a track served by another carrier when both tracks are within the switching limits of the same station or industrial switching district.

6. Intertrain switching is a primary class of transportation switching service which includes all the elements of switching performed in taking a car out of a train and placing it in another train of the same carrier at the same station or terminal.

1/ From Sioux City Terminal Railway Switching, 241 I.C.C. 53, 90.

2/ For the purpose of this study, a separate count is given to the cars handled by each carrier participating in the interchange switching service.

7. Intraterminal switching is a primary class of transportation switching service performed in handling a car from a track served by a carrier to another track served by the same carrier when both tracks are within the switching limits of the same station or industrial switching district.

8. Intratrain switching is a primary class of transportation switching service which includes all the elements of switching performed in taking a car out of a train and replacing it either in the same or another position in that train.

48. Carload Commodities Moving in Refrigerator Cars 82
49. Less-carload Traffic 83

Cost Scales for Territory 8, Western Trunk Line, Excluding Northern Illinois and Southern Missouri

50. Carload Commodities Moving in Box Cars 85-86
51. Carload Commodities Moving in Flat Cars 87-88
52. Carload Commodities Moving in Gondola and Hopper Cars 89-90
53. Carload Commodities Moving in Tank Cars 91-92
54. Carload Commodities Moving in Stock Cars 93
55. Carload Commodities Moving in Refrigerator Cars 94
56. Less-carload Traffic 95

Cost Scales for Territory 9, Western Trunk Line, Including Northern Illinois but Excluding Southern Missouri

57. Carload Commodities Moving in Box Cars 97-98
58. Carload Commodities Moving in Flat Cars 99-100
59. Carload Commodities Moving in Gondola and Hopper Cars 101-102
60. Carload Commodities Moving in Tank Cars 103-104
61. Carload Commodities Moving in Stock Cars 105
62. Carload Commodities Moving in Refrigerator Cars 106
63. Less-carload Traffic 107

Cost Scales for Territory 10, Mountain Pacific

64. Carload Commodities Moving in Box Cars 109-110
65. Carload Commodities Moving in Flat Cars 111-112
66. Carload Commodities Moving in Gondola and Hopper Cars 113-114
67. Carload Commodities Moving in Tank Cars 115-116
68. Carload Commodities Moving in Stock Cars 117
69. Carload Commodities Moving in Refrigerator Cars 118
70. Less-carload Traffic 119

Table Page

Cost Scales for Territory 11, Total Western, Including Southwestern, Western Trunk Line, Mountain Pacific, Northern Illinois and Southern Missouri

71. Carload Commodities Moving in Box Cars 121-122
72. Carload Commodities Moving in Flat Cars 123-124
73. Carload Commodities Moving in Gondola and Hopper Cars 125-126
74. Carload Commodities Moving in Tank Cars 127-128
75. Carload Commodities Moving in Stock Cars 129
76. Carload Commodities Moving in Refrigerator Cars 130
77. Less-carload Traffic 131

Cost Scales for Territory 12, Total United States

78. Carload Commodities Moving in Box Cars 133-134
79. Carload Commodities Moving in Flat Cars 135-136
80. Carload Commodities Moving in Gondola and Hopper Cars 137-138
81. Carload Commodities Moving in Tank Cars 139-140
82. Carload Commodities Moving in Stock Cars 141
83. Carload Commodities Moving in Refrigerator Cars 142
84. Less-carload Traffic 143

Miscellaneous

85. Statement of Loss and Damage Payments by Commodity Groups for 1939 145
86. Statement of Territorial Average Tare Weights and Ratios of Empty to Loaded Car-miles by Classes of Equipment for 1939 146
87. Territorial Summary of Aggregate Costs, Aggregate Units, Unit Costs, and the Computation of the Territorial Allowances for Less-carload Deficit, Passenger Deficit, and Return on the Value of the Property 147-151
88. Statement Showing the Procedure Used in the Assembly of Carload Unit Costs for the Purpose of Computing the Carload Cost Scales 152
89. Statement Showing the Procedure Used in the Assembly of Less-carload Unit Costs for the Purpose of Computing the Less-carload Cost Scales 153
90. Average Load per Car by Commodities and by Districts and Regions 154
Map Showing the Territories for Which Costs Were Developed .... Frontispiece

1/ Based on a tare weight of 21.1 tons and a ratio of empty car miles to loaded car miles of 0.284. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes; plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage paym per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter hav been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 1 (Concluded).—TERRITORY NO. 1 - NEW ENGLAND

1/ Based on a tare weight of 21.1 tons and a ratio of empty car miles to loaded car miles of 0.284. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

5272

1/ Based on a tare weight of 19.5 tons and a ratio of empty car miles to loaded car miles of 0.827. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 2 (Concluded).—TERRITORY NO. 1 - NEW ENGLAND

CARLOAD COST SCALES FOR COMMODITIES MOVING IN FLAT CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 19.5 tons and a ratio of empty car miles to loaded car miles of 0.827. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

5274

1/ Based on a tare weight of 21.1 tons and a ratio of empty car miles to loaded car miles of 0.886. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 3 (Concluded).--TERRITORY NO. 1 - NEW ENGLAND

CARLOAD COST SCALES FOR COMMODITIES MOVING IN GONDOLA AND HOPPER CARS

1/ Based on a tare weight of 21.1 tons and a ratio of empty car miles to loaded car miles of 0.880. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

1/ Based on a tare weight of 22.8 tons and a ratio of empty car miles to loaded car miles of 0.993. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 4 (Concluded).—TERRITORY NO. 1 - NEW ENGLAND

CARLOAD COST SCALES FOR COMMODITIES MOVING IN TANK CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 22.8 tons and a ratio of empty car miles to loaded car miles of 0.993. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

1/ Based on a tare weight of 20.4 tons and a ratio of empty car miles to loaded car miles of 0.981. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

1/ Based on a tare weight of 27.3 tons and a ratio of empty car miles to loaded car miles of 0.862. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.22.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.32.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.17.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.65.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.86.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

5280

1/ Based on a tare weight of 21.1 tons and a ratio of empty car miles to loaded car miles of 0.284. The Less-carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Less-carload operating expenses, rents and taxes, plus a return at 4 percent upon the less-carload portion of the value, multiply by 1.22.

For Cost Level III(b), Less-carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the less-carload portion of the value, multiply by 1.31.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds on less-carload traffic. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

1/ Based on a tare weight of 23.3 tons and a ratio of empty car miles to loaded car miles of 0.350. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 8 (Concluded).—TERRITORY NO. 2 - EASTERN, excluding New England and Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN BOX CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 23.3 tons and a ratio of empty car miles to loaded car miles of 0.350. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 9.—TERRITORY NO. 2 - EASTERN, excluding New England and Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN FLAT CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 20.6 tons and a ratio of empty car miles to loaded car miles of 0.839. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 9 (Concluded).—TERRITORY NO. 2 - EASTERN, excluding New England and Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN FLAT CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 20.6 tons and a ratio of empty car miles to loaded car miles of 0.839. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 10.—TERRITORY NO. 2 - EASTERN, excluding New England and Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN GONDOLA AND HOPPER CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

Miles	Net load in tons per car																														Miles

1/ Based on a tare weight of 22.1 tons and a ratio of empty car miles to loaded car miles of 0.843. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 10 (Concluded).—TERRITORY NO. 2 - EASTERN, excluding New England and Northern Illinois

1/ Based on a tare weight of 22.1 tons and a ratio of empty car miles to loaded car miles of 0.843. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 11.--TERRITORY NO. 2 - Eastern, excluding New England and Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN TANK CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 22.8 tons and a ratio of empty car miles to loaded car miles of 0.982. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 11 (Concluded).--TERRITORY NO. 2 - Eastern, excluding New England and Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN TANK CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 22.8 tons and a ratio of empty car miles to loaded car miles of 0.982. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 12.--TERRITORY NO. 2 - EASTERN, excluding New England and Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN STOCK CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 20.9 tons and a ratio of empty car miles to loaded car miles of 1.006. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 13.—TERRITORY NO. 2 - EASTERN, excluding New England and Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN REFRIGERATOR CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 27.3 tons and a ratio of empty car miles to loaded car miles of 0.869. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.13.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.46.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.60.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 14.—TERRITORY NO. 2 - EASTERN, excluding New England and Northern Illinois

LESS-CARLOAD COST SCALES BASED ON SHIPMENTS MOVING IN BOX CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 23.3 tons and a ratio of empty car miles to loaded car miles of 0.350. The Less-carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Less-carload operating expenses, rents and taxes, plus a return at 4 percent upon the less-carload portion of the value, multiply by 1.21.

For Cost Level III(b), Less-carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the less-carload portion of the value, multiply by 1.30.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds on less-carload traffic. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

1/ Based on a tare weight of 23.3 tons and a ratio of empty car miles to loaded car miles of 0.350. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.14.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.47.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.62.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 15 (Concluded).—TERRITORY NO. 3 - EASTERN, excluding New England but including Northern Illinois

1/ Based on a tare weight of 23.3 tons and a ratio of empty car miles to loaded car miles of 0.350. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.14.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.47.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.62.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 16.—TERRITORY NO. 3 - EASTERN, excluding New England but including Northern Illinois

1/ Based on a tare weight of 20.6 tons and a ratio of empty car miles to loaded car miles of 0.839. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.14.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.47.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.62.

Note: The above costs do not include an allowance for loss and damage. See Table [illegible] herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 16 (Concluded).—TERRITORY NO. 3 - EASTERN, excluding New England but including Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES IN FLAT CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 20.6 tons and a ratio of empty car miles to loaded car miles of 0.839. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.14.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.47.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.62.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 17.—TERRITORY NO. 3 - EASTERN, excluding New England but including Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN GONDOLA AND HOPPER CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 22.1 tons and a ratio of empty car miles to loaded car miles of 0.843. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.14.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.47.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.62.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 17 (Concluded).--TERRITORY NO. 3 - EASTERN, excluding New England but including Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN GONDOLA AND HOPPER CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 22.1 tons and a ratio of empty car miles to loaded car miles of 0.843. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.14.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.47.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.62.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 18.—TERRITORY NO. 3 - EASTERN, excluding New England but including Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN TANK CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 22.8 tons and a ratio of empty car miles to loaded car miles of 0.982. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.14.

For Cost Level V(a), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.47.

For Cost Level V(b), Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, and a return at 5-3/4 percent upon the total value, including the less-carload and passenger portion, multiply by 1.62.

Note: The above costs do not include an allowance for loss and damage. See Table 85 herein for loss and damage payments per 100 pounds by commodity groups and by territories. Payments to be added to cost scales after latter have been increased by ratios shown.

See Text, Chapter I, for a discussion of the economic significance of each of the above levels of cost.

2/ Terminal expenses per 100 pounds. Includes those expenses which are independent of the length of haul.

3/ Line-haul expenses per 100 pounds per mile. Includes those expenses which are variable with the length of haul. The factors shown for terminal and line-haul expenses were those used in compiling the cost scale.

TABLE 18 (Concluded).—TERRITORY NO. 3 - EASTERN, excluding New England but including Northern Illinois

CARLOAD COST SCALES FOR COMMODITIES MOVING IN TANK CARS

Cost in Cents per Hundred Pounds, Based on Freight Operating Expenses, Rents and Taxes for 1939 1/

1/ Based on a tare weight of 22.8 tons and a ratio of empty car miles to loaded car miles of 0.932. The Carload cost study provides for several levels of cost. Cost Level II is that shown in this table. Compute the cost for other levels by multiplying the costs shown herein by the ratios shown below. The return is computed at both 4 percent and 5-3/4 percent.

For Cost Level III(a), Carload operating expenses, rents and taxes, plus a return at 4 percent upon the carload portion of the value, multiply by 1.21.

For Cost Level III(b), Carload operating expenses, rents and taxes, plus a return at 5-3/4 percent upon the carload portion of the value, multiply by 1.30.

For Cost Level IV, Carload operating expenses, rents and taxes, plus the passenger and less-carload operating deficits, but excluding return, multiply by 1.14.
